FDA is not requiring the ADJECTIVE format for the following reasons. The agency agrees that the ADJECTIVE format showed weakness on an important label use task, the product comparison task that required detecting differences between nutrients. The agency also agrees with the comments that argued that the wide range for some of the adjective categories may be misleading to consumers who use the label in certain ways. The agency acknowledges that the ADJECTIVE format was the most preferred in some studies but notes that preference measures must be interpreted cautiously and cannot be used as a definitive criterion, for the reasons discussed in section V.D.3. of this document. The agency further notes that none of the studies provided evidence that the ADJECTIVE format is easier for elderly consumers to use.

7. GROUPING Format

Grouping by whether dietary guidelines recommend choosing a diet high or low in specific nutrients was tested in FDA's Study 2 (Ref. 70). This format element did not generate many comments, and the comments about it were frequently included in statements about the HIGHLIGHTING or ADJECTIVE format. Most of the comments were opposed to GROUPING.

153. One argument against the GROUPING format was that it is too value-laden, lending itself to a good–bad food message. Another comment argued that the GROUPING format does not provide meaningful information related to the particular product. Other related comments argued that the GROUPING format did not have good performance characteristics in research, and that subjects reported that they found it too prescriptive. Some comments argued that it would be confusing to consumers in general, and one comment argued that it would be especially confusing to consumers with diabetes.

The agency agrees with these comments. FDA's research showed that the GROUPING format did not perform well on the dietary management tasks and did not offer any significant advantages over other formats (Ref. 70). In addition, although the format was not strongly disliked, many subjects who disliked it reported that they found it too prescriptive. This complaint is consistent with the complaints of many of the comments.

The agency has decided not to require that nutrients be listed under the

GROUPING format headings for the reasons discussed in the paragraphs above and below.

154. A few comments argued that the GROUPING format would be a challenge to implement because adequate consensus does not exist on where to place some subcomponents, such as polyunsaturated fats. In addition, comments challenged the format because its recommendations are not entirely consistent with those of the dietary guidelines. For example, the dietary guidelines recommend moderate intake of some nutrients, such as sodium, but the GROUPING format recommends low intake.

The agency agrees that the placement of some nutrients and nutrient subcomponents is problematic under the GROUPING format. This problem in placing all nutrients is one of the reasons the agency has decided against the GROUPING format.

155. Several comments in support of the GROUPING format argued that it provides nutrition education by stating which nutrients should be eaten in greater and lesser amounts. A few comments argued that the proposed order of nutrients on the label tends to group them into those targeted for lower and higher intakes, so that the GROUPING format is unnecessary with the new nutrient order.

FDA agrees that the intent of the grouping format is to provide general dietary guidance. However, the fact that the format did not offer significant advantages over other formats on any performance measure considered in the consumer research shows that dietary guidance as offered in this format did not benefit consumers. The proposed new order of nutrients uses the widely accepted design of placing first the elements of greatest importance and is intended to accomplish some of the goals of the GROUPING format. The GROUPING format's failure to convey the intended dietary guidance, as measured in the consumer research (Ref. 70), is one of the reasons the agency has decided against this format.

8. Modified Grouping Format

A few comments mentioned the Modified Grouping format in which the order of the nutrients changed according to the amount in the product.

156. Almost all comments were opposed to the Modified Grouping format. The major argument against it was that it would reduce consistency and increase confusion among consumers. Comments stated that using this type of format is especially difficult for older people, who have a particular need for nutrition information. As the population ages, larger numbers of consumers will have difficulty with such a format.

The agency agrees with this argument and notes further that available research shows that with advancing age, consumers have increasing difficulty extracting relevant information from displays in which the order of nutrients vary (Ref. 104).

The agency is not requiring the Modified Grouping format because it has no reason to believe that this format would meet the requirements of the 1990 amendments for the reasons stated above. The agency further notes that consistency of placement of nutrition information is a principle that has guided the development of the new format because such consistency has been shown to help consumers, as noted above.

9. CONTROL Format With DV Ranges

In its format proposal (57 FR 32058 at 32072), the agency discussed several alternative formats to those tested by the agency. For those reference values based on caloric intake, one alternative was the use of a range of DV's based on a caloric intake range instead of a single caloric intake value (Appendix E in the format proposal). The agency requested comment on this alternative.

157. Comments were evenly divided concerning the use of ranges for DV's. A number of comments, primarily from food industry representatives, supported the use of a range for the DV's because a range could assist consumers in realizing that nutritional needs vary with individuals, and ranges are easier for consumers to work with than single DV values. Others supported the use of a range because the use of a specific reference value would cause consumers to conclude that the values applied directly to them as individuals. Several comments suggested specific caloric ranges to be used (including 1600 to 2800, 1600 to 2400, and 1500 to 2800).

A number of comments from a variety of groups, including consumer advocates and the food industry, argued against the use of ranges. Reasons for opposing the use of ranges included concerns that ranges would be confusing to consumers, that they would overwhelm consumers, that they are too broad to be meaningful, that they use more label space than single values, that consumers would not be able to calculate their reference value from a range, and that they have not been evaluated in appropriately designed studies to determine if they would be more effective and less misleading than a single value. One comment cited research conducted for the purposes of developing a dietary guidance graphic (Ref. 105) that showed that consumers experienced difficulties using a range of values relative to dietary guidance.

FDA has carefully considered these comments and concludes that there is not sufficient support, nor a substantial rationale, for providing reference values as a range. The agency notes that no comment contained research or other data to substantiate the utility or appropriateness of ranges. No evidence shows that consumers do in fact find ranges easier to work with, and no data suggest that ranges are less likely than single values to confuse or mislead consumers. In fact, the agency has reviewed the literature on how people assign magnitude to numbers (e.g., Ref. 120). This literature concludes that in order to estimate magnitude, people generally have to answer the question, "compared with what?" usually invoking a norm or reference standard as a context for comparison. The DV is intended to be such a reference standard. When expressed as a range, the value of the DV as a norm against which the level of the nutrient can be understood is compromised because the norm cannot be easily identified without additional assumptions and computations. Thus, the use of ranges is inconsistent with the 1990 amendments, which require that nutrition information be conveyed in a manner that allows consumers to comprehend the nutrition information (section 2(b)(1)(A) of the 1990 amendments). Ranges apparently have the opposite effect.

The agency is also concerned that the use of ranges would mislead some consumers to believe that the consumption of a nutrient at any level within the declared range is appropriate for them. For consumers whose calorie intake is at the middle or low end of the range, however, the label could induce consumption of nutrients such as fat or saturated fat in excess of the dietary guidelines, which would adversely affect public health.

For these reasons, FDA has rejected the presentation of reference values as ranges. The argument that consumers need assistance to realize that nutritional needs vary with individuals has been addressed by requiring daily value information for 2,000 and 2,500 calorie diets.

10. CONTROL Format With Sex-specific Daily Values

158. A few comments supported reference values based on gender (Appendix E in the format proposal). One comment suggested that gender specific reference values were appropriate because women have

different nutritional requirements than men. Other comments opposed the use of separate reference values for men and women. The primary concerns were the issues of space, readability, and clutter on the label. One comment suggested that the format presented too much information for the consumer to process. The same comment opposed gender-based reference values because their use did not recognize that some active women are more like men in terms of their calorie need, while some older men have calorie needs more like those suggested for women. Several comments argued that gender is only one factor to consider in determining an individuals's dietary intake, and therefore its presentation on the label has the potential of inappropriately emphasizing one factor.

While the agency acknowledges that women in general have different nutritional needs than men, FDA notes that such comparisons can be made for a variety of groups comprised of persons 4 or more years of age. Thus, the agency agrees that the use of gender specific reference values may inappropriately emphasize only one factor in evaluating dietary intake. However, the agency agrees that examples of recommended nutrient amounts for different calorie level intakes may help consumers to estimate their personal daily recommendations. Therefore, as discussed in comment 139 of this document, FDA is requiring the inclusion of recommended nutrient amount information for 2,000 calorie and for 2,500 calorie diets in the nutrition information.

11. CONTROL Format With dietary guidance

159. A number of comments, primarily from industry, supported the CONTROL Format with Dietary Guidance (Appendix F in the format proposal). Several comments supported this format on the basis that it was most like the current format and therefore familiar to consumers. Two comments argued that FDA should select the CONTROL Format with Dietary Guidance because USDA prefers it, and harmonization between the two agencies is important. Supporting comments argued that this format helps consumers to put the food in the context of a total daily diet, reinforces the dietary guidelines, and is simple and uncluttered. One comment suggested that the caloric equivalents of the macronutrients may enable consumers to better utilize the information provided.

The major arguments against CONTROL with Dietary Guidance were that the information is too vague to be effective and adds clutter to the label. Some of these comments noted that the footnote discusses foods when the information on the label is about nutrients, so that, except for vague information about fat, no relevant information about recommended nutrient amounts is available on this label. Several comments argued that it would not be clear to consumers that the dietary guidance information applied to total diet and not to individual foods. Other comments noted that because this format has not been tested, the agency has no basis to assume that consumers will be able to relate the dietary guidance to the nutrition information. Comments also pointed out that many calculation steps and further instruction would be required to apply the dietary guidance to the consumer's daily diet.

Some comments noted that the dietary guidance footnote would be problematic for meat products because it recommends a diet high in vegetables, fruits, and grain products, which might imply to consumers that they should not eat meat.

The agency does not agree that CONTROL with Dietary Guidance format as shown in the format proposal is consistent with the requirements, or effective for meeting the objectives, of the 1990 amendments. The addition of the dietary guideline and calorie conversion information does not serve to put the levels of nutrients in the food into the context of a daily diet. However, the format includes information that helps consumers to understand the significance of the nutrient levels in the food.

Therefore, the agency is incorporating one of the elements from this proposed format as a mandatory requirement of the nutrition label format. Specifically, FDA recognizes that it will be useful to some consumers to have the caloric conversion factors on the label. The placement beside the nutrient names as shown in Appendix F of the format proposal is not acceptable, however, because the g/mg amounts will be placed beside the nutrient names in the required format. Both pieces of information on the same line would decrease or eliminate the spacing that helps to make the format comprehensible. Therefore, the agency is requiring that the caloric conversion factors be included on the nutrition label as a footnote, as described in § 101.9(d)(10).

12. New Formats Submitted as Comments

160. One comment suggested a format for the nutrition label quite different from any other format suggested and quite different from any format that had been previously tested. Called a graphical profile, the format expressed quantitative nutrition information in terms of distance along a spoke radiating from a central point, where each spoke represented a mandatory nutrient component. The points on each spoke were connected with each other to form a pattern that distinctively identified the nutrient profile for the product. The comment claimed that the format has a number of advantages, including: (1) Providing consumers with easily remembered mental "shapes" of the products that they wish to consume or avoid and (2) helping consumers to place the food in the context of a total daily diet by allowing for easy comparison between the shape of the nutrient profile for the product and an ideal shape based on dietary recommendations.

FDA is impressed by the ingenuity of this format but is convinced that such an innovative format for the nutrition label cannot be required without extensive consumer testing. No consumer research to support use of this format to accomplish the requirements specified in the 1990 amendments was submitted. Furthermore, FDA notes that the format encourages a comparison between the specific food and the dietary guidelines, whereas the recommended comparison is between the total daily diet and the dietary guidelines. Therefore, FDA is not adopting the graphical profile format. The agency is prepared to work with interested persons to develop consumer research that would show the usefulness and validity of this format.

H. Graphic Enhancements and Format Elements

The agency received numerous comments concerning the various format elements and graphic enhancements discussed and illustrated in the format proposal.

1. Format Legibility

161. Many comments, particularly from older and vision-impaired consumers and from organizations and health care professionals serving their needs, suggested that the legibility of nutrition information should be improved through regulations specifying larger sized or boldface type, easier to read type styles, use of upper and lower case letters, minimum type

spacing, and greater color contrast between print material and background, such as black lettering on white background. An alternative suggestion was for FDA to specify minimum print size and color contrast.

A number of comments from package designers and from individual food companies pointed to the problems in requiring graphic elements that add to the space requirements for the nutrition label, given the limited size of many packages and the competition for label space from other required or desirable information (e.g., UPC information, storage and preparation instructions, recipes). Other comments urged the agency to set minimal and flexible standards for graphic requirements related to readability that would allow manufacturers to accommodate the wide variation in package sizes, package shapes, and current graphic elements on packages.

The agency recognizes that mandating graphic elements to assure a desirable level of readability for the required nutrition information has both advantages and disadvantages, particularly when these elements may require more space. The agency agrees that some flexibility in the mandated graphical elements is necessary in order to accommodate the wide range of packages on which the information will appear. However, FDA also agrees with the comments that stated that the readability of the nutrition label needs to be improved to help older and vision-impaired consumers who otherwise would be effectively denied access to nutrition information of food packages. The agency points out that, as stated in the format proposal (section V.B.), certain graphic techniques go directly to the requirements in the 1990 amendments (section 2(b)(1)(A)) that the information be presented in a way that enables consumers to readily observe the information.

With the aim of achieving minimal readability standards for the required nutrition information, FDA has developed for use in this document, and in the presentation of the new label, a format design that incorporates many of the graphic elements suggested by the comments to produce a more readable label. FDA agrees with comments that argue that a consistent "look" to the required nutrition information on food packages will help consumers to find the information on the package and to recognize the information for what it is—a profile of the nutrient content of the food. Although FDA is providing for some flexibility in label execution, companies are encouraged to use this label as a model for designing labels for their packages (see section 101.9(d)). The specifications for this presentation of the graphical elements are included in the Code of Federal Regulations as appendix B to part 101.

FDA understands that some flexibility in execution of the nutrition label is necessary to accommodate various package sizes and shapes and current graphic features that serve as brand identifiers. For these reasons, a number of graphic alternatives to the model label are permitted. For example, § 101.9(d)(11) allows the footnote to be moved to the right of the percent DV information if space is not adequate beneath the vitamin and mineral information, and § 101.9(d)(8) allows for a vertical display of vitamin and mineral information when more than four vitamins and minerals are declared.

In addition, although the model label calls for dark or one color type on a white or neutral color background, flexibility in background and type color is allowed § 101.9(d)(1)(i). FDA is aware that some products traditionally use color as a brand identifier and print nutrition information in white or neutral color type on a darker color background. This type of graphic technique, called "reverse type," is known to have poorer readability characteristics than regular type. FDA is not prohibiting the use of reverse type. However, FDA expects that unless impractical, the nutrition information will be presented in dark type on a light color background. Impracticability is presented by situations like those described above, in those situations in which reverse type will be significantly less expensive than the FDA preferred alternative, or in other similar appropriate circumstances. If reverse type is used, FDA expects that the impairment in readability resulting from such a technique will be compensated for by the use of other graphic techniques to improve readability, such as increased type size. It will not be acceptable to reduce the contrast between print and background, whether by light letters on a light background or dark letters on a dark background, to the point where readability of the label is significantly degraded.

Although the agency is committed to the flexible application of graphic techniques to achieve an acceptable level of readability for the required nutrition information, FDA considers it necessary in order to ensure that the nutrition information is conveyed in a manner that enables the public to readily observe and comprehend such information to set minimal standards and requirements for certain key graphic elements of the nutrition label. Such requirements will prevent confusion about the minimal level of readability that is necessary for the nutrition information. The key graphic elements that are specifically required on all packages are set forth in §§ 101.9(d)(1)(ii), 101.9(d)(1)(iii), and 101.9(d)(1)(iv). They consist principally of type size and type style requirements, namely that a consistent upper and lower case type style be used, that a single, easy-to-read type style be used, that product information be in at least 8 point type (the lower case "o" no smaller than 1/16th inch) with at least 2 points leading (i.e., space above and below letters) and kerned (space between letters) no tighter than −4 setting, and that headings, certain nutrient names, and percentage amounts be highlighted by bolding or other form of highlighting.

In addition, to preserve a readily identifiable image or "look" for the label, a number of other graphic elements are required, as discussed in § 101.9(d)(1)(i), (d)(1)(v), (d)(2), and (d)(7)(ii). These sections require a hairline box to set off the nutrition information, hairline rules in certain places within the nutrition label, larger print size for the title, "Nutrition Facts," and display of the percent sign (%) after the numerical value of the percent DV for each nutrient.

FDA has been persuaded by comments and careful consideration of alternatives that these requirements will benefit a substantial number of consumers who currently have difficulty reading nutrition information on food packages. FDA considers this benefit to be worth the cost of the small increase in space allotted to nutrition information that may be required for some food packages. The agency notes that the previous regulations on type size also mandated a minimum type size for the lower case "o" of 1/16th inch but applied the same minimum type size requirement to the upper case "o" as well, which resulted in most manufacturers using all upper case type styles. The practical effect of requiring upper and lower case type styles and keeping the same minimum type size requirement will be to increase the minimum size of upper case letters by approximately 30 percent. To further compensate for the increased demands on label space, FDA will allow the information in the footnote, which unlike the product specific information is the same for all products, to meet or exceed a 6 point type minimum type size requirement. FDA considers that the requirements for upper and lower case type styles, leading, and kerning will enhance the readability of 6 point

type enough that it will not present problems for most consumers.

2. Other Graphic Enhancements

162. Several comments from retailers, manufacturers, graphics designers, universities, and a nutrition professional group were directed specifically at reverse printing as used in the graphic adaptations of appendix C of the proposal. Two comments stated that reverse printing would be helpful to consumers and should be permitted on a voluntary basis. However, the remaining comments addressed technical or legibility problems. Several comments stated that the format examples were not readable, that the reverse printing overwhelmed the smaller type, and that "stacked" titles (i.e., with components arranged vertically, e.g., placing "servings" on one line and "per container" on the next line) were confusing. The principal technical problem mentioned was that reverse printing tends to fill in and become unreadable, depending on the printing process used and available label area.

One manufacturer of many products stated that only two out of four printing processes used by the firm would be able to implement the graphic adaptations of appendix C. Another manufacturer stated that it would be able to print reverse graphics only for large containers. A graphics design firm stated that reverse printing adds significant costs. Another design firm cited two technical barriers to reverse printing: Multi-screen labels are difficult to hold in alignment and retain clarity, and reverse printing cannot be applied to packages with light backgrounds because the background must be dark for light, reverse print, to show through. The comments stated that many brand identification colors are light, and manufacturers object to having to change them, arguing that brand identification would be lost.

FDA agrees that reverse printing should not be required, given the difficulties mentioned in the comments. The agency finds convincing the arguments against the legibility of reverse print discussed in the professional literature (Ref. 107).

Because of the need for flexibility to place the nutrition panel in variously sized panels, the agency does not object to stacked titles.

163. The majority of comments stated that other kinds of graphic enhancement of nutrition information, such as underlining, bolding, and using larger type size or contrasting color, would encourage and assist consumers in using the information. However, opinions were divided as to whether the combination of enhancements illustrated in appendix C of the proposal would be helpful. A number of comments criticized the graphic adaptations as cluttered, jumbled, obtrusive, or distracting from or overwhelming the smaller type. However, except for a few suggestions that graphic enhancements be entirely at the discretion of the manufacturer, the comments favored some degree of standardization through FDA regulations. Comments frequently stressed the need for uniformity of appearance of labels across the food supply to facilitate education efforts and consumer access to and use of the nutrition information.

Several comments from consumers, a graphics designer, and a nutrition professional group stated that the number of different font sizes on a label should be minimized to ensure legibility. One comment cited a book in support of this view (Ref. 108). Several comments urged FDA to keep the label uncluttered. Other comments provided specific guidelines for maximizing the label's usefulness. These guidelines generally involved removing as much print as possible, keeping titles linear rather than stacking them, and including only essential information.

Several comments from industry and health education organizations endorsed voluntary, judicious use of other graphic enhancements such as spacing, indentation, use of upper and lower case letters, and selection of type face and size. These comments generally opposed making such enhancements mandatory until consumer research is conducted to ensure that they effectively aid consumer comprehension. Other comments from groups representing older readers and the vision impaired provided research demonstrating the importance of type size, type style, type spacing, the use of upper and lower case letters, and contrast between type and background to these readers. A consumer organization suggested that FDA establish an advisory committee of experts to provide guidance for the selection of graphic devices for further consideration. Two manufacturers opposed graphic enhancements altogether as contrary to the requirements of 1990 amendments for consistency in presentation of information. One comment characterized the combination of extreme bolding and close proximity of columns in the graphic adaptation of the PERCENT DV with DRV format as diverting attention from the quantitative values and stated that, with respect to the objectives of the 1990 amendments, the format constitutes near misbranding.

Based on the research submitted in comments, the agency is convinced that it can proceed to require certain graphic enhancements. While some comments questioned the appropriateness of requiring such enhancements at this time, other comments submitted research that demonstrated that these enhancements are effective and appropriate for creating a nutrition label that is readily observable and comprehensible, as required by the 1990 amendments. The agency agrees that keeping the format uncluttered is important and therefore has minimized clutter in the model format. The agency has carefully considered which format enhancements to combine, based on the comments and the research presented.

FDA is convinced that the specific elements mandated provide a visually integrated image that will give the nutrition label a uniformity of appearance across the various types of packages in the market and will enhance consumer use of the information. For example, an important element in the appearance of the nutrition label is its pattern of bolding. In § 101.9(d)(1)(iv), the agency is requiring bolding of the heading "Nutrition Facts" which is being employed as an identifying title, like a logo or trademark, to distinguish the nutrition label from other information on the package, as well as bolding of headings of certain nutrient names and percentage amounts. The agency is convinced that this and the other measures that it is requiring will serve to establish the readily identifiable "look" that it is seeking and finds to be necessary to achieve the relevant goals of the 1990 amendments.

164. Comments were received from a consumer, a health care provider, a State government agency, and two manufacturers suggesting that industry be permitted to use graphical devices, such as pie charts, to illustrate nutrient content claims. Comments suggested that uniformity of labeling could be maintained by requiring that any supplementary graphics be placed outside the nutrition label area. Other suggestions were that FDA permit the voluntary inclusion on the label of information from authoritative sources, such as the Dietary Guidelines for Americans (Ref. 4) or Diet and Health (Ref. 3), to aid consumer understanding of nutrition information in the broader context of current dietary advice to the public.

FDA has no objections to the use of graphic devices to amplify or explain nutrition information, provided that the

illustrations are presented in a manner that is truthful and not misleading, and that the devices are not placed within the label area in which the nutrition information appears. The agency also agrees that supplementary information outside the nutrition label can help consumers better understand the characteristics of individual foods in relation to the total diet. However, such supplementary information must be consistent with the requirements for nutrient content or health claims that are established in companion documents published elsewhere in this issue of the **Federal Register**. Manufacturers are also encouraged to utilize other means to disseminate dietary guidance information, such as incorporation of such materials in promotional and print advertising materials or by means of shelf talkers and placards at point-of-sale.

165. Several industry comments requested that manufacturers be given flexibility, either in the case of small packages or in general, to declare vitamins and minerals and DRV's in either tabular or linear arrangement for both full and simplified formats. A manufacturer suggested permitting a linear array for micronutrients present at levels of at least 2 percent of the DV.

The agency agrees that manufacturers need flexibility in accommodating the required nutrition information, particularly for small packages and printable surface areas that are oddly shaped or narrow. Consequently, FDA is providing options in the display of a number of the types of information required. For example, in § 101.9(d)(ii), the agency is providing that the information about calorie-specific daily values and caloric conversion information may be placed beneath the vitamin and mineral declarations or to right of the Percent DV column. In § 101.9(d)(8), the agency is providing that the vitamin and mineral declarations may be presented vertically in the Percent DV column when more than four vitamins and minerals are declared or horizontally beneath the macronutrients. In § 101.9(f), the agency is providing for optional use of a simplified format under certain circumstances. In § 101.9(j)(13)(i), the agency is providing exemptions to the requirement to bear nutrition labeling for small packages, and in § 101.9(j)(13)(ii), the agency is providing options for intermediate sized packages to minimize the amount of label space that must be used for nutrition labeling. For small or intermediate sized packages, manufacturers may list nutrition information in a linear fashion, use certain abbreviations, omit the calorie-specific recommended nutrient amounts, or present the nutrition information on other label panels (see sections V.G.3., V.H.1., and V.J. of this document).

3. Highlighting

In the format proposal, the agency requested comments on the feasibility of allowing highlighting as a voluntary graphic enhancement of the principal format. Specifically, the agency requested comments related to whether the use of voluntary highlighting would confuse or assist consumers to observe and comprehend label information. Many different possible schemes for highlighting could be applied to the nutrition label. Many comments addressed noncontingent highlighting, in which certain material is highlighted regardless of any product characteristics, such as highlighting certain nutrient names (e.g., fat, sodium, cholesterol) or titles (e.g., Percent DV, Amount per serving) on the nutrition panel. Other comments addressed contingent highlighting, in which certain material is highlighted only if the product has certain characteristics, such as highlighting the nutrition information for fat on the label of a product that meets FDA's criterion for low fat. In it's research, the agency tested a contingent highlighting scheme that highlighted nutrients whose levels in the food qualified for adjectival descriptors (high or low depending on the nutrient) that were consistent with dietary guidelines.

Many different possible techniques of highlighting exist, including boldface print, all capital letters, italic print, larger print, reverse print, different colored print, and color banding. In the format examples published in the format proposal, only boldface print was used for highlighting.

166. Many of the comments that discussed noncontingent highlighting suggested that highlighting should be considered as a format enhancement and should be used for column headings and names of nutrients. Other comments argued that the agency should require the highlighting of certain nutrients because of their health significance regardless of the level in the product. The nutrients most frequently mentioned in the comments in this regard were those associated with chronic disease, such as sodium, fat, and cholesterol. Most of these comments suggested that boldface type and all capital letters are adequate to achieve such highlighting.

Several comments addressed the issue of whether noncontingent nutrition label highlighting should be mandatory or voluntary. Some manufacturers objected to any required highlighting because of the increased cost and increased label space required. Other comments argued that if highlighting is allowed at all, it should be mandatory so that the benefits of highlighting would be universally available to consumers, and so that labels would be uniform. Some of these comments argued that uniformity of labels is important to reduce consumer confusion.

The agency agrees than mandatory highlighting imposes some burden on manufacturers and needs to be justified on the basis of obvious benefits to consumers. The agency also agrees that the use of highlighting to enhance column headings and nutrient names can increase the visual interest of the label and make it more legible for some consumers.

However, the agency is concerned that allowing too many optional highlighting schemes will lead to less consistency between labels, and that highlighting has the potential to increase label clutter and consumer confusion. Therefore, in § 101.9(d)(i)(iv) the agency is requiring mandatory highlighting of the title of the nutrition panel, "Nutrition Facts", headings ("Amount per serving" and "% Daily Value"), nutrient names ("Calories", "Total Fat" "Cholesterol," "sodium," "total Carbohydrate," and "Protein") and percentage amounts for certain nutrients. The agency concludes that these requirements, by establishing a specific "look," strike an appropriate balance between establishing a nutrition label that is readily observable and one that only increases clutter and confusion.

The agency does not agree that nutrients associated with chronic disease should be highlighted. The agency notes that the revised order of the nutrients already calls attention to the nutrients of major public health significance.

167. Several comments supported or opposed the voluntary highlighting of certain nutrients based on their level in the product (contingent highlighting). Supporting comments, primarily from food manufacturers or trade associations, argued that allowing such highlighting would provide useful information to consumers. Opposing comments, primarily from health professionals, professional associations, and consumer advocate or health promotion organizations, argued that allowing contingent highlighting on a voluntary basis would likely lead to inconsistent and possibly self-serving

highlighting that would be more likely to misinform than inform consumers.

Several comments supported contingent highlighting but recommended that it be subject to the definitions used in FDA's research studies or to the requirements for nutrient content claims, because highlighting is a nutrient content claim. Related comments supported a link between a nutrient content claim on the front panel and highlighting the relevant information on the nutrition panel. For example, if a low fat claim is made on the front panel, the nutrition information for fat would be highlighted.

Some comments recommended that highlighting of undesirable rather than desirable aspects of foods be required because manufacturers will emphasize the good qualities, and such highlighting will provide a balance. In contrast, a trade association commented that the highlighting of "bad" nutrients should not be required because it would be misleading. Another comment suggested that highlighting be allowed only on a case-by-case basis so that both FDA and food manufacturers have maximum flexibility.

Some comments opposed highlighting and argued that attention should be drawn to specific nutrient levels by nutrient content claims rather than by highlighting. Other comments argued that the highlighting of positive information only will accentuate benefits without including information about risks and will lead consumers to ignore vital information on negative aspects of certain products. Several comments from industry were opposed to contingent highlighting because it would communicate a good food/bad food message. Several comments stated that highlighting will imply an educational message which is more appropriately addressed in educational materials.

Other comments opposed highlighting because, they claimed, FDA will not have adequate enforcement resources. Permitting voluntary highlighting will open the door for inappropriate use of highlighting, which will then require additional regulatory intervention. Another comment, consistent with comments about other forms of dietary guidance on the label, argued that selective highlighting based on current dietary recommendations will change over time, and that it is unwise to include shifting format elements on the label.

FDA is not persuaded by the comments that contingent highlighting on the nutrition label will benefit consumers. Consumer research did not find that contingent highlighting increases effective use of the nutrition label for product comparison or dietary judgment uses (see section V.D.2.a. and V.D.2.b. of this document). There is no consensus among the comments, and the consumer research does not support that requiring a particular contingent highlighting scheme is appropriate. FDA is persuaded by comments that voluntary contingent highlighting can be applied inconsistently in a way that would be potentially misleading to consumers. Among products with similar nutrition profiles, some would highlight certain nutrients and others would not. Consumers who read nutrition labels could not depend on the fact that all labels of similar products would look the same, and the differences could undermine the credibility of the information on the nutrition label and lead to consumer confusion.

The inconsistency of labels that would result also leads the agency to disagree that highlighting should be allowed on a case-by-case basis. Consistent treatment of similar information is important for effective use of the nutrition label by consumers. FDA agrees that attention can be drawn to the levels of specific nutrients in a food by nutrient content claims rather than by highlighting information on the nutrition label. Because of problems of inconsistent treatment of similar information and the lack of demonstrated benefits in the research, FDA is not allowing the use of contingent highlighting on the nutrition label.

4. Adjectives

168. A majority of the comments that addressed the issue of adjectives were in favor of their use in some context. Several consumer groups recommended that the PERCENT DV with DRV format be enhanced by a footnote providing FDA's definition of high and low for nutrients. The comments argued that adjectives help consumers to make qualitative judgments about the food without having to make calculations or evaluate percentages. Some comments noted that the ADJECTIVE format was the most preferred in FDA's research.

In contrast, comments opposed to adjectives in the nutrition label argued that they clutter the format and would be redundant with PERCENT DV formats. Comments also expressed the concern that the wide range of values that will fall in the medium category may mislead consumers.

The agency does not agree that there is a need to include adjectives on the PERCENT DV with DRV format. The agency's research showed that consumers are able to make accurate high/low judgments using percents alone, and that when consumers relied on adjectives (see section V.D.2.a. above), they tended to overlook nutrient differences if the nutrients were described by the same adjective. The additional words would add clutter to the label without benefit to consumers. Therefore, FDA is not providing for the addition of adjectives to the PERCENT DV with DV format.

I. Dual Declarations

A few comments raised format issues with respect to foods that use dual declaration displays on the nutrition label (i.e., nutrition information declared both on as packaged/as prepared or per serving/per 100 g bases) A number of issues related to the topic of dual declarations are discussed in detail in the companion document on serving sizes published elsewhere in this issue of the **Federal Register**. FDA recognizes that such displays raise special format issues, and these are discussed here.

169. One trade association comment urged that FDA consider the label space requirements of dual declaration formats before deciding to require a change in the current nutrition label format. Several comments stated that the PERCENT DV with DRV format would not leave room enough for both "as packaged" and "as prepared" columns on nutrition labels. One industry comment stated that industry sponsored research has shown that the PERCENT DV with DRV format becomes particularly complex and cumbersome when used on food labels using dual declaration displays.

FDA agrees that dual declaration displays have much greater space requirements than the single base display required for most food products. FDA notes, however, that dual declaration displays are voluntary, not mandatory. For this reason, FDA does not agree that the requirements of dual declaration displays should be a determining factor in the decision about the nutrition label format. However, FDA does agree that the unique requirements of dual declaration displays should be accommodated as much as possible within the constraints of the format that is required for all nutrition labels, and the agency therefore has created a new section, § 101.9(e), to specifically address the format of the nutrition label when dual columns are utilized.

FDA notes that several studies submitted as comments or listed in the format proposal found that dual

declaration displays of any kind made the product nutrition label significantly harder for consumers to use and understand (see section V.D.2. of this document). The execution of dual declaration displays for the PERCENT DV with DV format in the GMA/NFPA industry study (Ref. 71) demonstrated the problem with multiple column displays on the nutrition label. In that study, a number of the dual declaration displays placed both g/mg and PERCENT DV declarations in separate columns on the nutrition label, resulting in as many as five columns of information when DV's were listed. The display was complex and cumbersome, but it is not the only, and certainly not the best, way to execute the PERCENT DV format with dual declarations.

FDA's execution of the PERCENT DV format in Study 2 (Ref. 70) purposely arranged the percent declarations in two columns and presented a single g/mg declaration per nutrient in a noncolumn array next to the nutrient name so as not to intrude visually on the columns of percents. With this execution, the PERCENT DV with DRV format performed as well as other formats on labels using dual declaration displays. The agency is convinced that dual declaration executions of the PERCENT DV with DV format should follow the pattern of minimizing the number of columns displaying nutrient amount per serving information. Accordingly, in § 101.9(e) the declaration of the required g/mg nutrient amounts on dual declaration nutrition labels is required to follow the same requirements as for single declaration nutrition labels, which is to be in an unordered array next to the nutrient name. Placement of optional g/mg amounts is discussed in comment 170 of this document.

170. A comment argued that declaring two g/mg amounts in parentheses next to the nutrient name as proposed in the dual declaration format example included in the format proposal looks like "matrix coordinates" and is likely to be confusing to many consumers. One comment suggested an alternative for presenting dual declaration g amounts. The comment suggested that only the g/mg amounts of the product as packaged be in the table, and that a footnote provide the additional amounts in the second declaration for the food.

FDA agrees that even when presented in a noncolumn array, the declaration of two g/mg amounts for each nutrient on the nutrition label (e.g., one each for as packaged/as prepared or per serving/per 100 g) in addition to two columns of percent DV amounts for nutrients having DV's is likely to be cumbersome and confusing to some consumers. Based on the research findings (see section V.D.2. of this document), FDA is confident that a single g/mg amount declared in a noncolumn array does not have a detrimental effect on consumers' abilities to understand and use the nutrition information on the label, but FDA did not test a format with two g/mg amounts for each nutrient. FDA is convinced by this comment that only a single g/mg amount (as packaged and according to the label serving size based on reference amounts in § 101.12(b)) for each nutrient should be required in dual declaration labels. The second set of g/mg amounts may be presented optionally next to the required g/mg values, differentiated from them by a comma or other means. Alternatively, the second set of g/mg amounts may be presented in a footnote. When the second set of g/mg amounts is presented in a footnote, either the total amounts or the additional amounts may be declared. When the additional amounts are declared, only those nutrients that are present in different amounts than the amounts declared in the required g/mg information may be listed. The footnote must clearly state which amount is declared. The agency has included this provision in § 101.9(e)(3)(i).

Examples of nutrition label formats for products using a dual declaration display that conforms to the new regulations are presented in appendix E.

J. Simplified Format

Most comments from consumers, industry, and professional organizations supported the concept of using a simplified format stating that it is easier for consumers to understand, cuts down on label clutter, and gives manufacturers flexibility in preparation of labels. The comments and FDA's response to concerns raised by the comments are summarized below.

1. Terminology

171. A few comments commended FDA and USDA for attempting to bring consistency to nutrition labeling regulations by allowing for similar types of simplified formats but requested that the two agencies use the same term rather than "simplified" format in FDA regulations and "abbreviated" format in USDA regulations.

Both FDA and USDA are in agreement with these comments. In accordance with the language in the 1990 amendments, they will use the term "simplified" format. However, because the foods regulated by each agency are different, the specific regulations pertaining to the simplified format will differ somewhat by agency.

2. Required Use and Criteria

172. Several comments disagreed with FDA's interpretation of that part of section 403(q)(5)(C) of the act which states "the Secretary *shall require* the amounts of such nutrients to be stated in a simplified form * * * " (emphasis added) to mean that foods that qualify for the simplified format must use that format, i.e., they may not choose to use the full nutrition labeling format. These comments urged that use of the simplified format be optional as, in some instances, consumers may be better served by one uniform nutrition label, and manufacturers should be given the flexibility to meet consumer preferences. In support of such labeling being voluntary, the comment cited the following legislative history:

> However, the bill provides that the Secretary *may permit* the information to be included on the label or labeling in a simplified form if a food contains insignificant amounts of more than one-half of the nutrients required to be on the label. (emphasis added)

(Ref. 16)

FDA advises that the draft legislation was revised by the Senate subsequent to the above House report to replace the word "may" with "shall" and to add that the form of the simplified format was to be "prescribed by the Secretary" (136 Congressional Record, S. 16607 (Oct. 24, 1990)). The changes were not explained in legislative history, so that the intent of Congress is not clear. The agency acknowledges that it is possible that Congress was merely trying to require that the final regulations provide for a simplified format rather than requiring that the format be used whenever a food met the qualifying criteria. In fact, inasmuch as the intent of the 1990 amendments was to increase the amount of nutrient information provided to consumers, it is not entirely consistent that the act would require less information on certain foods.

Based on reassessment of the statute and its legislative history in response to the comments, FDA concludes that use of the simplified format should be at the manufacturer's discretion, whenever a food product meets the criteria of containing insignificant amounts of half of the required nutrients. Accordingly, FDA has modified § 101.9(f)(1) by changing the word "shall" to "may."

173. A comment from a consumer group suggested that FDA require a different base than one-half of all 15 required nutrients for determining if a product qualifies for the simplified format because using all 15 nutrients results in "double-dipping." The comment suggested that calories from

fat should not be included because total fat represents the same nutrient, and that total carbohydrate should also not be included because complex carbohydrate and sugars comprise total carbohydrate. The comment stated that this procedure would result in a base of 13 different nutrients, of which seven must be present in insignificant amounts to qualify to use the simplified format.

FDA agrees that counting both "total fat" and "calories from fat" for the purpose of determining whether a food qualifies for use of the simplified format results in a double count being given to the fat content of a product. The agency, therefore, has deleted calories from fat from the qualifying criteria. However, in the case of "total carbohydrate," the agency notes that § 101.9(c)(6) is revised to delete "complex carbohydrate" as an element of nutrition labeling. Although "other carbohydrate" replaced "complex carbohydrate," the declaration of "other carbohydrate" is not mandatory. Therefore, the required subcomponents in § 101.9(f) no longer comprise the total amount of the component "total carbohydrate." Accordingly, "total carbohydrate" must continue to be included among the nutrients used as a base for determining whether a food qualifies for use of the simplified format.

The deletion of "calories from fat" and "complex carbohydrate" results in a base of only 13 nutrients. According to section 403(q)(5)(C) of the act, the simplified format is to be allowed if a food contains insignificant amounts of "more than one-half the nutrients required * * *." Therefore, it follows that the simplified format may be used when a food contains insignificant amounts of seven or more of the base nutrients.

As a result, and in accordance with the reordering of nutrients in § 101.9(c), FDA has modified § 101.9(f) to state that the nutrition information may be presented in a simplified format "when a food product contains insignificant amounts of seven or more of the following: Calories, total fat, saturated fat, cholesterol, sodium, total carbohydrate, dietary fiber, sugars, protein, vitamin A, vitamin C, calcium, and iron."

Although FDA has deleted "calories from fat" from the list of nutrients in § 101.9(f) used to determine when a product may use the simplified format, "calories from fat" continues to be a nutrient that must be declared under section 403(a) of the act in nutrition labeling when present in more than insignificant amounts. Therefore, FDA has modified § 101.9(f)(3)(ii), redesignated as § 101.9(f)(2)(ii), to require declaration of calories from fat in addition to any other nutrients identified in § 101.9(f) that are present in more than insignificant amounts. For the same reason, the agency has modified § 101.9(f)(4) to require calories from fat to be included in the statement "not a significant source of _____" if it is present in insignificant amounts.

174. One comment requested that FDA confirm that eligibility for use of the simplified format is not limited to those foods listed in the supplementary proposal as examples of foods that would use the simplified format (56 FR 60421 at 60474), but that the use of a simplified format is determined on a product-by-product basis.

FDA advises that the interpretation in the comment is correct. The determination that a food qualifies for the simplified format is dependent on the amount of nutrients in that food.

175. Some industry comments requested that FDA provide guidance on how the simplified format applies to foods for children under two years of age as these products are exempted by proposed § 101.9(j)(4) from labeling of calories from fat, saturated fat, and cholesterol, all of which are included in the list in proposed § 101.9(f)(1) of the 15 "required nutrients." Comments questioned whether the stipulation of insignificant amounts of eight or more required nutrients for the simplified format applies to such foods and if it does apply, whether calories from fat, saturated fat, and cholesterol are included in the eight insignificant nutrients, even though they are not required to be labeled.

In developing the proposed rules, FDA did not consider the application of regulations governing the use of the simplified format to foods for children less than 2 years of age. Since these foods have a required base of only 11 nutrients (i.e., calories, total fat, sodium, total carbohydrate, dietary fiber, sugars, protein, vitamin A, vitamin C, calcium, and iron), it is appropriate that they be allowed to use a simplified format when more than one-half (i.e., 6) of these 11 nutrients are present in insignificant amounts. Section 101.9(f) has been modified to include this provision for foods for children less than 2 years of age.

3. Definition of "insignificant amount"

176. A few comments recommended changes in FDA's proposed definition of "insignificant amount" of a nutrient as that amount that allows a declaration of zero in nutrition labeling. The term "insignificant amount" was used in section 403(q)(5)(C) of the act in reference to when a food would be exempt from nutrition labeling (proposed § 101.9(a)) and to when a food would qualify for the simplified format (proposed § 101.9(f)(1)). Comments on both uses of the term are discussed in this section to ensure consistent use of the term.

A few comments stated that the use of a mathematical base for determining "insignificant amounts" does not consider the actual need for the nutrients in the maintenance of good health, and that because FDA proposed to define "source" as from 10 to 19 percent of the RDI or DRV, anything less than 10 percent should be "insignificant." Other comments recommended the level of insignificance be changed to 0.5, 2, 5, or 8 percent of the RDI or DRV for particular nutrients. Another comment noted that defining "insignificant amount" as an amount less than 0.5 g of carbohydrate and protein is in conflict with the definition of "insignificant amount" for calories as less than 5 calories, given that 1 g of carbohydrate and protein furnishes only 4 calories. A comment also stated that, as a practical matter, consumers cannot reasonably be expected to differentiate between 0.5 g amounts.

FDA did take maintenance of health into consideration when it based its proposed definition of "insignificant amount" for calories (including calories from fat), total fat, cholesterol, sugars, and sodium on the amount defined as "free" under the proposed nutrient content claims rule (see final rule entitled "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms" published elsewhere in this issue of the **Federal Register**). (In addition, in the final rule on nutrient content claims, FDA defined "saturated fat free" as less than 0.5 g of saturated fat per serving.) For most nutrients, FDA has determined the level that is dietetically trivial or physiologically inconsequential (56 FR 60421 at 60433) and has established those levels as the "free" levels. Therefore, for those nutrients for which a level of "free" has been defined, FDA is denying the request to change the definition of "insignificant amount."

For those macronutrients that are required to be included in nutrition labeling but that do not have definitions of "free" levels (i.e., total carbohydrate, dietary fiber, and protein), FDA has reconsidered the proposed amounts and, in accordance with the comments, it is specifying in § 101.9 (f)(1) and (j)(4) that an insignificant amount of these nutrients is "an amount that allows a declaration of less than 1 g." Because 1 g of each of these food components

yields 4 calories, this amount is closer to the amount that will yield an "insignificant" amount of calories. By doing this, differentiation of amounts of 0.5 g will no longer be necessary.

In the case of vitamins and minerals, which also do not have definitions of "free" levels, FDA is not persuaded that amounts less than the amount defined as a source of a nutrient (i.e., less than 10 percent of the RDI) in § 101.54(c)(1) in the document on nutrient content claims published elsewhere in this issue of the Federal Register can be considered "insignificant." In fact, assuming that as many as 20 foods are consumed in a day (Ref. 109), levels of 5 percent or more of the RDI per food would be sufficient to assure that a person's daily requirements were met. Therefore, FDA rejects the suggestions that amounts greater than 2 percent but less than 10 percent of the RDI be considered insignificant.

177. One comment expressed concern about a potential compliance problem with § 101.9(f)(1) for firms who elect to "round down" Class II nutrients under § 101.9(g)(4)(ii) and to "round up" calories, sugars, total fat, saturated fat, cholesterol, or sodium under § 101.9(g)(5). The comment stated that by defining "insignificant" based on analytical capabilities while at the same time requiring that the simplified format be used, a firm could find itself in violation of § 101.9(f)(1) by either claiming that it is required to use the simplified format, or by asserting that it must use the complete nutrition format.

FDA does not believe its proposed definition of "insignificant" has any bearing on this concern because the concern could exist at any defined level. However, the amendment of § 101.9(f)(1) discussed above, whereby the simplified format is allowed, not required, on foods that meet the qualifying criteria, resolves the comment's concerns for Class II nutrients. For other nutrients, FDA advises that firms should determine label values to be in compliance with § 101.9(g) and then determine, based on those values, whether or not a food qualifies to use the simplified format.

4. Nutrients To Be Declared

178. While most comments supported the required declaration of "core" nutrients (i.e., calories, total fat, total carbohydrate, protein, and sodium) in the simplified format, a few comments requested that the proposed mandatory declaration of the "core" nutrients be deleted. Comments from firms manufacturing honey, chewing gum, and spices requested that FDA adopt a more simplified format for foods that have very limited nutritional value. These comments requested that only those nutrients that are present at more than insignificant levels be required to be declared. For example, chewing gum would declare only calories and carbohydrates, and seasoned salt only sodium.

FDA is not persuaded that it should drop the requirement for declaration of the core nutrients. This core information is essential to aid consumers in learning about the relative nutritional qualities of all foods, and it allows them to judge the consequences of the food selections they make. Most comments supported this position. Also, as discussed above in this section on format, consistency in presentation is a principle that has guided the agency in developing the new format because such consistency has been shown to help consumers. Therefore, FDA is not making the requested change.

179. A few comments from the soft drink industry expressed opposition to mandatory listing of sugars in the simplified format stating that it is not consistent with the intent of the law which is to enhance consumers' understanding of sound dietary practices. The comments contended that mandatory declaration of sugars places undue emphasis on a nutrient that does not warrant such emphasis in light of its physiological impact. One comment explained that the greatest concern posed by sugars is their potential carcinogenicity which, considering the rapid passage of soft drinks through the mouth, is significantly lower than other sugar-containing foods.

A comment from the honey industry also objected to required declaration of sugars on honey products on the basis that it "could mislead consumers into thinking that the honey had been manufactured from what consumers most likely regard as 'sugar'—table sugar."

As discussed in section III.F.3. of this document, the agency has concluded that the mandatory declaration of sugars content in nutrition labeling is consistent with the law. In regard to the simplified format, the 1990 amendments and its legislative history give no direction on the content of the simplified label, only that it be "in a simplified form prescribed by the Secretary." Based on the criteria Congress put on the use of the simplified format, it is possible to infer that its purpose is not to save space on the label nor to allow the declaration of otherwise mandatory nutrients to be omitted, but rather to modify the label by allowing nutrients not present in significant amounts to be omitted. FDA does not believe that the legislation allows it, or that there is any reason, to permit a nutrient that is required to be declared in complete nutrition labeling to be omitted from the simplified format when that nutrient is present in more than insignificant amounts.

In response to the comments from the honey industry, FDA acknowledges that consumers must be made aware of the different purposes of the ingredient statement and the nutrition label and be taught how to use the information in each. Developing this awareness will be a component of the consumer education program discussed in section IX. of this document.

The comment presented no data to show that consumers will be misled by a declaration of sugars in the nutrition label. As discussed in section III.F.3. of this document, FDA believes that sugars should be a mandatory component of nutrition labeling because it will assist consumers in planning diets that conform to current dietary guidelines and is of great interest to consumers. Therefore, FDA finds no basis not to require that sugars be treated in the nutrition label of honey as they would be in the nutrition label of any other product that is a natural source of sugars, such as fruits.

5. Use of statement "Not a Significant Source of"

A number of comments were received that addressed the requirement in § 101.9(f)(4) that the simplified format include the statement "Not a significant source of _____," with the blank filled in with the name of the missing nutrient, when additional nutrients are voluntarily added to the food or declared in the simplified format.

180. Many comments on this subject supported the proposal. However, a few comments from consumers, health professional associations, and industry suggested that all simplified labels should include a statement identifying those nutrients present in insignificant amounts, such as "Not a significant source of _____." One comment stated that consumers may be misled by the missing information unless the nutrients that are not present are identified. Two other statements that were suggested were: "This product does not provide you with any _____" where the blank is filled in with the names of nutrients present in insignificant amounts, or a statement that informs consumers that "This food contains less than ½ of the nutrients required for full nutrition labeling."

FDA is not persuaded that consumers will be confused by the absence of certain nutrients on simplified labels.

Most of the foods that will be able to use this format are basic commodities or simple foods (e.g., oil, butter, sugar, syrups, juices, drinks) for which it is reasonable to expect that consumers will know that the missing nutrients are not present in the food. Therefore, in response to the Congressional intent that the label be "simplified," the agency is not making the suggested change.

181. Other industry comments generally opposed requiring such a statement when additional nutrients are voluntarily added to the food or declared in the simplified format on the grounds that it clutters the label with a long list of nutrients that are not present. One comment stated such a requirement is discriminatory, especially if the additional nutrient is declared because of a nutrient content claim. Another comment suggested that simplified labels that declare naturally occurring nutrients be treated differently from those that declare added nutrients. Several comments suggested that the statement "Not a significant source of other nutrients" be used in lieu of the proposed statement as this would provide consumers information without cluttering the label.

FDA disagrees with the comments. When nutrients are voluntarily added to a food or voluntarily declared in the nutrition label, or when a nutrient content claim is made on the label, the food is being marketed as a significant source of nutrients. In such cases, the food label would be in violation of section 201(n) of the act unless consumers are advised about the full nutritional profile of the food.

FDA shares the concern about the space required by the list of nutrients not present. However, the statement "Not a significant source of other nutrients" is too broad and therefore could be misleading on a large proportion of foods. Even though the food may not contain significant amounts of the nutrients required in § 101.9(c), it may contain significant amounts of other essential nutrients that are not required to be declared in nutrition labeling. The language suggested by the comment, however, asserts that the food is not a source of any other nutrients. Thus, to determine whether such a statement is true, it would be necessary to analyze for all known essential nutrients. The agency believes that such a situation makes no sense and therefore is not making the suggested change.

182. One industry comment opposed the exemption of standardized enriched foods from the required statement "Not a significant source of _____," stating that there is no basis for treating different food products (i.e., nonstandardized enriched foods) discriminatorily. Another comment wanted FDA to state that the addition of a nutrient such as vitamin C to a food, if required by a standard of identity or another government standard (i.e., a purchase specification to qualify for use in the Special Supplemental Food Program for Women, Infants, and Children (WIC)) would not require the statement "Not a significant source of _____."

FDA is persuaded that foods containing added vitamins and minerals, whether under a food standard or not and whether required by purchase specifications or not, should be treated similarly. Therefore, FDA has modified proposed § 101.9(f)(4) to require that if any vitamins or minerals are declared as part of the simplified format for any reason, the statement "not a significant source of _____" shall be included at the bottom of the nutrition label. This statement is also required if any additional naturally occurring nutrients are voluntarily declared in the simplified format. To clarify the regulation, the requirement that any added vitamins and minerals must be declared as part of the simplified format is removed from proposed § 101.9(f)(4) to become new § 101.9(f)(2)(iv). Additionally, § 101.9(f)(4) is subdivided into § 101.9 (f)(3) and (f)(4).

6. Format for the Simplified Label

183. Many comments from industry responding to the supplementary proposal were opposed to requiring the DRV list in the simplified format, arguing that such a required list would considerably expand the simplified format and therefore defeat its purpose.

A few comments responding to the format proposal argued that examples of simplified formats illustrated at appendix D of the proposed rule were merely abbreviated versions of the nutrition label format and not simplified formats as called for by the 1990 amendments. These comments were particularly critical of the inclusion of the listing of DRV's in the simplified format because they argued that an abbreviated list of DRV's would communicate incomplete, and therefore misleading, information about a total daily diet. Other comments supported the examples of simplified formats in the proposed rule on the grounds that they eliminated unnecessary information but retained a consistent appearance with the regular format.

FDA agrees that an important consideration for the simplified format is that it retain common elements with the regular format to facilitate consumer understanding and use of the nutrition information. FDA does not agree that section 403(q)(5)(C) of the act requires a simplified format that is simpler in other respects than being an abbreviated version of the regular format. As discussed in comment 179 of this document, the 1990 amendments and their legislative history give no direction on the content of the simplified format. However, FDA agrees with the concern expressed about the value of an abbreviated list of DRV's. After careful consideration of the comments, the agency is convinced that by declaring quantitative amounts as percent of Daily Values, the simplified format will retain sufficient common elements with the regular format to facilitate consumer use and comprehension. The agency is also convinced that not requiring the full footnote and calorie conversion information required in § 101.9 (d)(8) and (d)(9) on the simplified format will not sacrifice important objectives of the legislation because the information is not specific to the particular food and is available on a significant portion of the food supply. Therefore, FDA is requiring in § 101.9(f)(5) that a simplified format contain only quantitative and Percent of Daily Value information in the same format as required for full or dual nutrition labeling in § 101.9 (d) and (e), respectively.

184. Comments to the format proposal addressing the use of the simplified PERCENT DV formats generally preferred the use of columns rather than the in-line presentation. Comments stated that the in-line presentations appear significantly more difficult to use and make it difficult to distinguish the actual quantitative amounts from the DRV's. One comment was received from a consumer interest group opposing the line concept on the grounds that it is difficult to read, confusing, and will allow a company to hide the content of fat, sodium, or other undesirable nutrients in the product. The comment maintained that if a line format is allowed, it should only be permitted when no additional voluntary disclosures are made. The comment stated that such additions would make the nutrition information comparable in length to the required format, and FDA has already determined that the required format would not be legible in a line format. However, several industry comments were received in support of allowing the abbreviated nutrition information to be presented in either vertical columns or lines because of the

flexibility and saving in space provided in this option.

FDA agrees that, where label space is adequate, the simplified label is best understood when the information is presented in columns, particularly when additional nutrients are voluntarily disclosed. However, as discussed in section VI.K. of this document, the agency is aware that special allowances are necessary on labels of small or intermediate sized packages. Therefore, in § 101.9(f)(5) the agency is requiring that nutrition labels on products qualifying for the simplified format present the required information in the same format as is required in § 101.9 (d) and (e) for other packaged foods, except that foods in small and intermediate sized packages that come under § 101.9(j)(13) are allowed by that section to present the information in a linear fashion. Examples of simplified formats are seen in appendix F.

185. One industry comment said that while it supported the simplified nutrition label format for sugar, this format, as depicted in the proposal, may be confusing on labels of soft drinks because consumers may conclude that the soft drink has 36 g carbohydrate and 36 g sugars. If sugars are required to be listed, the format should provide for indentation that would clarify that sugars are a subcategory of total carbohydrates.

FDA agrees that the format must allow for subcomponents to be indented under the primary component. Accordingly, § 101.9(c)(6)(ii) specifies that sugars are to be indented under total carbohydrate. A similar requirement is specified for each subcomponent. In addition, § 101.9(d)(1)(iv) requires the primary component to be highlighted to further differentiate it from its subcomponents.

VI. Exemptions and Special Conditions

A. Small Business

The 1990 amendments granted an exemption from mandatory nutrition labeling for small businesses. Under section 403(q)(5)(D) of the act, a small business is defined as a business with less than $500,000 annual gross sales of food or any commodity, or a business with annual gross sales of more than $500,000 but less than $50,000 in food sales. The exemption does not apply to those products that make nutrition claims or provide nutrition information.

186. Many comments from industry, trade associations, and international organizations have stressed that the dollar exemption limits in proposed § 101.9(j)(1) that implement the 1990 amendments are too low. The comments note that the sum of analytical, printing, and other costs of nutrition labeling are prohibitively expensive for low volume products. Many small food producers that exceed the $500,000/$50,000 sales limit report that they will suffer a severe economic hardship if forced to comply with the nutrition labeling rules. One comment stated that without an increased exemption, 25 percent of food businesses in Kansas would close. Retail bakery and confectionery trade groups stated that the nature of their business dictates that they offer hundreds of different products throughout the year, and that limiting and standardizing product lines would cause a retail operation to lose its character and appeal. Yet, the need to nutrition label products would force such standardization. Other consequences for small businesses that would not qualify for the exemption that were identified in the comments included the loss of a substantial portion of annual profits, loss of low volume product lines, and small business failure.

FDA has considered these comments and believes that there is merit in many of the contentions they raise. To gain adequate information on what to recommend as a reasonable and appropriate adjustment to the 1990 amendments' standard, FDA participated in a series of public forums that had been scheduled by USDA to discuss the small business issue. These forums were held in May, 1992, in Kansas City, MO; Atlanta, GA; and San Francisco, CA. In a notice of the public forums (57 FR 19410, May 6, 1992), FDA announced its participation in the forums and requested comment on a number of issues, such as which option should be used to amend the current statutory exemption—increasing the gross annual sales exemption, providing an exemption based on the number of units sold of a particular product line, basing the exemption on the number of employees, or any combination of such options. Comments were also requested on the feasibility of compliance with various limits and the effect on the percent of the diet bearing nutrition labeling.

The agency has compiled the information it received. However, at the current time the agency is constrained by the requirements of section 403(q)(5)(D) of the act. Therefore, § 101.9(j)(1)(i) has not been changed. If Congress amends the statute, FDA will implement the change as soon as possible thereafter.

187. Comments have questioned FDA's interpretation of that part of section 403(q)(5)(D) of the act that states "If a person offers food for sale * * * or has business done in sales to consumers" to mean that foods produced by small businesses that are exempt would have to bear nutrition labeling if they were sold by a larger retailer who was not exempt. The comments stated that this interpretation would have a devastating impact on many small entrepreneurs who primarily sell their products through larger retailers or department stores.

In § 101.9(j)(1)(ii), FDA proposed that this exemption applied to any "person who manufactures, packs, or distributes food for ultimate sale to consumers at the retail level as well as any person directly involved in the retail sale of foods to consumers." The legislative history was not specific as to whether the term "retailer" applied only to the small business retailer/producer or to a larger retailer acting as a middle-man in handling the sale of the items to the ultimate consumer (Ref. 16). The agency is convinced by the comments that its interpretation would have unintended consequences on small businesses and, therefore, is removing "as well as any person directly involved in the retail sale of foods to consumers" from § 101.9(j)(1)(ii). To further clarify which foods are covered by the small business exemption and to streamline the regulations, FDA is also deleting the remaining portion of § 101.9(j)(1)(ii) and revising § 101.9(j)(1)(i) to state that "Food offered for sale by a manufacturer, packer, or distributor who has annual gross sales made or business done in sales to consumers that is not more than * * *." The agency's intent with this change is that the exemption will apply to persons whose name appears on the label as the manufacturer, packer, or distributor of the product, regardless of who ultimately sells the product to the consumer. As a consequence, § 101.9(j)(1)(iii) is redesignated as § 101.9(j)(1)(ii).

B. Ready-to-Eat Foods

188. Comments stated that proposed § 101.9 (j)(2) and (j)(3) did not adequately track section 403(q)(5)(A)(i) and (q)(5)(A)(ii) of the act, which both pertain to foods ready for consumption but differ in that section 403(q)(5)(A)(i) of the act addresses foods served for immediate human consumption and section 403(q)(5)(A)(ii) addresses similar types of foods that are sold ready for human consumption but not for immediate human consumption and that are processed and prepared primarily on the premises.

The agency is persuaded that proposed § 101.9 (j)(2) and (j)(3) in its supplementary mandatory nutrition

labeling proposal (56 FR 60366) (which were based on proposed § 101.9 (h)(2) and (h)(3) in FDA's July 19, 1990, mandatory nutrition labeling proposal) did not adequately implement the 1990 amendments. FDA is therefore revising these two sections as discussed below in accordance with the 1990 amendments and in response to comments.

1. Foods for Immediate Human Consumption

In proposed § 101.9(j)(2) of its supplementary proposal (56 FR 60366), FDA proposed to exempt "food products provided by restaurants or other food service facilities offering restaurant-type services (e.g., delicatessens, bakeries, feeding facilities in organizations such as schools, colleges, hospitals, and transportation carriers (such as trains and airplanes))." While this list was not all-inclusive, it was intended to respond to section 403(q)(5)(A)(i) of the act which directed the agency to exempt food "which is served in restaurants or other establishments in which food is served for immediate human consumption * * *." Examples of congressional intent concerning the types of facilities covered by section 403(q)(5)(A)(i) of the act are limited in the legislative history to cafeterias and hospitals (Ref. 16).

189. While many comments supported the exemption in § 101.9(j)(2) for restaurants, several comments requested clarification about the coverage of the proposed section. For example, comments asked whether it covers retail confectioners, ready-to-eat food carryouts, vending machines, and food delivery systems such as meals-on-wheels programs or establishments such as pizza-delivery companies. Comments also pointed out the great diversity in the types of establishments in which food is served for immediate human consumption in the United States. For instance, comments stated that in addition to full-service restaurants, many establishments such as delicatessens, bakeries, candy stores, and convenience stores provide customers with tables and chairs to sit and immediately consume foods purchased. Others, whether for lack of space or for other reasons, do not provide such facilities. For example, frequently food franchises in shopping malls sell cookies or other snack foods expecting customers to eat the foods while walking in the mall or while sitting on benches located throughout the mall.

Comments from a company producing sandwich and salad items in a commissary for sale in vending machines requested to be included under this exemption because the subject foods are sold for immediate consumption, not for "take-home" use, and because the foods are prepared in a commissary kitchen similar to a restaurant/cafeteria kitchen, where foods are assembled by hand and subject to individual product variations. The comment argued that mandatory nutrition labeling would require standardization of menu items, thereby prohibiting common day-to-day variations in the food items produced, and would require larger labels or smaller type-size, both of which would be difficult or impossible to read through the small glass door of a refrigerated vending machine.

Similarly, one comment pointed out that some foods sold in convenience stores are intended for immediate human consumption and compete directly with foods served by restaurants and delicatessens. It stated that many stores have seating areas for customers to use while eating foods purchased on-site, and that in some states, such convenience stores must have restaurant licenses. Foods sold range from self-service beverages to prewrapped sandwiches, prepared off-site by vendors and offered for sale in store display cases.

FDA notes that section 403(q)(5)(A)(i) of the act addresses restaurants and "other establishments in which food is served for immediate human consumption." To respond to the comments stating the proposed rules did not adequately track the 1990 amendments, the agency is revising proposed § 101.9(j)(2) to include a new paragraph (ii) that states that the exemption is to include food products served in "other establishments in which food is served for immediate human consumption." In addition, in response to comments seeking clarification of the coverage of such "other establishments," and in recognition of the diversity of food service operations in the United States, the agency advises that while some enforcement decisions will need to be made on a case-by-case basis, for efficient enforcement of the act, it is providing in § 101.9(j)(2)(ii) that, in addition to food service in hospitals and cafeterias, the agency considers that this exemption applies to establishments such as bakeries, delicatessens, and retail confectionery stores where there are facilities for "immediate consumption" on the premises (i.e., tables or counters with chairs); to food service vendors such as lunch wagons, mall cookie counters, vending machines, and sidewalk carts where foods are generally consumed immediately where purchased or while walking away (including similar foods sold from convenience stores); and to food delivery systems or establishments where ready-to-eat foods are delivered to homes or offices for immediate consumption.

FDA recognizes that some persons might consider that it is inconsistent for the agency to exempt packaged foods sold in vending machines from nutrition labeling but not from ingredient labeling. However, the agency is convinced that such foods are exempted from nutrition labeling by section 403(q)(5)(A)(i) of the act because vending machines serve food for immediate consumption, and there is no similar statutory exemption from ingredient labeling.

Regarding convenience stores, FDA agrees that some foods sold in such stores bear many similarities to foods sold at restaurants and delicatessens and should qualify for similar exemptions. Because circumstances will vary greatly according to the services a particular convenience store offers, it is not possible to state precisely which foods do or do not have to provide nutrition labeling. Rather, determinations will have to be made on a case-by-case basis. However, § 101.9(j)(2) generally provides an exemption for foods of the type served in restaurants or other establishments in which food is served for immediate human consumption. Such foods might include beverages (both self-service and those served by store personnel), frankfurters in a roll, cold sandwiches, pizzas, and hand-packed ice cream cones.

190. Many comments requested that proposed § 101.9(j)(2) be amended to clearly exempt foods "sold for sale or use" in restaurants or other establishments in which food is served for immediate human consumption as specified in section 403(q)(5)(A)(i) of the act. They argued that the statutory language indicates that food intended for use in restaurants is exempt from mandatory nutrition labeling in the absence of nutrient content or health claims. The comments pointed out that proposed § 101.9(j)(2) merely provided an exemption for foods provided by restaurants and did not cover foods intended for sale or use in restaurants.

The agency agrees that the proposed regulations did not fully implement section 403(q)(5)(A)(i) of the act that covers foods sold for sale or use in restaurants or other such establishments. As directed in the statute, this exemption applies to all foods sold in restaurants, including packaged products such as a specialty

house dressings made by the restaurant, or used in restaurants, such as portion controlled packages (e.g., individual catsup or coffee whitener packages) for use only in restaurants. If a manufacturer makes a product for sale only in restaurants (e.g., a package of candy), that product need not be nutrition labeled. However, if there is a reasonable possibility that the product will be purchased directly by consumers in a setting other than a restaurant or other establishment in which it is served for immediate consumption, it must be nutrition labeled (see Ref. 25). Accordingly, FDA has modified proposed § 101.9(j)(2) to add a new paragraph (iii) that exempts foods sold for sale or use only in restaurants or other establishments in which food is served for immediate human consumption.

191. A few comments requested that the second sentence of proposed § 101.9(j)(2) be revised to adequately implement section 403(q)(5)(F) of the act that exempts food "which is sold by a food distributor if the food distributor principally sells food to restaurants or other establishments in which food is served for immediate human consumption and does not manufacture, process, or repackage the food it sells." The comments pointed out that the second sentence in proposed § 101.9(j)(2) would only exempt "foods sold to restaurants by distributors * * *" which is duplicative of that part of 403(q)(5)(A)(i) of the act that stipulates an exemption for foods sold for sale or use in restaurants and fails to include the broader exemption in 403(q)(5)(F) of the act for all foods sold by distributors who principally sell food to restaurants or other establishments in which food is served for immediate human consumption and who do not manufacture, process, or repackage the food they sell.

The agency is persuaded that there is a need to revise the second sentence of proposed § 101.9(j)(2). As discussed in the legislative history (Ref. 25), the food distributor that sells principally to restaurants and other food service establishments is exempted from mandatory nutrition labeling requirements as long as the food distributor does not manufacture the product sold to the consumer. However, the legislative history states:

> The manufacturer of such products would be responsible for providing the nutrition information on the products if there is a reasonable possibility that the product will be purchased directly by consumers, even if the principal customers are restaurants and other wholesale purchasers. * * * [T]he distributor is not liable as long as the distributor does not manufacture the product sold to the consumer.
> (Ref. 25)

In essence, this legislative history makes clear that section 403(q)(5)(F) of the act is intended to direct the agency to do for foods sold to restaurants what it does for foods sold to consumers; that is, to hold the manufacturer, not the seller, responsible for nutrition labeling of foods. (The only exception to this approach is the voluntary nutrition labeling program for raw fruits, vegetables, and fish in which the retailer is to provide the nutrition information.) This exemption would apply to an independent distributor who principally distributes institutional foods directly to restaurants and similar establishments and does not manufacture, process, or repackage the food it sells.

Thus, under this exemption, such a distributor is not responsible for nutrition labeling a product, even if it sells the product in a so-called "cash and carry" store, unless it manufactures, processes, or repackages the food for sale to consumers. On the other hand, a manufacturer of institutional size food products is responsible for nutritionally labeling those products if there is a reasonable possibility that they will be sold to consumers, for example, through such a mechanism as a cash and carry store.

Therefore, proposed § 101.9(j)(2) is modified by adding § 101.9(j)(2)(iv) to fully implement this exemption.

192. One comment recommended that statements such as "for food service use" or "not labeled for retail sale" be used as one means of qualifying for the exemption or that such foods be identified by the size of the package. The comment suggested that such a rule would be of particular help for foods imported for the food service trade.

The legislative history quoted in the preceding comment makes clear that nutrition labeling is required "if there is a reasonable possibility that the product will be purchased directly by consumers * * *." Therefore, the agency does not believe that a label statement can be used as the basis for this exemption. The agency is concerned that, if permitted, a label statement such as "for food-service use" would be used to claim exemption for products that Congress intended to be nutrition labeled. Therefore, rather than create the possibility for potentially misleading labeling, FDA is denying this request.

Imported foods that are in large packages that are obviously not intended or packaged for sale to consumers would be considered exempt under § 101.9(j)(9) which deals with foods shipped in bulk form that are to be processed, labeled, or repacked at a subsequent site.

193. Several comments opposed proposed § 101.9(j)(2) because it would exempt restaurants from mandatory nutrition labeling. These comments urged that restaurants, particularly the regional and national chain restaurants, be required to have nutrition information available to consumers. Some comments suggested that the required information could be: (1) limited to calories, fat, saturated fat, cholesterol, and sodium; (2) based on computer analysis of nutrient databases; and (3) presented in alternative ways such as brochures, menu boards, posters, or tray liners. A few large fast food restaurant chains requested guidelines for voluntary nutrition labeling with flexibility in format and content. They requested that restaurants be allowed to use their own serving sizes, present information on an as-served basis, and update information annually.

In response to comments requesting that restaurants be required to provide nutrition information, the agency points out that section 403(q)(5)(A)(i) of the act specifically exempts restaurants and other establishments in which food is served for immediate human consumption from mandatory nutrition labeling, unless a nutrient content claim or a health claim is made. The requirements that pertain when claims are made are discussed extensively in the final rules on the general requirements for nutrient content claims and health claims that are published elsewhere in this issue of the **Federal Register**.

FDA is aware, however, of the consumer interest in knowing the nutrient content of foods eaten away from home. In response to that interest and to the comments from fast food chains, the agency intends to work closely with all interested parties, particularly those in the food-service sector, to develop guidelines for presenting nutrition content information in a restaurant setting in such a way that it will not inhibit the flow of useful nutrition information (e.g., claims) to the consumer, while at the same time providing assurance of the reasonable accuracy of the information, thus furthering the goal of the 1990 amendments to aid consumers in maintaining healthy dietary practices.

194. One comment agreed that the 1990 amendments exempt restaurants from mandatory nutrition labeling but requested that they be regulated under sections 201 and 403(a) of the act. The comment also requested that FDA clarify that the 1990 amendments have

no preemptive effect on state or local regulation of the nutritional disclosures by restaurants.

FDA advises that the exemptions in § 101.9(j) in no way exempt any foods from regulations promulgated under sections 201 and 403(a) of the act. In regard to State and local preemption, the legislative history states that "Because food sold in restaurants is exempt from the nutrition labeling requirements of section 403(q)(1) through (q)(4) of the act, the bill does not preempt any State nutrition labeling requirements for restaurants. If States do require such labeling in restaurants, it is important that they make every effort to make those requirements consistent with the requirements of the bill." (Ref. 110).

2. *Foods Not for Immediate Consumption.* 195. Many comments objected to proposed § 101.9(j)(3) that allowed an exemption for in-store delicatessen and bakery foods only when they were sold from behind service counters. Comments pointed out that the 1990 amendments made no distinction for such foods when sold from behind the counter rather than from a self-service display. They stated that such a rule would be totally unworkable and would adversely affect the bakery and deli departments. Such a rule, according to the comments, would make it impossible to sell foods that are sold from behind the service counter during the day, at night, when no service clerks are available, or to assemble sandwiches and salads for fast pickup during the lunch hour from self-service counters, without nutrition labeling those foods. A trade association reported that 21 percent of in-store bakeries' sales come from bulk self-service units and 42 percent from prepackaged self-service cases, and that, if compelled to standardize and label their products, such bakeries would be unable to continue in competition with wholesale bakery items.

The comments argued that in-store delicatessens and bakeries should be able to adhere to the same regulations as their independent counterparts, with whom they compete for business. They stated that in-store delicatessens and bakeries operate as independent bakeries in that their accountability is separate from the rest of the store.

Other comments stated that the intent of Congress was that foods similar to restaurant foods that are ready for immediate consumption, and that are produced by retailers that offer variable and nonstandardized products, should be exempt from nutrition labeling to eliminate the substantial burdens that would otherwise be imposed if such labeling were mandatory. Many comments have pointed out that the average baker or confectioner produces hundreds of different products each year, and that the average sales per product are relatively low. Comments stated that the precise selection of foods produced is frequently modified according to changing preferences of customers, seasons, holidays, ingredient availability, and the individuality of the baker/confectioner. Comments argued that it is this ability of the retailer to vary and customize food products that gives the establishment its character and appeal, and that forced standardization to allow for nutrition labeling would eliminate product competitiveness by disallowing innovation and creativity. This loss of competitiveness, in turn, would create a major economic burden and thereby lessen consumer choice.

The agency is persuaded that proposed § 101.9(j)(3) did not adequately implement section 403(q)(5)(A)(ii) of the act, could result in economic harm to in-store delicatessens and bakeries, and created an artificial demarcation between foods sold from service versus self-service areas of the delicatessen or bakery. Therefore, FDA believes that it is necessary to revise § 101.9(j)(3) to more closely reflect the language of the act.

As stated above, section 403(q)(5)(A)(ii) of the act applies to foods that are: (1) Similar to the type addressed in section 403(q)(5)(A)(i) of the act, (2) ready for human consumption, and (3) offered for sale to consumers but not for immediate human consumption. Accordingly, FDA is modifying § 101.9(j)(3) by adding paragraphs (i) through (iii) to reflect these three statutory requirements. There were no specific concerns presented in comments that suggest any problems with these requirements.

Section 403(q)(5)(A)(ii) of the act also requires that the foods to which it applies be processed and prepared primarily in the retail establishment. The agency is codifying this requirement in § 101.9(j)(3)(iv). Comments were very divided on this issue, particularly for bakery items. Some comments argued that breads shipped to a retail store in a semi-finished condition and baked-off just before retail sale would not meet the criteria of "prepared and processed primarily" at the retail store and should not be exempt. However, other comments disagreed with this position, stating that frozen dough products are further processed at the bakery by being proofed, shaped, molded, filled, decorated, cut, assembled, customized, or otherwise completed or further processed and should be exempt.

The legislative history discusses this situation stating that for bakeries "simply thawing frozen bread would not be sufficient; the bread would have to be baked on the premise" (Ref. 16). While this statement appears to indicate that baking (i.e., cooking at a high temperature in an oven) is sufficient to qualify a food for this exemption, comments have argued that "baking" is not equivalent to heating but includes a number of steps, such as "selecting, weighing, and mixing ingredients, fermentation, and shaping and forming the dough prior to actual heating the product."

This example with bread illustrates the difficulty in applying the criterion of "processed and prepared primarily in a retail establishment." Because of the wide variety of foods sold in delicatessens, bakeries, retail confectionery stores, and other stores of this type that may not qualify for exemption under § 101.9(j)(2), it becomes administratively impossible to identify for each type of food sold the exact amount of processing or preparation that would be needed to say that that food was "processed and prepared primarily" on-site.

In many establishments, foods such as bakery items or salads, may be prepared entirely on-site; however, in other similar establishments, much less of the processing and preparation of these foods is actually done on the premises. Similar variations are encountered with other foods, such as cheeses, which may only need to be sliced and portioned, or puddings, which may be purchased in cans and only need to be put in trays in the display case for portioning. The characteristics that all of these foods have in common is that they are ready-to-eat, they are the same type of foods sold in restaurants, and they are portioned and packaged on-site.

Legislative guidance to assist the agency in defining what is meant by "processed and prepared primarily in a retail establishment" in addition to that cited above is scant. However during Senate debate, one of the sponsors of the bill that became the 1990 amendments stated that:

> This exemption recognizes that when food is processed and prepared primarily on the premises and sold there, as in the prepared food sections of supermarkets, nutrition labeling is not appropriate. On the other hand, if the preparation or processing of food is standardized and is accomplished primarily at another establishment and the same food is then shipped to a retail food store in a form that requires minimal or no further processing, nutrition labeling can be easily accomplished and is required.

(Ref. 110).

The agency interprets this legislative history to mean that if the food arrives at a store in a form to be sold directly to the consumer (i.e., it is "standardized"), then nutrition labeling must be required. However, if the food is not standardized, i.e., it has to undergo processing or preparation, including portioning, before being sold to the consumer, then nutrition labeling is inappropriate and should not be required. In the case of the examples cited above, FDA finds that nutrition labeling would therefore not be required on bread that is shaped; filled, decorated, assembled, or customized and baked (i.e., cooked at a high temperature) in the retail establishment. Cheese that is sliced and portioned according to directions given by the consumer, and pudding that is portioned according to directions given by the consumer, also need not be nutrition labeled. In these examples, the food is not "standardized" in the form that it is to be sold to consumers when it arrives at the store. Similarly, candies sold in retail confectionery stores that are selected by consumers to be part of a packaged assortment are not "standardized."

However, because of the great diversity of situations in which foods are sold, it must be recognized that a decision regarding exactly what foods do or do not require nutrition labeling cannot be fully resolved by regulation. Circumstances at the retail location must be the deciding factor.

196. A few comments from the retail baking and confectionery industries and from grocery stores requested that the exemption for single-unit bakeries, delicatessens, and confectioneries apply equally to multi-unit establishments that do most or all of their preparation at a central facility or shop. Each type of respondent attempted to limit such an exemption by describing what it would encompass. For example, a comment from the retail baking industry described multi-unit bakeries as being owned, controlled, and operated by the same entity and stated that finished products would be delivered unwrapped or in bulk delivery boxes to each store or outlet. The confectionery industry requested that the exemption cover satellite operations operated by the same businesses, selling the same products, and using the same packaging. A small retail grocery chain suggested limiting the exemption to foods prepared in central kitchens for use in the retailer's own stores. Reasons given for using central facilities included ensuring quality control through a controlled environment that promotes food safety and integrity and allowing for economies of scale. Comments stated that the average number of bakeries operated by a multi-unit retail bakery was 2.4 in 1988, and that many small independent confectioneries only operate one additional outlet.

FDA does not believe that the 1990 amendments allow for exemptions beyond those discussed in the preceding comments. This position is based on the final criterion given in section 403(q)(5)(A)(ii) of the act, which states that foods to which the section applies shall not be offered for sale outside the retail establishment in which they are primarily processed and prepared. The agency is codifying this requirement in § 101.9(j)(3)(v). While foods that are fully prepared and portioned (i.e., "standardized") at the central facility are required to bear nutrition labeling, there may be some types of food products or circumstances in which the portioning or packaging is not standardized, and in which nutrition labeling would consequently not be required (e.g., salads that are portioned and packaged according to directions given by the consumer).

FDA notes that the problems presented in most of the comments on this aspect of this exemption have more to do with the size of the businesses than whether there are good reasons not to require nutrition labeling. FDA believes that the best way to deal with most of these comments is through a change in the small business exemption.

C. Foods of No Nutritional Significance

To reflect the first sentence in section 403(q)(5)(C) of the act, FDA proposed an exemption for foods of no nutritional significance in § 101.9(a). It proposed to include the other exemptions in § 101.9(j). To minimize any confusion that these differences in placement may cause, the agency has decided to group all exemptions in one place in this final rule. Accordingly, that part of proposed § 101.9(a) that exempted foods of no nutritional significance is redesignated as § 101.9(j)(4).

197. Comments from the coffee industry noted that, unlike FDA's mandatory nutrition labeling proposal, the supplementary proposal did not explicitly identify coffee as being nutritionally insignificant. Thus, the comment requested clarification in the final rule. The comments pointed out that coffee is always consumed as a brew. An analogy was drawn to § 101.45(b)(4) in the guidelines for voluntary nutrition labeling of raw fruit, vegetables, and fish, which states that nutrition information is to be based on the edible portion of the food. Comments stated that the available nutrients in brewed or plain instant coffee would meet the criteria for being nutritionally insignificant.

The agency agrees that only the edible portion of coffee should be considered in determining the nutritional significance of the product. Therefore, based on a review of available nutritional data on a serving of coffee and on the revisions in the levels that are significant, discussed in comment 176 of this document, FDA has concluded that coffee beans, roasted ground coffee, or dry plain (i.e., unsweetened) instant coffees contain no nutrients at other than nutritionally insignificant levels. As a result, these foods are exempt from mandatory nutrition labeling. Unsweetened plain tea powders or tea leaves likewise would be exempt.

In response to comments requesting clarification of the exempt status of coffee and tea, FDA has included in § 101.9(j)(4) a listing of coffee beans (whole or ground), tea leaves, and unsweetened plain instant coffee and tea as examples of foods that are exempt from nutrition labeling because of their lack of nutrients. The agency reiterates, however, that this exemption is available only when there are no nutrient content or health claims on the label or in labeling or in advertising of the coffee or tea.

198. The spice industry commented that FDA did not establish a reference amount for spices, thereby implying that spices are exempt from mandatory nutrition labeling. Comments requested that the agency provide an explicit statement in the final rule regarding the exemption of spices, spice blends (e.g., curry powder), and condiment-type dehydrated vegetables (e.g., dried garlic) as well as flavor extracts and food colors, from the nutrition labeling requirements.

As discussed in the final rule on serving size published elsewhere in this issue of the **Federal Register**, FDA has set a reference amount of ⅛ teaspoon for most spices and condiment-type dehydrated vegetables. In reviewing the nutritional data in Agriculture Handbook No. 8–2 and 8–11 (Refs. 111 and 112), the agency has found that, under FDA's criteria for determining nutritional insignificance, the vast majority of spices, spice blends, and condiment-type vegetables are exempt from mandatory nutrition labeling. FDA found, however, that one spice (paprika) and one spice blend (chili powder), exceed the cutoff levels for one or two nutrients. Using the appropriate rounding procedures, paprika is over

the cutoff for vitamin A (6 percent of the RDI), and chili powder is over the cutoff for both vitamin A (4 percent of the RDI) and sodium (5 mg) per ¼ teaspoon serving. The levels at which these nutrients are nutritionally insignificant (i.e., the amounts that can be rounded to zero) are less than 2 percent of the RDI for vitamin A and less than 5 mg for sodium. Therefore, under the act, paprika and chili powder will have to be nutrition labeled (see Ref. 16, p. 16: "Foods such as certain spices, which have insignificant amounts of most but not all nutrients, are covered by the nutrition labeling requirements."). Because not all spices and spice blends are nutritionally insignificant, they are not included as a category under § 101.9(j)(4).

Condiment-type dehydrated vegetables, flavor extracts, and food colors do meet the criteria for foods of no nutritional significance and, therefore, are exempt from mandatory nutrition labeling. As with unsweetened coffee and tea, § 101.9(j)(4) will include these examples of nutritionally insignificant foods.

199. One comment suggested that "fun foods" defined as foods with empty calories (i.e., those with no nutrients other than calories), such as plain sugar candies, gum, and carbonated beverages, should be exempt from mandatory nutrition labeling except for a declaration of calories and the statement "no other significant sources of nutrients." The comment argued that the statement "Contains less than 2 percent of the RDI" for such foods is deceptive and miseducates consumers.

FDA advises that these types of foods would qualify under § 101.9(f) for the simplified label and would only be required to list the core nutrients, not the statement "Contains less than 2 percent of * * *." Moreover, Congress did not provide for an exemption of such a category of foods in the statute. Therefore, the agency is taking no action on this comment.

200. The pickle industry commented that, as a cost-saving measure, only sodium content (as is permitted under current regulations) should be required to be labeled on dill pickle products, rather than the full simplified format. The comment argued that, even though a serving of dill pickles also contains 1 g of carbohydrate, sodium is the only nutrient of any concern to consumers.

FDA rejects this comment. Section 403(q)(5)(C) of the act exempts from nutrition labeling foods that contain insignificant amounts of all of the nutrients required within nutrition labeling. The same section also provides for a simplified form of nutrition labeling if a food contains insignificant amounts of more than one-half the mandatory nutrients. No provisions of the 1990 amendments would allow for declaration of only a single nutrient in nutrition labeling. Accordingly, FDA is not making the suggested changes in the regulations.

201. One trade association commented that bottled water products have little or no nutritional value, and that such products should be exempt from mandatory nutrition labeling. The comment asserted that the following industry practices should be permitted without triggering nutrition labeling obligations: (1) Bottlers should be allowed to add back minerals as flavor enhancers that are removed during purification and declare "minerals added" on the principal display panel; (2) bottlers should be allowed to describe bottled water with natural or added fluoride as "fluoridated water;" (3) bottlers should be allowed to add sodium fluoride or add back trace minerals that may contain sodium as an incidental additive and still be permitted to claim "sodium free" on the label; (4) "essence" bottled water products (i.e., those containing 1 percent or less of juice or flavors) should be considered nutritionally insignificant; and (5) bottled mineral water products should be permitted to have a listing on the label of certain minerals, e.g., sodium, bicarbonate, calcium, magnesium, and other trace minerals in mg per liter in addition to a declaration of total dissolved solids content (which some state laws currently require). The comment argued that the EC Directive on Nutrition Labeling expressly exempts mineral water and other waters from nutrition labeling, and, for the sake of harmonization, FDA should do likewise.

FDA points out that, separate from this rulemaking on nutrition labeling to implement the 1990 amendments, the agency is in the process of amending its regulations on bottled water, partly in response to a petition from the trade association that submitted the comment. The bottled water regulations will address certain aspects of labeling apart from nutrition labeling, e.g., definitions, information about mineral content, and required label statements. Under the 1990 amendments, Federal regulations will preempt any State standards of identity that are not identical to it (section 403(a)(1) of the act).

A recent IOM report, "Food Labeling: Toward National Uniformity" (Ref. 113), noted that many States have expressed concern about the heightened potential for consumer confusion because of the increased number of bottled water products on the market and the aggressive marketing and advertising claims of superiority made for them. Thus, FDA maintains its position that nutrition information relating to food must be provided for all products, including bottled and mineral water, that contain more than insignificant amounts of any of the nutrients or food components that are required to be listed, or whose label, labeling, or advertising contains a nutrient content claim or any other nutrition information in any context. For products that qualify for the simplified format, if manufacturers voluntarily declare nutrients allowable under § 101.9(c) that are not among the 14 required nutrients (e.g., potassium), the required statement "Not a significant source of _____," must be used, with the blank filled in with the name of any of the 14 required nutrients or food components that are not present or are present in insignificant amounts. Moreover, if a product is voluntarily enriched or fortified with added vitamins or minerals, any such nutrients must be declared using the simplified format and followed by the above statement. Thus, a product labeled as "bottled water, minerals added" will have to bear nutrition labeling.

The agency considers the identity statement "fluoridated water" misleading if the product is derived from a source naturally containing fluoride. Use of the term "fluoridated" represents that fluoride has been added in the processing. Thus, the term "fluoridated water" should be used to describe only products to which fluoride has been added in the manufacturing process, and such products would be required to bear nutrition labeling that complies with the simplified format.

Bottled water products containing juice or other flavors are subject to the same nutrition labeling requirements as any other food. If a product meets the criteria for no nutritional significance, and no claims are made, then nutrition labeling is not required. A "sodium free" declaration on bottled water or on any other food label will trigger nutrition labeling, because such a claim promotes the nutritional properties of the product.

202. One comment stated that, to avoid varying interpretation, FDA should clarify what it means by the term "implicit" as it applies to nutrient content claims or information that will bar a food from an exemption from nutrition labeling under the "no nutritional significance" provisions.

A thorough discussion of implicit claims may be found in the companion documents on nutrient content claims and health claims, found elsewhere in this issue of the **Federal Register**.

D. Foods for Infants and Children Less Than 2 Years of Age

In the mandatory nutrition labeling proposal (§ 101.9(h)(4)) and in the supplementary proposal (§ 101.9(j)(4)), the agency proposed to require that foods, other than infant formula, that are represented or that purport to be specifically for infants and toddlers less than 2 years of age bear nutrition labeling, except that such labeling shall not include information on the number of calories from fat or the amount of saturated fat and cholesterol present in the food.

203. The comments supported this proposal. One comment, noting that proposed § 101.9(j)(4) refers to "toddlers less than 2 years of age" and other references in § 101.9 refer to toddlers as children less than 4 years of age, recommended that "children less than 4 years of age" be used, or that the term "toddler" be clarified. Another comment pointed out the practical fact that some foods used in the 1 to 2 year age bracket are also used by some children up to 4 years of age as well as by adults who have problems chewing food.

FDA does not agree that these special labeling requirements proposed for foods for infants (other than infant formula) and toddlers less than 2 years of age should be extended to children less than 4 years of age despite the fact that no other nutrition labeling requirements use 2 years of age as a cutoff. The agency does not believe there is scientific support to change the cutoff to 4 years because dietary recommendations for very young children are specific in citing 2 years of age as the age under which dietary modifications are not appropriate. For instance, the "Report of the Expert Panel on Blood Cholesterol Levels in Children and Adolescents" of the National Cholesterol Education Program (NCEP) states:

> The fast growth of infants requires an energy-dense diet with a higher percentage of calories from fat than is needed by older children. Based on current knowledge, it is inappropriate to apply nutrient guidelines for fats, cholesterol, and calories to children under 2 years of age.

(Ref. 114.)

and:

> As toddlers over 2 years of age begin to eat with the family, they may safely make the transition to this [recommended] eating pattern.

(Ref. 114.)

However, FDA believes that some clarification is needed as to the types of foods addressed in § 101.9(j)(4) (which is redesignated as § 101.9(j)(5)(i)). The agency advises that the infant and toddler foods to which the special labeling requirements are intended to apply are the types of foods represented in § 101.12(b), Table 1 entitled "Reference Amounts Customarily Consumed: Infant and Toddler Foods" in the rule entitled "Food Labeling; Serving Sizes" published elsewhere in this issue of the **Federal Register**. FDA notes, however, that in its serving size reproposal (November 27, 1991, 56 FR 60394 at 60397), "toddlers" was interpreted to mean children 1 through 3 years of age. Therefore, the agency advises that no special significance should be given to the word "toddler;" rather it is the age category that is important. To reduce the possibility of confusion, FDA is replacing the word "toddler" with "children." The distinguishing characteristic of foods to which the special labeling requirements in § 101.9(j)(5)(i) apply is that they are specifically represented or purported to be "for use by infants and children less than 2 years of age." Foods represented or purported to be for use by "children less than 4 years of age" or by "children 3 or more years of age" are not subject to the special labeling requirements of § 101.9(j)(5)(i) but should fully declare required information on fats and cholesterol.

With regard to the comment that these foods are sometimes used by older children or adults, FDA acknowledges that this occurs. The agency believes, however, that the represented use of the product must be the deciding factor. Inasmuch as the foods to which § 101.9(j)(5)(i) applies are represented to be for use by infants and children less than 2 years of age, the agency considers the use of these types of foods by children over 2 years of age or by older persons to be not particularly relevant in determining how these foods should be labeled. Accordingly, FDA has not made any change to § 101.9(j)(5)(i) in response to this comment.

204. One comment stated that the word "or" was used ambiguously in the proposed version of § 101.9(j)(5)(i) so that it was not clear whether "calories from saturated fat" or "saturated fat content" was prohibited. The comment also suggested that information on calories from saturated and unsaturated fat and the amount of unsaturated fat also should be prohibited, and that § 101.9(j)(5)(i) should be clarified by enumerating those parts of § 101.9(c) that are affected.

FDA agrees that all information relating to fatty acids should be prohibited on foods represented or purported to be for use by infants and toddlers (i.e., children) less than 2 years of age. In the proposed version of § 101.9(j)(5)(i), FDA only specified the fatty acid component that is required in nutrition labeling.

Therefore, to make the suggested change and to clear up any confusion, § 101.9(j)(5)(i) is modified to state: "* * * such labeling shall not include calories from fat ((c)(1)(ii) of this section), calories from saturated fat ((c)(1)(iii)), saturated fat ((c)(2)(i)), polyunsaturated fat (c)(2)(ii)), monounsaturated fat ((c)(2)(iii)), and cholesterol ((c)(3))."

205. One comment suggested the additional exclusion of fiber on labels of foods for infants, citing a statement made by the American Academy of Pediatrics that fiber probably is not needed in infants less that 1 year old.

FDA, in reviewing the reference cited by the comment (Ref. 115), noted that on the same page as this cited statement is the additional statement that more work needs to be done before any firm recommendations can be made on dietary fiber in pediatric nutrition.

FDA is thus not convinced that dietary fiber should be excluded from nutrition labels for foods intended for infants and children less than 2 years of age. Most foods included in Table 1 of § 101.12(b) in the final rule entitled "Food Labeling; Serving Sizes," published elsewhere in this issue of the **Federal Register**, contain less than 1 g of fiber per 100 g of edible portion (Ref. 116). Under usual circumstances, these levels would seem to preclude the consumption of high-fiber, low-calorie diets by infants or children under 2 years of age who consume such foods. Also, because dietary fiber has a natural laxative effect, the label declaration of fiber content may be useful information to the purchasers of these foods.

206. A comment to the format proposal objected to the inclusion of DRV's on foods for infants and toddlers because DRV's were not proposed for infants or children less than 4 years of age, and labels on jars of baby food are too small to allow for the additional information. The comment argued that DRV's for adults and children 4 or more years of age are not appropriate for infants and toddlers, and that there could be serious health consequences if a parent tried to adapt an infant's diet to the proposed DRV's.

FDA agrees with the comment for the reasons presented therein. In addition,

the agency believes that it is inappropriate and unnecessary to include the caloric conversion information required by § 101.9(d)(10) on foods intended for children less than 4 years of age because DRV's for this group have not been established and calculation related to such values may be misleading. Accordingly, for foods for infants and children less than 4 years of age, the agency is adding an exemption in § 101.9(j)(5)(ii) that excludes the declaration of Percent Daily Values for nutrients other than vitamins and minerals for which there are RDI's specifically established for infants and children less than 4 years of age. The exemption also applies to the footnote and caloric conversion information. Except for the omission of this information, which is otherwise required in § 101.9(d)(2)(ii), and the footnote and caloric conversion information required in (d)(9) and (d)(10), the format of the nutrition labels on such products should comply with the requirements of § 101.9 (d), (e), or (f), as appropriate. Examples of labels for foods for children less than 4 years of age and less than 2 years of age are given in appendix G.

E. Medical Foods

207. All comments received supported this exemption. In addition, several comments expressed support for the agency's intention, stated in the supplementary proposal (56 FR 60366 at 60377), to develop specific regulations for medical foods in the near future. Some comments suggested that nutrition labeling, intended for use by the general population, does not provide the kind of information needed by health care professionals or patients selecting or using medical foods. The comments noted that, in light of this exemption, there is little guidance for labeling of medical foods, other than general food labeling regulations, citing the need for labeling of nutrient content and purported uses and adequate and appropriate directions for use. In addition to the need for specific labeling requirements, some comments identified the need for quality control and good manufacturing practices specific for medical foods.

Section 403(q)(5)(iv) of the act exempts medical foods from nutrition labeling requirements. The agency agrees with the comments that the exemption for medical foods from nutrition labeling is appropriate considering that these products are not intended for use by the general population but rather are intended for use under the supervision of a physician for specific dietary management of a disease or condition. However, the agency also recognizes that the exemption creates a void in terms of specific labeling regulations suitable for these products. FDA believes, as noted in some comments, that the proper labeling of the nutrient content and purported uses of medical foods, perhaps in a different manner or in more detail than is required for other, more traditional foods, and adequate and appropriate directions for use, as well as assurances of the quality of medical food products, are all of vital public health interest. While these issues are beyond the scope of this rulemaking, the agency intends to develop regulations covering these aspects of medical foods in a future **Federal Register** document.

208. The comments support incorporation into the nutrition labeling regulations the definition of medical foods from section 5(b) of the Orphan Drug Act (21 U.S.C. 360ee(b)(3)). Section 403(q)(5)(iv) of the act incorporated this definition by reference into the statute, and FDA in proposed § 101.9(j)(7) to incorporate the statutory definition of "medical food" into the nutrition labeling regulations. Some clarification of this definition was included in the preamble and codified sections of the proposal, providing some guidance in regard to the intended use of a medical food. However, several comments cited particular products and asked whether the products would be regulated as medical foods.

FDA considers the statutory definition of medical foods, from section 5(b) of the Orphan Drug Act, to delineate the principal characteristics of medical foods. Additional clarification of this definition, contained in the preamble of the proposal, gives guidance on some of the types of products that the term "medical foods" pertains to by identifying a variety of foods that the agency regards as medical foods and some that are not presently regarded as medical foods. Criteria that product must meet to be considered a medical food are stated in the preamble of the proposal, as well as in proposed § 101.9(j)(7), redesignated as § 101.9(j)(8) in the final rule. FDA believes that this definition and the information clarifying the definition in the proposal are reasonable guides for use by industry in determining the characteristics of a medical food at present.

However, following review of the comments generated by this proposal, FDA acknowledges that further clarification of the types of products that are considered to be medical foods by the agency would be helpful to manufacturers. While these comments go beyond the scope of this rulemaking, the agency intends to address this issue in a future **Federal Register** document.

209. One comment suggested that in proposed § 101.9(j)(7)(v), the words "* * * provided only to a patient receiving active and ongoing medical supervision * * *" be changed to read "* * * intended only for a patient receiving active and ongoing medical supervision * * *." The comment stated that manufacturers can label products in a manner that gives a clear indication of the intended level of supervision, but that the word "provided" in this section might require a distribution system beyond the control of the manufacturer, restricting availability of medical foods to prescription status or distribution through an institution.

The agency agrees with this recommended change for the reasons stated in the comment and has modified new § 101.9(j)(8)(v) accordingly.

210. One comment suggested that the word "seeks" in proposed § 101.9(j)(7)(v) be changed to "require." The comment noted that while some patients receiving a medical food under the supervision of a physician are capable of seeking "medical care on a recurring basis," others receiving a medical food under the supervision of a physician are not able to actually "seek medical care" on their own (e.g., a comatose patient).

FDA agrees with the suggested change. The agency acknowledges that a medical food, under the supervision of a physician, may be consumed by, or be administered enterally to, some patients capable of seeking medical care and may be administered enterally to other patients who may be too ill to actively seek medical care. In both instances, the patient may require a medical food for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation. FDA has modified § 101.9(j)(8)(v) accordingly.

F. Foods Shipped in Bulk Form

211. FDA received many comments that supported proposed § 101.9(j)(8) that exempts foods shipped in bulk form. A few comments sought clarification of this exemption, requesting that new § 101.9(j)(8) include a statement that flavors and other food ingredients (as opposed to processed foods) shipped in bulk form from one manufacturer to another for use in the manufacture of other foods are exempt.

FDA intended the term "processed" in § 101.9(j)(8) (redesignated as

§ 101.9(j)(9)) to indicate that food ingredients used in the manufacture of other foods were exempt, maintaining the scope of current § 101.9(h)(8). However, for further clarification, FDA is modifying § 101.9(j)(9) as requested to state:

> Food products shipped in bulk form that are not for distribution to consumers in such form and that are *for use solely in the manufacture of other foods or that are* to be processed, labeled, or repacked at a site other than where originally processed or packed. (Emphasis added).

G. Foods for Institutional Food Service Use

212. Several comments objected to proposed § 101.9(j)(9) that would require manufacturers or distributors of foods for institutional food service use (i.e., for use by hospitals, schools, prisons) to provide nutrition information required by this section directly to the institutions on a current basis. The comments stated that this requirement was in conflict with section 403(q)(5)(A)(i) of the act, which exempts food that is sold for sale or use in restaurants or other establishments in which food is served for immediate human consumption. The act does not differentiate between food served in institutional and noninstitutional settings. In fact, the comments pointed out that the legislative history specifies that similar food service establishments include cafeterias and hospitals.

FDA agrees with the comments and has deleted proposed § 101.9(j)(9) to bring the final rule into compliance with the 1990 amendments. To clarify that institutional food service establishments are included under the exemption for restaurants and other establishments, FDA has added them as examples in § 101.9(j)(2)(ii).

However, the agency finds merit in other comments that supported nutrition labeling of foods sold to restaurants and other food service establishments in order to enable food service operators to become more aware of the nutritional content of foods they serve, to offer more healthful menu options, and to use more accurate descriptors on their menus. The agency, therefore, encourages manufacturers, packers, and distributors to make nutrition information available to food service operators whenever possible.

H. Single-Ingredient Packaged Fish Products

213. Comments received from the fish industry objected to the inconsistencies between the voluntary nutrition labeling program for raw fish and the mandatory nutrition labeling program. They pointed to the potential for confusion when raw fish under the voluntary program are labeled on an "as consumed" (i.e., "as proposed") basis, and the same fish, when frozen and packaged by a manufacturer, are labeled on an "as packaged" basis. They also pointed to the inconsistency with the USDA proposal that allows single-ingredient raw meat and poultry items, whether frozen or unfrozen, to be under a voluntary program with nutrition information reported on either an "as packaged" or "as consumed" basis.

FDA agrees that consumers may be confused to find inconsistent nutrition labeling on two packages of the identical fish (e.g., fillet of flounder) when one is under the voluntary program for raw fish, and the other is under the mandatory program for frozen packaged fish. According to the final rule for the voluntary program (November 27, 1991 56 FR 60880; corrected at, March 6, 1992, 57 FR 8174), nutrition information for raw fish is to be reported for a 3 ounce, cooked edible portion (see appendix B, 57 FR 8174 at 8175). The final rule on serving size, published elsewhere in this issue of the **Federal Register**, provides that under the mandatory nutrition labeling program, nutrition information for frozen packaged fish is to be reported for that amount required to prepare 85 g (approximately 3 ounces) of cooked fish (§ 101.12 (b) and (c)) but is to be based on the product "as packaged" (§ 101.9(b)(9)).

To reduce the inconsistencies in nutrition labeling between raw versus frozen packaged single-ingredient fish, and between single-ingredient fish versus single-ingredient meat and poultry, FDA is adding a special labeling provision for fish in § 101.9(j)(11) that allows single-ingredient fish to be labeled on a cooked (i.e., "as prepared") basis consistent with the voluntary program for fish and with USDA's rules for single-ingredient meat and poultry products. Packaged fish that contain added ingredients such as water, salt, or additives such as sodium tripolyphosphate are considered multi-ingredient processed packaged fish products and must continue to be labeled on an "as packaged" basis.

However, in the companion document on nutrient content claims published elsewhere in this issue of the **Federal Register**, claims such as "lean," "extra lean," and "low fat" are based on as packaged values. Therefore, single ingredient packaged fish products that make such claims must provide nutrition information on an "as packaged" basis.

I. Raw Fish in Voluntary Nutrition Labeling Program

214. One comment objected to the manner in which FDA defined "raw" for the purpose of determining what fish products are covered by the exemption in proposed § 101.9(j)(10) that subjects the food to the voluntary nutrition labeling program. The comment stated that "absent a definition in the NLEA, the term "raw" means "uncooked" regardless of whether or not the product is frozen and, therefore, packaged frozen raw fish should not be subject to mandatory nutrition labeling.

FDA discussed its interpretation of the word "raw" as it pertains to fish in its proposed rule (July 2, 1991, 56 FR 30468 at 30470) and final rule (56 FR 60880 at 60886) implementing the voluntary nutrition labeling program for raw fruit, vegetables, and fish. Lacking legislative guidance, the agency chose to draw a practical line in terms of retail selling practices and program implementation rather than one based on a strict definition of the term "raw." While the agency included in the voluntary program those fish that are generally sold raw (i.e., not heat treated), it also included thermally processed shelled or unshelled lobster, crab, and shrimp. The intent was to allow for voluntary nutrition labeling of fish that are generally sold refrigerated, or on ice, or are alive at purchase in fish stores or in the fresh fish section of grocery stores and that are not packaged or are packaged by the retailer or by a packer. These are the types of products for which mandatory nutrition labeling is most impractical. In contrast, providing nutrition labeling for raw, frozen fish that are packaged by a manufacturer (usually in a box with a printed label and brand name) and sold in the frozen food case of a grocery store is no more difficult for a manufacturer than providing nutrition labeling of other packaged foods. Thus, these products appropriately come under the mandatory nutrition labeling program.

The agency has made a similar distinction with frozen packaged raw fruit and vegetables and has received no comment on it. It is likely that the greater concern on the part of the fish industry was a result of the inconsistency between nutrient values to be declared in the voluntary versus mandatory programs (i.e., nutrient values based on "as prepared" versus "as packaged" levels, respectively). The agency believes the exemption in new § 101.9(j)(11) should eliminate this concern. Accordingly, FDA sees no need to amend its interpretation of the term "raw."

The agency would like to clarify, however, a misinterpretation of the above definition of raw fish that appeared in comments. FDA considers raw shellfish in or out of the shell to be under the voluntary program, whether they are sold bagged in plastic containers or displayed loosely in trays or bowls. In addition, pasteurized crab meat that is not shelf-stable and is sold on ice or refrigerated would be included under the voluntary program, whereas canned pasteurized crab meat that is shelf-stable would be subject to mandatory nutrition labeling regulations. As discussed above, the agency considers nutrition labeling of the refrigerated product that may not have gone through a manufacturing plant impractical. However, the processing of the canned product is standardized, and nutrition labeling can be easily accomplished and is required.

J. Meat Products Regulated by FDA

215. Several comments recommended that nutrition labeling of game meat should be on a voluntary rather than mandatory basis. One game meat association stated that because buffalo is a red meat, it should be exempt from FDA regulations and should be allowed the option of voluntary labeling under USDA guidelines. The comment also requested that any required nutrition information should be allowed to be displayed at the point of purchase to reduce costs associated with nutrition labeling.

A number of comments expressed concern that the cost of analytical testing and nutrition labeling would be prohibitive for the small game meat producer. A request was made that an economic impact study be conducted of the effect of the proposed regulations on the buffalo industry before any final rule is issued. Comments suggested small business exemptions for producers marketing less than from 100,000 to 150,000 pounds per year per each product label. A few comments also requested that introductory test market, seasonal, short run, and experimental products should be exempt from nutrition labeling.

FDA is responsible for the regulation of all meats not covered by USDA under the Federal Meat Inspection Act and the Poultry Products Inspection Act (e.g., deer, bison, rabbit, wild turkey, or ostrich, hereinafter identified as "game meats"). Therefore, the law does not provide an option for such products to be covered by USDA guidelines. However, FDA appreciates the fact that game meat producers have had little, if any, experience with nutrition labeling, and that analytical data base information is scarce. Accordingly, the agency will give game meats as much latitude as possible under the 1990 amendments.

Because many game meat producers are small enterprises, it is possible that some will fall under the current small business exemption. Many of those that do not may do so in the future if a legislative amendment is passed to increase the exemption. However, if an amendment is not forthcoming, all nonexempt producers must provide the required nutrition information when the regulations become effective.

While the statute does not allow FDA to include raw game meats under the voluntary nutrition labeling program for raw fruit, vegetables, or fish, for consistency among all animal flesh products, single-ingredient game meat products (frozen or unfrozen, packaged or unpackaged) will also be included in § 101.9(j)(11) that permits the information to be declared on either an "as purchased" or "as prepared" basis (see comment 213 of this document).

Also, in response to a comment, FDA is adding § 101.9(j)(12) to the final regulations to allow nutrition information to be provided in accordance with paragraph (a)(2) of this section which allows the required information to be placed on labeling, that is on signs, posters, tags, or in binders or booklets displayed at the point-of-purchase. FDA believes that this action will allow game meat producers to give first priority to nutrient analyses and data collection and to update nutrient declarations more frequently than would be possible if the information were printed on food labels.

216. One comment requested the use of a data base to reduce the cost of nutrition labeling for game meat. It was noted that the nutrient composition of buffalo meat varies widely according to whether the animal was grain fed or range fed and according to age at slaughter. Another comment recommended that nutrient information for buffalo meat come from actual sample testing and not computer composites. The comment requested that FDA/USDA "do the same complete nutritional study for the buffalo industry as it does for other industries enveloped by the proposal."

FDA acknowledges that there is limited nutrient data available on game meats. The agency advises that it does not conduct nutrient analyses for any commodities; however, it is willing to work cooperatively with game meat producers to produce a valid nutrient data base. To this end, the Agriculture Research Service of USDA has experience in working collaboratively with industry in developing food composition data (Ref. 117).

217. Many game meat processors requested exemption from nutrition labeling for custom services. Custom processed meat includes wild game or domestic stock that is butchered to the specifications of the customer. The meat may have been sold to the customer or brought in by the customer for butchering. Comments stated that because the customer owns the animal at the time of butchering, the nutritional aspect of the meat product is the responsibility of the customer.

Consistent with similar regulations being issued simultaneously by USDA for nutrition labeling of meat and poultry products, FDA is exempting custom processed fish and game meats from mandatory nutrition labeling. This exemption is found in new § 101.9(j)(11)(ii). Legal authority for this is that what is being sold is not the food but the processing. Thus, the food is not subject to section 403(q) of the act.

K. Small Packages

218. A number of comments supported the small package exemption proposed in § 101.9(j)(11). While a few comments supported the provision that nutrition labeling be provided for foods in small packages at the point of purchase in accordance with paragraph § 101.9(a)(2), many other comments objected to this requirement. Several of these comments objected on the grounds that the 1990 amendments did not include a requirement for point of purchase disclosure for small packages, or that point of purchase displays of nutrition information would create "unnecessary clutter" and "place an undue burden on retailers" to find space for the information. One comment stressed the economic impact the proposal would have on supermarkets, especially those with front-end operations and checkout lanes where a wide variety of small package items are offered for sale. The comment stated that such areas would have to be reconfigured with fewer items available because of space lost to signage and fewer inventory changes made throughout the year. A comment raised a question about who would be held responsible if the information was not available at the point of purchase. Comments recommended that manufacturers, not retailers, should be responsible for nutrition information on all packaged foods. A suggestion was also made that interested consumers could refer to larger retail packages of the same product or could write or call the manufacturer for the nutrition

information by using an address or telephone number given on the package label.

FDA is persuaded by the comments that it is impracticable to require point of purchase display of nutrition information for small packages. However, because section 403 (q)(5)(B) of the act states only that the nutrition labeling requirements shall not apply to the label of the food, not the labeling as is included in section 403(q)(5)(C) and (q)(5)(D), the agency concludes that nutrition information about food in small packages must be provided to consumers through alternative means. The agency agrees with the comments that manufacturers should bear the responsibility for nutrition labeling of packaged foods and finds merit in the suggestion that manufacturers provide an address or telephone number on the package for consumers to write or call for nutrition information. FDA believes that almost all small packages should be able to add a short phrase, such as "For nutrition information, call 1-800-123-4567" to the label. In fact, many packages currently give an address or telephone number for consumer use in obtaining additional information about the product.

Therefore, FDA has modified § 101.9(j)(11), redesignated as § 101.9(j)(13)(i), to delete the requirement that foods in small packages that bear no nutrition claims or other nutrition information provide the required nutrition labeling in accordance with § 101.9(a)(2). The agency replaced it with a requirement that the manufacturer clearly state on the package label where a consumer may write or call to obtain the required nutrition information. If a manufacturer finds that it is impracticable to comply with even this requirement on a particular product, the manufacturer should write to the agency in accordance with § 101.9(g)(9) (see section VI.P.3. of this document).

219. A few comments from health professional organizations expressed the belief that the 12 square inch standard for "small packages" was too large, and that consumers should have as much information as possible about what they purchase and consume. One comment stated that "with the increase in fabricated foods and single serving size packaging, [they were] convinced that nutrition information can and should go on less space," adding that by using an abbreviated format, nutrition labeling is possible on smaller packages, down to 8 square inches.

However, several other comments objected to the 12 square inch definition for small packages, stating that it would not allow enough space for all the required information on the label, especially on a product with a lengthy ingredient list. The comments stated that the 12 square inch standard for exempting small packages was established years ago when much less information was required on food labels (i.e., before mandatory nutrition labeling). The comments also expressed concern that attempting to include all of the required information in 12 square inches would result in a label that would not be legible, making it difficult for sight-impaired or elderly persons to read. Comments also said that such a presentation would discourage use of the nutrition information, thereby undermining the purposes of the 1990 amendments.

Two manufacturers commented on the unique space problems arising when more than one language is used on small packages inasmuch as § 101.15(c)(2) requires that if a language other than English is used, all information on the label must be printed in both English and the other language. One comment pointed to the fact that the United States has become an increasingly bilingual nation, making Spanish-language labeling a "necessity in many parts of the country."

Several comments requested a more flexible rule based on "practically available space" or "usable surface space" on labels. One comment stated that the term "surface area available to bear labeling" is newly coined and unfamiliar and likely to be confusing. The comment recommended that the exemption be couched in terms of "total square inches on the information and alternate panels," which are familiar terms to manufacturers.

Other suggestions included: (1) Using a 20 square inch surface area, (2) excluding the principal display panel from the 12 square inch requirement, (3) excluding odd shaped parts of packages from the total surface area available for nutritional labeling, (4) allowing a linear (i.e., string) format for the nutrition information, (5) making the nutrition profile optional, (6) allowing for abbreviations of nutrients, (7) deleting the requirement for declaration of "Servings per container" on single-serving containers, and (8) allowing required nutrition information to appear anywhere on the package expected to be read by consumers rather than just on the information panel as required by § 101.2. In regard to the latter comment, one comment suggested that § 101.2 be modified to allow required information to be placed on other label panels adjoining the principal display panel or the information panel when there was insufficient space on a single panel.

A few comments stated that no manufacturer should be required to change its existing label style or container size to accommodate nutrition labeling. The comments urged that areas of a package not traditionally used for labeling should be excluded from the total surface area (e.g., many companies do not use lids of jars, necks of bottles, or bottoms of cans for labels). One comment recommended that current company practices be grandfathered until the company changes its packaging or container.

The agency received additional comments regarding small package limitations in response to the format proposal. Several comments from manufacturers of smaller size products such as candy rolls and bars, chewing gum, canned fish, and cookies stated that such labels could accommodate only the CONTROL format. Two comments suggested raising the minimum 12 square inch requirement for "small packages" to 13 square inches.

A number of comments addressed the inclusion of the DRV's on the labels of small packages. These comments apply to inclusion of the footnote providing calorie-specific recommended nutrient amount information specified in § 101.9(d)(8)(i).

The majority of comments asserted that it would be difficult to accommodate the DRV's without a relaxation of the minimum requirement of 12 square inches of printable label space. Most of those seeking relief suggested the option of listing DRV's in linear rather than column array over an intermediate range of printable package area. Alternate upper limits suggested were 20 and 26 square inches or no more than 30 percent of printable package area devoted to the nutrition label. One manufacturer provided support for 20 square inches as a minimum area below which DRV's could not be accommodated without violating minimum type size or principal display panel size requirements. It submitted executions of the proposed and alternate formats for several existing products. One comment suggested several principles to be followed by FDA in establishing a range within which the DRV listing could be modified or deleted while preserving legibility and remaining in conformance with existing labeling requirements concerning type size and area devoted to the principal display panel.

FDA acknowledges the need to give consumers as much information as possible. The agency is persuaded,

however, that with requirements for more nutrition-related information, it may be difficult to get all of the required information on packages that just meet or slightly exceed 12 square inches of surface area available to bear labeling, particularly for products that do not qualify for the simplified format. However, in light of the exemption from nutrition labeling on the package label for products with less than this amount of usable surface space, provided that no nutrition claim is made (see preceding comment), the agency believes that exempting a larger number of foods by increasing the definition of "small package" size would undermine the intent of the 1990 amendments.

However, based on the comments, FDA has concluded that justification exists for developing a graduated system that would allow added flexibility for foods in an intermediate package size group. To select the dimensions of such an intermediate sized package, FDA reviewed comment suggestions, examined the space requirements of the required label with the calorie-specific daily values, and reviewed data on available label area for a sample of packaged foods (Ref. 117a). The agency is rejecting suggestions such as the use of only "practically available space" or "usable surface space" or the exclusion of "oddly shaped parts of packages" because there is a significant potential for differences of opinion about what is "practically available," "usable," or "oddly shaped." The remaining suggestions are to exclude the principal display panel, to use an upper limit of 20 or 26 square inches of surface area available to bear labeling, or to require that no more than 30 percent of the surface area available to bear labeling be devoted to the information panel.

The agency believes that the suggestion to apply the 30 percent criterion to space requirements necessary to comply with FDA regulations has merit. Based on current requirements (see § 101.1(b) and (c)), the principal display panel can be considered to cover 40 percent of the total surface area available to bear labeling. On the assumption that no more than half of the remaining 60 percent of the label should be required to be devoted to FDA-required information (i.e., the nutrition label and ingredient list), 30 percent of the total surface area would be used for such information. This is consistent with the comment.

Based on the data examined, FDA believes an upper limit of 40 square inches of surface available to bear labeling is appropriate to define an intermediate sized package. The smallest legal sized execution of the format required under § 101.9(d) is approximately 7 square inches. For many processed foods, the addition of the ingredient list could bring the space needed for presenting this FDA-required information to 11 square inches. Using the 30 percent factor, this information could be accommodated on packages with 37 square inches available to bear labeling. In order to provide incentive to allow sufficient space to make the label readily observable and easily comprehensible, the agency has decided to round this number up to 40 square inches. The agency is providing for this upper limit in § 101.9(j)(13)(ii).

The agency does not agree with the comment that the term "surface area available to bear labeling" is newly coined and unfamiliar, inasmuch as it has been used in § 101.2(c)(3)(i) for 17 years.

FDA looked to the comments for suggestions of added flexibility for the labeling of foods in intermediate sized packages available to bear labeling. Suggestions in the comments included: Allowing a linear (i.e., string) format for nutrition information (including the DRV listing), making DRV's optional, allowing for abbreviations, deleting the requirement for declaration of "Servings per container" on single-serving containers, and allowing required nutrition information to appear in other places than those required by § 101.2 (i.e., the information panel). Dependent upon the circumstances of a particular package size and shape, the agency is not opposed to the use of any of these suggested methods. In addition, as provided for in § 101.9(g)(9), manufacturers may request special allowances for provision of the required information on tags affixed to the product according to § 101.9(a)(2) as discussed in section VI.P.3. of this document, Foods For Which Labeling Is Impracticable.

In regard to the request to delete the requirement for declaration of "Servings per container" on single serving containers, FDA finds that inasmuch as the declaration of "Serving size" on such products will specify that the serving is the entire unit (e.g., 1 can or 1 bar), it would be needlessly repetitive to state that there is one serving per container. Therefore, FDA has modified § 101.9(d)(3)(ii) that pertains to all container sizes to state that "Servings per container" is not required on single serving containers as defined in § 101.9(b)(6).

While the provisions being made to increase flexibility are for the purpose of making it easier for manufacturers to place mandatory nutrition labeling on packages of an intermediate size, they may also be used on "small packages" (i.e., packages with less than 12 square inches of surface area available to bear labeling) whose labels are exempt under § 101.9(j)(13)(i) when manufacturers elect to provide a nutrition label on those foods.

FDA is providing in § 101.9(j)(13)(ii)(A) that the required nutrition information may be presented in a tabular fashion when the package shape or size cannot accommodate a column display on any label panel. This form of presentation is currently used on many foods in long rectangular or round packages, such as candy bars and is shown in Appendix H. In addition, to facilitate the provision of information on small packages, § 101.9(j)(13)(ii)(A) provides for the use of a tabular presentation on all products with less than 12 square inches of surface area available to bear labeling, regardless of the package shape. Further, if the label will not accommodate a tabular display, § 101.9(j)(13)(ii)(A) also provides that the required nutrition information may be presented in a linear (i.e., string) fashion.

In regard to abbreviations, one comment stated that the design limits of their company's printers for labels to be affixed to foods packaged in retail stores limited the description of nutrients to 10 characters. While the agency is concerned about the use of abbreviations and any possible consumer confusion they may cause, FDA believes their use under limited and controlled conditions may be preferable to overcrowding within the nutrition label. Therefore, based on this comment, the agency is providing the following abbreviations in § 101.9(j)(13)(ii)(B) for those mandatory nutrients whose names exceed 10 characters.

Serving size: Serv. size
Servings per container: Servings
Calories from fat: Fat cal
Saturated fat: Sat fat
Cholesterol: Cholest
Total carbohydrate: Total carb
Dietary fiber: Fiber

Section 101.9(d)(9)(iv) allows these abbreviations to also be used in a footnote within the nutrition label.

As discussed above in section V. of this document on the format of the nutrition label, FDA is providing in § 101.9(j)(13)(ii)(C) that the footnote and caloric conversion information required in § 101.9(d)(9) and (d)(10) may be omitted on intermediate sized packages. When the footnote required by § 101.9(d)(8) is omitted, an alternate footnote must be used that states:

"Percent Daily Values are based on a 2,000 calorie diet."

The agency believes that concerns expressed in comments requesting that the nutrition information be allowed to appear elsewhere on the package rather than just on the information panel as required by § 101.2 (see § 101.9(i)) are generally addressed by § 101.2(a)(1). This section states that if the information panel is too small to accommodate the necessary information or is otherwise unusable label space, e.g., folded flaps or can ends, the panel adjoining to the right may be used. However, in recognition of the increased need for this flexibility in packages with less than 40 square inches available to bear labeling, FDA is providing in § 101.9(j)(13)(ii)(D) that nutrition labeling on intermediate sized packages may appear on any label panel.

As a conforming change, § 101.9(c), (d), and (i) have been modified to reflect the provisions of § 101.9(j)(13).

In regard to the comments requesting an exemption or postponement based on current company labeling practices, FDA advises that Congress did not provide in the 1990 amendments for any such actions. The agency recognizes the possible economic burdens associated with changing labeling practices and has tried to incorporate sufficient flexibility to minimize the need for such changes but has no authority to prevent them. FDA advises that in § 101.1 the agency stated that, in determining the area of the principal display panel, tops, bottoms, flanges at tops and bottoms of cans, and shoulders and necks of bottles and jars were to be excluded. Therefore, it is reasonable to conclude that the agency will not include these areas in determining the "surface area available to bear labeling."

220. A comment requested clarification as to whether manufacturers of products that are sold in small packages that qualify for the small package exemption are required to omit nutrition information from the label and then present it through other means as required in proposed § 101.9(a)(2), or whether they may attempt to provide the nutrition labeling.

While comment 218 of this document addressed the underlying concern in this comment about the mandatory inclusion of required nutrition information in labeling at the point of purchase, FDA does not view this or any other exemption under § 101.9(j) (except for infant formula which is subject to other labeling requirements) as prohibiting a manufacturer from including nutrition labeling on the label of a food product. The agency encourages the inclusion of nutrition information on the label of exempted products whenever possible. To clarify the situation, § 101.9(j)(13)(i) has been modified to state that the new requirement for an address or telephone number for consumer use in obtaining nutrition information is to apply to products that qualify and use this exemption.

L. Shell Eggs

221. One manufacturer commented on the labeling of egg cartons, stating that proposed § 101.9(j)(12) allowing for the presentation of the required nutrition information immediately beneath the carton lid is as impractical for many egg cartons as requiring its display on the upper surface of the lid because both surfaces conform to the shape of the eggs. The comment suggested that packaging of this kind may not be readily imprinted at all. The comment further stated that eggs are a largely homogeneous agricultural commodity, and eggs sold at retail in their shells should all be treated alike with respect to nutrition labeling, whether the eggs are in bulk, on trays without cartons, or in cartons. The comment requested that eggs be exempt under 21 U.S.C. 343(q)(3) that allows the Secretary to provide that nutrition labeling be displayed at the point of purchase for foods received in bulk containers.

FDA is persuaded by the comment that it may be impractical for egg cartons that conform to the shape of the eggs to bear nutrition labeling. Accordingly, FDA is modifying § 101.9(j)(12) (redesignated as § 101.9(j)(14)) to allow the required nutrition information to appear on the inside or the outside of the carton, or on an insert that can be clearly seen when the carton is opened. By doing this, FDA is greatly expanding the total surface area available to bear labeling.

FDA rejects the suggestion that, because some eggs are sold in bulk, all eggs should be allowed to be labeled at the point of purchase according to the exemption for bulk foods (§ 101.9(j)(9)). As discussed above, nutrition labeling for eggs may appear on the egg carton or on a package insert. FDA concludes that there is no need to modify § 101.9(j)(14) to allow for further special conditions for shell eggs packed in cartons. If, in fact, a manufacturer finds it impossible to label a particular egg carton or to include a package insert, it may request a special allowance from the agency, as discussed in comment 223 of this document.

M. Multi Unit Packages

222. A few comments disagreed with the requirement in proposed § 101.9(j)(13)(iii) that each unit within a multipack state "this unit not labeled for retail sale." Comments stated that this requirement is redundant because § 101.9(j)(13)(i) and (j)(13)(ii) adequately prevent the product from being sold without nutrition labeling.

The agency does not agree that the requirement is redundant. Although multiunit containers may be enclosed and are not intended to be separated from the retail package under normal conditions of sale, occasionally the individual units are separated from the multiunit container and purchased separately. Proposed §§ 101.9(j)(13)(i) and (j)(13)(ii), redesignated as §§ 101.9(j)(15)(i) and (j)(15)(ii), state: "The multiunit retail food package labeling contains all nutrition information in accordance with this section;" and "The unit containers are securely enclosed within and not intended to be separated from the retail package under conditions of retail sale." These sections cannot guarantee that the units in a multiunit package will not be separated; e.g., frozen juice bars, soft drink bottles, and sticks of butter are sometimes separated from an enclosed multiunit package by consumers prior to purchase at the retail level. Therefore, FDA is not modifying the regulation.

223. A soft drink trade association requested a provision in the final rule to exempt from nutrition labeling glass bottles with lithographed labeling that are marketed in multi-unit packages. These bottles, the comment pointed out, are often loosely packed rather than securely enclosed. The comment made reference to the technical limitations of labeling glass by the lithograph method, and the impracticality of placing nutrition labeling on the individual bottles or "unit containers." The comment requested that the agency clarify the proposal to ensure the continued availability of lithographed bottle multiunit packages and suggested that the nutrition labeling information appear on the information panels of the multiunit retail package.

The agency acknowledges that there will be some circumstances in which strict adherence to the regulations (in this case the requirement that units be securely enclosed in the retail package) is not technologically feasible, or some other circumstance makes it impracticable. Proposed § 101.9(g)(8) would have allowed for alternative means of compliance or additional exemptions to deal with the situation when firms were unable to develop

adequate nutrient profiles. The agency concludes based on this comment that this latitude should be available for additional circumstances. Accordingly, FDA is modifying § 101.9(g)(8), redesignated as § 101.9(g)(9), to broaden its scope by stating "When it is not technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of this section (e.g., to develop adequate nutrient profiles to comply with paragraph (c)), * * *."

Additionally, FDA believes that actions taken to address technological or other problems on a case-by-case basis do not need to be established by regulation in response to a petition to initiate rulemaking. Therefore, the agency is replacing "establish by regulation" with "permit" in § 101.9(g)(9) and is deleting the reference to a petition, stating instead that firms in need of such special allowances shall make their request in writing to the Food and Drug Administration, Office of Nutrition and Food Sciences (HFF-200), 200 C St., SW., Washington, DC 20204. However, FDA concludes that no change is necessary in § 101.9(j)(15) in response to this comment.

N. Foods Sold from Bulk Containers

224. A food retailer wrote in support of the requirement in proposed § 101.9(j)(14) that nutrition labeling information for bulk foods be provided at the point of purchase. However, the comment took exception to the agency's intention to include within the requirement individually wrapped bulk food items such as candies, arguing that the exemption for small packages should apply to small individually wrapped food items that are sold in bulk.

FDA disagrees with this comment. The labels of individually wrapped small food items, such as bite size pieces of candy, are exempt from nutrition labeling under the small package exemption (§ 101.9(j)(13)) because of the lack of space needed to print the required information. However, under section 403(q) of the act, foods sold from bulk containers must be nutrition labeled whether or not they are individually wrapped. Nutrition labeling can, and should, be presented on the labeling of the bulk container or on a counter card, sign, or other appropriate device as identified in § 101.100(a)(2). Moreover, as discussed above, the exemption for small packages only applies to the label and not to a product's labeling. The agency reiterates its position as stated in the **Federal Register** of July 19, 1990 55 FR 29487 at 29505, and 56 FR 60366 at 60379:

> * * * Many foods, such as candies, cookies, and pasta, are offered for sale from large containers such as barrels or bins. FDA has traditionally required that these foods be labeled in accordance with section 403(i)(2) of the act through the use of a counter sign or card on the labeling of the bulk container [21 CFR 101.100(a)(2)]. The agency believes that nutrition labeling can be provided in a similar manner. Therefore, the agency will require nutrition information for such foods.

Accordingly, no changes are being made to § 101.9(j)(14), redesignated as § 101.9(j)(16).

225. Several other comments were received in support of the requirement in the proposed version of § 101.9(j)(16) that nutrition labeling information for bulk foods be provided at the point of purchase. Two comments recommended that nutrition information be provided in the form of brochures or "tear-off" sheets at the point of purchase, so that consumers can have the information available at home.

FDA agrees that tear-off sheets or brochures with the required nutrition information would be useful to consumers and encourages manufacturers to provide retailers with the required nutrition information in such form. Section 403(q)(3) of the act states: "For food that is received in bulk containers at a retail establishment, the Secretary may, by regulation, provide that the nutrition information required * * * be displayed at the point of sale." Thus, the statute does not specify the form in which this information is to be provided. Accordingly, FDA has not made the recommended change.

226. A retail ice cream manufacturer requested that the proposed version of § 101.9(j)(16) be clarified so that scoops of ice cream that are dispensed by store employees from bulk ice cream containers are clearly not subject to the "sold from bulk containers" requirement.

FDA advises that it is not necessary to exempt ice cream from the requirements of § 101.9(j)(16). Ice cream that is dispensed by store employees from bulk ice cream containers at an ice cream store is for immediate human consumption and would therefore be exempt from mandatory nutrition labeling under revised § 101.9(j)(2)(ii).

227. A retail grocery chain stated that popular bulk food items sold from bins and barrels but packaged by clerks for customer convenience should not be required to have nutrition labeling on each package.

FDA advises that § 101.9(j)(16) allows food products sold from bulk food containers to display the required nutrition information "either on the labeling of the bulk container plainly in view or in accordance with provisions of paragraph (a)(2) of this section." Section 101.9(a)(2) allows use of counter cards, signs, tags affixed to the product, or other appropriate devices. Accordingly, the containers such foods are put into when sold to the consumer need not bear nutrition labeling as long as the required nutrition information is plainly in view, regardless of whether it is the consumer or a store employee that packages the product. However, if the foods are packaged in an area that is off-limits to customers, and the information is not plainly in view, the required nutrition information must be available on the package label or in labeling adjacent to the packages accordingly to the provisions of § 101.9(a)(2).

O. Foods Used as the Sole Item of the Diet

228. One professional organization and one consumer interest group wrote in support of FDA's tentative decision to delete the exemption in current § 101.9(h)(3) for foods promoted as the sole item in a diet (such as formulated weight-loss products) and to have the same labeling requirements for those products as all other foods. The consumer interest group stated that "considering the minimal long-term benefit from these products and the potential for harm from the unsupervised use of these products, FDA should consider greater labeling requirements for these products."

FDA intends to monitor the use and labeling of foods used as the sole item of the diet and, as discussed in the supplementary proposal (56 FR 60366 at 60378), will consider at a later date whether there should be additional or different requirements for the nutrition labeling of these products.

P. Other Requests for Exemption

1. Donated Foods

229. Two comments from food banks requested an exemption from mandatory nutrition labeling, citing that food banks are nonprofit charitable organizations, and as such, it would be "unreasonably costly and unduly burdensome for (food banks) to be required to apply complete nutrition labeling to repacked food products." The comments stated that the exemption is necessary to ensure that mandatory nutrition labeling rules do not hamper the ability of charitable organizations to receive and distribute foods to needy individuals.

Section 403(q)(1) of the act requires nutrition labeling on food that "is intended for human consumption and is

offered for sale." Accordingly, donated foods that are given without charge to the ultimate consumer are not subject to mandatory nutrition labeling. This provision of the 1990 amendments was not included in the proposed implementing regulations. To correct this omission, the agency is modifying § 101.9(a) to state that "Nutrition information relating to food shall be provided for all products intended for human consumption and offered for sale * * *."

230. A second request from these foods banks was that food companies having inventories of foods not in compliance with new labeling rules after the effective date of section 403(q) of the act be permitted to donate those products to charitable organizations.

Section 10(a)(2) of the 1990 amendments states that the new nutrition labeling requirements shall not apply to foods labeled before the effective date. Therefore, companies will be able to continue to sell all foods that are labeled in compliance with current regulations before the effective date of section 403(q) of the act, May 8, 1993. As a result, there should be no inventories of labeled food that cannot be sold to consumers. The agency wishes to state, however, that it has long been the agency's policy that misbranded foods, such as those that have been the subject of a seizure or recall, can be donated to charitable organizations rather than being destroyed if they do not present a safety concern, and the recipient is fully informed as to the problem with the food (e.g., short weight).

231. Two comments expressed concern that if donated foods are exempted from nutrition labeling, the goals of nutrition labeling will not be met for individuals who rely on such foods.

In passing the 1990 amendments, Congress intended to require that consumers have the necessary information at their disposal to select diets that are consistent with dietary recommendations aimed at improving the health status of Americans. However, by requiring nutrition labeling only on foods offered for sale, Congress limited the coverage of the nutrition labeling requirements. Therefore, while the agency would encourage nutrition labeling on any foods repackaged or relabeled by charitable organizations, the statute does not require such labeling.

The agency is pleased to note, however, that in conversations with the Food and Nutrition Service, USDA, which administers the Food Distribution Program, the Food and Nutrition Service has stated that it plans to incorporate nutrition labeling on all foods that it distributes to individuals. The Food Distribution Program purchases surplus foods from American markets and distributes them to State agencies for further distribution to individuals and eligible local outlets.

2. Exported Foods

232. Comments from a trade association and a manufacturer requested that products intended for export be exempt from U.S. nutrition labeling regulations because they will necessarily be required to comply with the importing country's labeling criteria.

FDA advises that under section 801(e) of the act, foods intended for export will not be deemed misbranded under section 403 of the act under certain circumstances. Section 801(e) states that:

> A food, drug, device or cosmetic intended for export shall not be deemed to be adulterated or misbranded under this Act if it:
>
> (A) Accords to the specifications of the foreign purchaser,
>
> (B) Is not in conflict with the laws of the country to which it is intended for export,
>
> (C) Is labeled on the outside of the shipping package that it is intended for export, and
>
> (D) Is not sold or offered for sale in domestic commerce.

Thus, if a company complies with the requirements of section 801(e) of the act, it need not be concerned about misbranding the food by failing to comply with section 403(q) of the act.

3. Foods for Which Labeling Is Impracticable

233. Two dairy companies requested that returnable glass milk bottles be exempt from nutrition labeling because the total surface area available for labeling is much less than 12 square inches. The labeling surface is the closure on the top of the bottle. If the label were placed on the side of the bottle it would be impossible to recycle the bottle for milk use because of problems with washing and disinfecting the bottle after each use. The comments stated that the returnable glass bottle is important for the environment, and that many of their customers purchase it for that reason. They suggested the nutrition labeling for milk in returnable glass bottles be placed on placards at the point of purchase.

Other comments requested special allowances for uniquely shaped package containers (such as containers of honey in the shape of a bear, individual juice containers in the shape of a hand grenade, or cheese balls) or packaging materials that do not allow for fine printing (e.g., styrofoam ice cream cups).

FDA is willing to consider allowing the required nutrition information for returnable glass milk bottles to be available in labeling, as provided for in § 101.9(a)(2). As discussed in comment 223 of this document, § 101.9(g)(9) of this final rule allows that when it is not technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of nutrition labeling, FDA may permit alternative means of compliance or additional exemptions to deal with the situation.

4. Foods Purchased Under Government Contract

234. One trade association and one manufacturer requested exemptions for products produced for Government contracts (e.g., the National School Lunch Program, military feeding operations), using the reasoning that any products sold would be offered to the final consumer as part of a total meal/diet, and nutrition information on the meal must be supplied by the facility offering the meal.

FDA advises that products of the type discussed in the comment that are sold for use in restaurants and institutional food service operations are exempt under § 101.9(j)(2)(iii). As long as it is not reasonably possible that they will be sold directly to consumers, they need not be nutrition labeled. Therefore, no further exemption is necessary.

VII. Other Issues

A. Assortments of Food

235. A few comments requested clarification on whether assortments of foods, such as a box of assorted chocolates or nuts, would have to bear nutrient information on each type of chocolate (or nuts), or whether an average nutrient value would suffice.

The agency advises that in the preamble to the mandatory nutrition labeling proposal (55 FR 29487 at 29505), it stated that "where assortments of food are packaged, firms will be required to express nutrient content based on the package as a whole (e.g., the entire product contents may be combined for a nutrient analysis)." FDA recognizes that the terms "will be required" and "may be combined" appear inconsistent. Therefore, to clarify the regulation and in accordance with the agency's intent to offer flexibility in the labeling of assortments of foods, FDA has modified § 101.9(e)(1), recodified as § 101.9(h)(1), by deleting "of the total product" and adding a new sentence that states that when

separately packaged ingredients or assortments of the same type of foods are intended to be eaten at the same time, the nutrition information may be specified for each component or as a composite value. In developing a composite nutrient value, the entire product contents would be combined for a nutrient analysis.

In addition, to clarify the term "assortments of food" FDA has modified § 101.9(h)(1) by adding "assortments of the same type of food" and including the example of assorted nuts.

236. A few comments addressed the labeling of variety packs containing an assortment of individually packaged products (e.g., assorted ready-to-eat breakfast cereals or snack foods such as corn chips, cheese puffs, and potato chips). A food manufacturer marketing variety packages stated that they currently label each of the single-serving packages placed in a multi-serving container separately. The comment stated that the outer wrapping is generally transparent, making extensive labeling on the outer wrapping infeasible. Another comment suggested that the outer label contain the statement "Individual inner units carry nutrition information" where each of the single-serving packages in the variety pack bears nutrition labeling. The comment also stated that larger sizes of the individual packages of foods in the variety pack are invariably available to consumers at the same location, and the nutrition labels on those larger packages may be reviewed if desired.

FDA points out that a primary purpose of the 1990 amendments is to allow consumers to maintain healthy dietary practices. To do this, consumers must have access to nutrition information at the point of purchase. In many situations, consumers can look at the nutrition labels of larger packages of the individual foods for nutrition information. However, the agency does not agree that it is always possible to do so.

With respect to the transparent nature of the outer wrapping, FDA does not believe this makes labeling on that wrapping infeasible. Many bakery products are packaged in transparent wrappers and these products provide nutrition and other label information.

Inasmuch as many variety packs are currently printing the required nutrition information for each of the products contained in the variety pack in a table on the outer package, and because the outer packages are generally large, the agency concludes that a special allowance is not required for variety packs. Accordingly, FDA rejects the suggestion that the outer label merely state that the individual units within the package provide nutrition information.

However, the agency has no objection to manufacturers labeling only the individual inner packages if the information is provided in such a way that consumers can clearly see it at the time of purchase. Examples of this type of packaging can be found currently in the marketplace where nutrition labeling is provided on the tops of single-serving packages of breakfast cereals. Accordingly, FDA is adding a new paragraph § 101.9(h)(2) to specify that nutrition labeling of single-serving packages within variety packs must be clearly visible at the point of purchase. Proposed § 101.9(e)(2) is redesignated as § 101.9(h)(4).

237. FDA received comments from companies that sell food products by mail order, particularly varieties of foods and food assortments that are marketed as gifts. The comments requested special provisions in the regulations to provide some flexibility for packaged gift assortments because these packages are assembled from several thousand separately labeled food items, many of which are similar, differing only in size or flavor, and which are used in many different assortments. Because of the unique characteristics of the mail order gift food industry, caused, in part, by rapidly changing selections of gift packages offered, the comments contended that nutrition labeling would have a devastating effect on the industry, unless alternative means of compliance are allowed.

The comments requested that a new paragraph be added under proposed § 101.9(e) for assortments of foods intended to be used as gifts, allowing for nutrition information on such foods to: (1) Be included on labeling, (2) be based on uniform serving sizes, (3) omit reference to "servings per container," (4) be calculated as averages for categories of foods having similar dietary uses or similar significant nutritional characteristics for characterizing nutrients, (5) be based on calculations from nutrient data bases, and (6) omit foods meeting the definition of "small package" in § 101.9(j)(13) from determinations of nutrient content. A subsequent comment on behalf of the mail order gift food companies modified the last provision to state that foods in small packages only be omitted if they are not listed in promotional catalogues and are "optical garnishes" used to enhance the appearance of the gift package, or bonus items included as a free gift or promotional item.

FDA is persuaded that special allowances are justified for gift packages containing a variety of foods (e.g., cheese, jams, and crackers packed together in one gift box) or of food assortments (e.g., several different types of jam in one box). Accordingly, the agency is adding a new paragraph § 101.9(h)(3) to address gift packages.

New § 101.9(h)(3)(i) allows the required nutrition information to appear on the label or in labeling that is within or attached to the outer gift package. This provision allows the information to be consolidated in a single document that could accompany several different gift food packages that contain the same assortment of foods, although not necessarily in consistent size packages, as are identified in the document. This action is in recognition of the fact that the person who buys the gift package is generally not the person who will use the information. According to the comments, on average, 65 percent of company sales are shipped to recipients other than the purchaser. Moreover, many packages shipped to purchasers are subsequently offered as gifts to other persons.

The "outer package" is intended to mean the container directly within which component items are packed. It does not mean the shipping carton, unless component items are packed directly within the shipping carton instead of being packed in a separate inner container.

Comments also have persuaded the agency that standardizing the serving sizes for foods included in gift packages will simplify the simultaneous presentation of information on a variety of different types of foods by putting the information for all products on a comparable weight basis and, thereby, increase the likelihood that consumers will use and understand the information. The comments requested that, where there is no uniform household measure that is either a common multiple or fraction of the quantity of an individual food in an assortment, one ounce (fluid or solid as appropriate) be used as the standard serving size. Rather than leaving open the possibility of the use of any "uniform household measure," however, FDA believes that an allowable exemption from the serving size requirements would be permissible only when all of the foods in a particular gift package are not subject to the same reference amount customarily consumed, as specified in § 101.12(b).

FDA has no objection to the suggestion of a one ounce serving size

for solid foods in such circumstances. The selection of one ounce is acceptable based on the fact that it is the simplest value for use in calculations, many of the foods are packaged in multiples of one ounce, and it is the same as the reference amounts customarily consumed for many of the types of foods used in gift packages (e.g., many cheeses, crackers, and nuts) specified in § 101.12 in the companion document on serving sizes published elsewhere in this issue of the **Federal Register**.

In the case of liquids, the agency believes a larger serving size is needed because of the extra weight of water, and because there are no reference amounts specified in § 101.12 for liquids at only one fluid ounce. Based on the reference amounts in § 101.12, FDA believes a serving size of 2 fluid ounces is more appropriate for nonbeverage liquids such as syrups, and 8 fluid ounces is appropriate for beverages. These are the reference amounts in § 101.12(b) for maple syrup and for all beverages, respectively. The agency does not believe that it is reasonable to collapse the number of categories of foods any further than these three groups for the purpose of nutrition labeling of gift packages. Therefore, in response to the comments and in an effort to minimize the number of different serving sizes required in the nutrition labeling of gift packages, § 101.9(h)(3)(ii) allows for a serving size of 1 ounce for all solid foods, 2 fluid ounces for nonbeverage liquids, and 8 fluid ounces for beverages where there is no uniform reference amount customarily consumed for each individual food used in an assortment or variety of foods within a gift package.

However, the agency believes it would be misleading to allow nutrient content or health claims based on these serving sizes for foods packaged in gift packs where they differ from reference amounts specified in § 101.12(b) that are used as criteria for the claims. Therefore, § 101.9(h)(3)(ii) states that the reference amounts customarily consumed that are listed in § 101.12 must continue to be used for purposes of evaluating whether individual foods in a gift package qualify for nutrient content claims or health claims.

Inasmuch as section 403(q)(1)(B) of the act requires that the number of servings per container be included on the nutrition label, FDA does not believe that it has the authority to permit this information to be deleted. However in § 101.9(h)(3)(iii), FDA is allowing for the number of servings per container to be stated in the nutrition label as "varied" in recognition of the fact that each type of gift package will furnish a different number of servings. This action is consistent with § 101.9(b)(8) in the companion document on serving size published elsewhere in this issue of the **Federal Register**, which allows a manufacturer to declare "varied" for the number of servings per container for random weight products. The assembling of gift packs has a random quality. FDA is persuaded that requiring more specific information on labeling would necessitate a unique label or labeling for each package, negating the usefulness of these special provisions.

Section 101.9(h)(3)(iv) provides that average, composite nutrient values may be declared in nutrition labeling for reasonable categories of foods having similar dietary uses and similar significant nutritional characteristics. While the comments requested that composite values be allowed for reasonable categories of foods having similar dietary uses or similar significant nutritional characteristics, FDA believes that both criteria are necessary. Many forms of cheese and peanut butter have similar dietary uses in that they are used to make sandwiches or are eaten on crackers, yet they have far different nutritional characteristics and should not be composited.

The comments suggested, and FDA concurs, that companies should submit to FDA their determinations of "reasonable categories" for review and acceptance. FDA's decision on the companies' determinations will be based, in large part, on whether the values of the characterizing nutrients for foods in the category meet the compliance criteria set forth in § 101.9(g)(3) through (g)(6). To that end, companies should also submit a list of proposed characterizing nutrients for each "reasonable category" of foods.

For example, assuming total calories, total fat, saturated fat, and cholesterol are the categorizing nutrients for a group of cheeses, each cheese's content of these 4 nutrients would have to be no greater than 20 percent in excess of the declared values in the nutrition label, in accordance with § 101.9(g)(5), or reasonably less than the declared values, in accordance with § 101.9(g)(6). Nutrients other than the characterizing nutrients could be stated as an average, or composite, for the category, without having to meet the standards of § 101.9(g)(3) through (g)(6).

While the comments requested that FDA specifically permit the use of data bases for calculating the nutrition information for foods in gift packages, the agency does not believe a separate policy from that which the agency is establishing for other packaged foods (see section VII.B.2. of this document) is necessary or appropriate.

Section 101.9(h)(3)(v) allows foods that meet the definition for small packages under § 101.9(j)(13)(i) that are included in a gift package to be omitted in determining the nutrition information if they are not specifically listed in a promotional catalogue, and they are used in small quantities as "optical garnishes" to enhance the appearance of the gift package or are included as a free gift or promotional item. According to the comment, these items are used in very small quantities and may vary greatly from package to package. On the understanding that the "optical garnishes" are generally small plain candies wrapped in bright colored paper, the agency believes that the small amount used will make an insignificant nutrient contribution to the total package. Free gifts or promotional items, by definition, are not "offered for sale" and are therefore exempt under § 101.9(a).

B. Compliance (§ 101.9(g))

1. Compliance Procedures

In discussing the agency's rationale for requiring a single nutrient value on the label in lieu of permitting ranges of values, FDA tentatively concluded that its current compliance policy with respect to nutrient variability satisfied the requirements of the 1990 amendments (56 FR 60366 at 60373).

The compliance policy in current § 101.9(e) (proposed § 101.9(g)) requires that the nutrient content of the composite of 12 subsamples be at least equal to the labeled value for Class I nutrients (i.e., added nutrients in fortified and fabricated foods) and at least 80 percent of the labeled value for Class II nutrients (naturally occurring or indigenous nutrients). Proposed § 101.9(g)(4) specified that these requirements are applicable for vitamins, minerals, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, and potassium content. Likewise, in proposed § 101.9(g)(5), the nutrient content of the composite is required to be no more than 20 percent above the labeled value for calories, sugars, total fat, saturated fat, cholesterol, and sodium.

238. The agency received a number of comments regarding its compliance policy as stated in proposed in § 101.9(g) (56 FR 60366 at 60391). A few comments agreed with allowing an 80 to 120 percent leeway in the compliance of foods. One comment noted that while the nutrient values may not be absolute,

they are more consistent for the consumer. Also, the present system makes it easier for manufacturers to obtain compliance. However, the majority of comments disagreed with FDA's compliance policy, requesting that either a tighter or looser standard be used.

Consumers were strongly opposed to the so-called "80-120 rule." They felt the range was too lenient and stated that they would like to see a tighter standard adopted, especially for calories. Fat, carbohydrate, and cholesterol were also identified as nutrients that should have very accurate or exact label declarations. Some suggested other limits of acceptance, such as a plus or minus 5 to 10 percent range. Several comments supported a more accurate declaration of nutrients in consideration of the needs of persons with medical conditions requiring adherence to specialized or restricted diets. Other consumers considered the 20 percent margin of error as being inaccurate and misleading. Some comments considered that with today's available technology, food manufacturers could and should more accurately declare nutrients, notably calories, on the labels and meet more stringent standards.

Several comments included suggestions as how to better declare nutrient content on the label. Suggestions included the declaration of a tolerance standard on all product labels and an example of what the tolerance could mean. For example, the label of a product having a 10 percent tolerance for calories would state the declaration as "100 calories--could be 90 or 110 calories." One comment suggested that a statement be required adjacent to the calorie value declaring that it is "only an approximate figure." Another suggested that all food labels carry a warning of the 20 percent margin of error permitted for calories.

Comments from industry and trade associations considered the 80/120 percent range unduly restrictive. They supported more flexible compliance standards that would provide "representative values" of a product's nutrient content. Representative data in one comment was defined as the mean or the mean plus or minus one standard deviation. Their contention was that, because of the natural variation of foods, application of FDA's compliance procedures result in gross under-representation of some nutrients, such as vitamin A in carrots, and gross over-representation of other nutrients, such as sodium in soft drinks (because of variability in water sources). The comments took exception to FDA's assertion in the discussion on fresh produce and seafood, in the mandatory nutrition labeling proposal (55 FR 29487 at 29506) that nutrient content can largely be controlled in most manufactured foods. In fact, they stated there is greater variability in processed foods because of the complexity of prepared foods, the further processing that is required, the need to total the variability for each ingredient for prepared foods, the flexibility needed for obtaining ingredients from various sources or suppliers, and the analytical variability for required nutrients. One comment recommended that an 80 to 120 percent compliance range be used for nutrients with a low degree of natural or analytical variability. For nutrients with a high degree of natural or analytical variability, a less stringent 65 to 135 percent compliance range was suggested.

Another comment endorsed a more flexible compliance standard whereby micronutrient levels need only be present at a minimum level of 80 percent of declared levels. They recommended that no maximum compliance level be set. This comment was particularly in reference to the difficulty of achieving compliance for a product that has a standard of identity, such as pasta, where maximum and minimum levels of enrichment are specified by the standard. The comment stated that levels of added nutrients may vary depending upon the method of enrichment, indigenous nutrient levels in the wheat, analytical error, rounding of values declared on the label, and loss of nutrients during the drying process.

The agency disagrees with establishing more stringent requirements for label values. FDA shares concerns about individuals with very specific health problems where diets must be closely monitored and controlled. However, no data have been presented, and FDA is not aware of any such data, to suggest that health problems have been created because of the allowable variances. Therefore, the agency considers health management under professional guidance satisfactory using the nutrient values on the labels based on current regulations. In addition, it should be noted that the natural variability of foods may lead to both under- and over-reporting within the allowable variances for individual foods. These variances will tend to balance out over the entire day's diet.

While it is highly desirable to have a precise nutrient value on the label, it is impractical. The natural variability of a food is dependent upon a number of factors. Among them are the season of the year, soil type, variety (cultivar), and weather conditions. The processing that a food undergoes also alters its nutrient content. In addition to these variables, the agency places restrictions on the label declarations in regard to the rounding of nutrient values. These rounding rules are to avoid the impression of unwarranted accuracy as well as to make a label easier for a consumer to review and understand. To declare nutrient values more accurately or precisely than is presently required would place an onerous burden on the manufacturer. The costs associated with the excessive controls to provide more exact label declarations are unreasonable and would not be commensurate with any possible additional health benefit.

The agency rejects the suggestions that declared values be qualified by statements that they reflect tolerance levels or margins of error. Such statements on the label informing consumers of the possible variation between labeled and analytical values would cause great confusion with no real benefit.

Similarly, FDA disagrees with the comments that suggested establishing less stringent requirements for determining compliance with declared label values. As seen in comments, consumers rely on the declared values, and the accuracy of those values is important. FDA does not believe larger suggested ranges, such as 65 to 135, would give consumers the information that they need to adequately evaluate their nutrition intake. Therefore, the agency is not making requested changes in § 101.9(g).

FDA advises that it has not set maximum compliance levels in § 101.9(g) for Class I and Class II nutrients, nor has it set minimum compliance levels for nutrients specified in § 101.9(g)(5) (i.e., calories, sugars, total fat, saturated fat, cholesterol, and sodium). The 20 percent variability permitted is not a range but rather a lower or upper limit, depending on the nutrient. The only regulatory limit on overages of Class I and II nutrients is given in § 101.9(g)(6), which states that "reasonable excesses" are acceptable within current good manufacturing practice. Likewise, § 101.9(g)(6) also states that "reasonable deficiencies" of calories, sugars, total fat, saturated fat, cholesterol, and sodium under labeled amounts are acceptable within current good manufacturing practice. FDA anticipates that manufacturers will be diligent in their own behalf in not underdeclaring Class I and II nutrients, such as vitamins and minerals, and in not overdeclaring nutrients such as calories and fat.

Regarding maximum levels of micronutrients in standardized enriched pasta products, regulatory relief cannot be achieved through modifications of § 101.9 but require changes in the standards of identity of such products.

239. Several comments suggested that the 80 and 120 percent criteria should only be a guideline or screening tool. A few comments expressed the position that FDA should not declare a product misbranded until the manufacturer has had an opportunity to establish that the variations are reasonable under the circumstances.

Other comments suggested that the 80 and 120 percent criteria be waived when there are small quantities. (The quantity limits suggested were 10 and 20 or fewer "units." "Units" were interpreted to be units of measurements, such as 10 or 20 calories or 10 or 20 mg of sodium.) The comments noted that small numbers combined with rounding rules and analytical variability result in inequities for label compliance (i.e., the analytical variance for some low levels of nutrients is greater than the allowed regulatory variance). For example, the comment stated that if a mean value of 1.3 units was rounded for label declaration to the nearest whole unit (i.e., 1 unit), then the acceptable range would be 0.8 to 1.2 units when applying the 80 and 120 percent criteria. The range would be below the true mean value which could result in many products being found out of compliance. Furthermore, these small differences of 0.2 units may not be within the accuracy of many methods, so that the analytical variance could be greater than the allowed regulatory variance. For these small quantities of 20 or fewer units, the comments recommended that a 50 to 150 percent rule be applied. One comment recommended that FDA clarify in the final rule that the rounding of nutrient values, as required by the proposal, would not disadvantage a manufacturer when making nutrient content claims to meet compliance criteria as well as standards of identity.

An alternative suggestion in another comment to avoid an extreme over- or under-declaration when the value is small is to declare the nutrient content to the nearest whole unit with compliance based on a fixed percentage (e.g., within 80 percent) or a fixed unit amount (e.g., one unit or 2 percent U.S. RDA, the basic increment of rounding). The regulation would then require that declared amounts be within 80 percent or one unit (such as a g) for Class II nutrients or within 120 percent or one unit for nutrients such as calories, fat, or sodium.

The agency is not persuaded that the current or proposed acceptance criteria for compliance evaluation should be changed. The compliance criteria permit reasonable excesses over labeled amounts or deficiencies under labeled amounts, dependent upon the nutrient being evaluated, (current § 101.9(e)(6), redesignated as § 101.9(g)(6)) within current good manufacturing practices. As discussed in section IV.A. of this document, the level of "reasonable" is not specified.

It is the manufacturer's responsibility to target labeled values to correspond to actual nutrient levels so that products will meet compliance requirements. This responsibility includes taking into consideration the effects of rounding. Any effect caused by the rounding of labeled values to meet the agency's requirements in § 101.9(c) should be accounted for by the manufacturer in developing a label value and would be included in the evaluation of a "reasonable" level by the agency. Analytical variance is also one of the factors in determining compliance acceptance. This fact is stated in § 101.9(g) (4) and (5) in this final rule.

Manufacturers should perform shelf-life stability studies to substantiate the declared nutrient levels of the product and to demonstrate that a product can meet label claims over the shelf life of the product. FDA does not believe that incorporation into the regulations of any additional explicit provision or compliance position for low level nutrients or small labeling increments would provide added protection for manufacturers.

240. One comment strongly recommended that FDA address sampling issues. It suggested that the current procedure in § 101.9(e)(2) (and in proposed § 101.9(g)(2)) of preparing a composite of 12 subsamples taken from a single lot be changed. Instead, it was suggested that a sample composite for analysis represent 12 different lots.

The agency disagrees with the suggested change in sampling procedures. The comment's suggestion reflects a sampling objective that appears to focus on estimating the nutrient content of product for a specified quantity (e.g., a company's production). FDA's sampling objective is to determine whether the average, within a given lot (a quantity that is defined in current § 101.9(e)(1)), meets label claims. From a compliance evaluation standpoint, the suggested sampling scheme is not a feasible alternative because the results obtained would not be traceable to a specific lot should an overage or deficiency be encountered. Instead of a compliance action against a smaller quantity (a single lot), it might be necessary to take a compliance action against a larger quantity (e.g., a company's production for a larger specified point in time). Therefore, FDA is making no change in § 101.9(g)(2) in response to this comment.

241. Several comments that disagreed with the agency's compliance policy provided suggestions to clarify the codified language. One comment recommended the elimination of total carbohydrate, complex carbohydrate, and unsaturated fat from the Class I category of nutrients at § 101.9(g)(4)(i). It maintained that these three nutrients are unlikely to be "added" but are the result of having used ingredients that inherently have these nutrients.

FDA agrees with the recommendation Therefore, the agency is amending § 101.9(g)(4)(i) to delete total carbohydrate, complex carbohydrate, and unsaturated fat from the Class I category. This deletion should allay the concerns of having the cited nutrients meet Class I nutrition labeling requirements. These nutrients remain in the Class II category (§ 101.9(g)(4)(ii)), although in accordance with the changes made in section III. of this document, complex carbohydrate is changed to other carbohydrate and unsaturated fat to poly- and monounsaturated fat.

To clarify the compliance policy concerning variability because of analytical methodology for Class I and Class II nutrients, FDA is modifying § 101.9(g)(4) by making a new paragraph out of the last sentence which begins with the word "Provided." This change should make clear that the proviso information regarding consideration of regulatory action is applicable to both Class I and Class II nutrients. This qualifying information was inadvertently moved under the paragraph on Class II nutrients in the July 19, 1990 mandatory nutrition labeling proposal, and the error was carried forward in the supplementary proposal.

242. One comment stated that manufacturers should be able to use mean values in all cases, except that statistical outliers should be ignored. The comment also urged the agency to codify its compliance policy to the extent that if a nutrient is found out of the 80 to 120 range of the labeled amount, the product would not be deemed out of compliance as long as the manufacturer can demonstrate that the label declarations represent mean values based on reasonable and adequate sampling and analyses.

FDA disagrees with the comment. The agency's position on the use of mean values is summarized in the preamble of the supplementary proposal (56 FR 60366 at 60373). This position is discussed in more detail in the "FDA Nutrition Labeling Manual: A Guide for Developing and Using Databases" and in section VII.B. of this document. In short, FDA will allow the use of mean values derived from satisfactory data bases if the coefficient of variation is equal to or less than the maximum coefficient of variation specified in the above manual. The coefficient of variation is the standard of deviation (a measure of variability) expressed as a percentage of the mean.

243. A recommendation was made in one comment to amend § 101.9(g)(5) by adding: "Provided, that no regulatory action will be based on a determination of a nutrient value which falls above this level by a factor less than the variability generally recognized for the analytical method used in that product at the level involved." The comment noted this addition would extend the allowance for analytical variability permitted for vitamins, minerals, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, and potassium, as given in proposed § 101.9(g)(4) to the nutrient declarations for calories, sugars, total fat, saturated fat, cholesterol, and sodium.

The agency agrees that analytical variance is a valid consideration when contemplating regulatory action for all nutrients. Accordingly, the proviso stated in § 101.9(g)(4), which is applicable for Class I and Class II nutrients, is added to § 101.9(g)(5).

244. One comment recommended a two-stage enforcement procedure. The first stage would involve analysis of a single 12-sample composite to determine whether the product passes the compliance standard of 80 to 120. If it passed, the agency would have no enforcement issue. If it did not pass, the agency would collect and measure the nutrient content in three other lots. The average of all four lots tested would be evaluated for compliance purposes.

The agency is not making the change in its procedures that was suggested by this comment. As recognized in several comments from manufacturers, it is the manufacturer's responsibility to accurately declare the nutrient content of a product. As discussed above, the interpretation of results obtained from more than one lot (same ingredients, same processing conditions) cannot be translated to other lots. Factors that could have altered the nutrient content of one lot may not be present for subsequent lots. Through quality control programs and careful consideration of declared nutrient amounts according to the guidelines in "FDA Nutrition Labeling Manual: A Guide for Developing and Using Databases," manufacturers can help to ensure that each lot meets compliance standards. The suggestion made in this comment or in comment 240 of this document in regard to evaluating results representing the analysis of a composite from 12 different lots or an average of results from four composites could be implemented in a manufacturer's quality control procedures to assure compliance with § 101.9(g).

It should be noted that the analyzed nutrient content is not the sole factor in determining whether the agency will bring a particular enforcement action. Other factors that it considers include the effect of matrix upon the analyte, the level of the analyte in the food, information obtained during an establishment inspection of a firm, consumer complaints, past compliance history of the firm, and the firm's demonstrated ability to adequately perform the analysis for a nutrient.

245. A comment recommended that a new section be added to the codified language to the effect that "The metric declaration of the serving size shall be used to determine compliance under this section." The comment said that this change would eliminate any confusion about which of the dual declarations required for serving size would be the determining factor for nutrient declaration.

FDA agrees with the comment. In its serving size proposal (56 FR 60394 at 60410), the agency stated that in addition to the more approximate household measure, it needed a precise weight statement for serving size for compliance purposes. Accordingly, the agency proposed in § 101.9(b)(7) that the serving size in common household measures must be followed by the equivalent metric quantity. However, FDA did not specifically state that this metric measure would be used for compliance purposes. Therefore, for purposes of clarity, the agency is adding a new section, § 101.9(g)(7), to correct this oversight. Consequently, the remaining paragraphs in § 101.9(g) are redesignated.

246. One comment expressed concern that net weight regulations must be considered when evaluating a product against the 80 to 120 rule for compliance. The comment stated that manufacturers are required to sell products at levels above the declared label weight. The comment concluded that this resulted in a discrepancy between labeled nutrition information and actual nutrition values.

The agency does not consider this issue to be a valid concern. Because of the economic considerations of manufacturing, most products are close to label claims for net weight. Additionally, while an overage or underage of the net weight may slightly alter the nutrient content of the container (and particularly if the container is a single serving size), the serving size is the factor by which the nutrients are evaluated. As discussed in the preceding comment, FDA will composite samples and then use the metric weight declared as the label serving size to evaluate the accuracy of declared nutrient values.

2. Data Bases

247. FDA received a large number of comments regarding the use of data bases as sources of nutrient information for nutrition labeling. Most comments supported the use of data bases, giving as reasons that the use of data bases would reduce costs to industry (especially to small businesses), moderate food cost increases to be passed on to consumers, promote fair competition, save time, reduce the use of laboratory chemicals, provide sufficient accuracy, and ease compliance verification procedures. Comments requested the opportunity to use nutrient composition data in commercially available or published data bases directly or through calculation of ingredient values to yield the final composition of formulated products.

FDA appreciates the important role data bases can play in nutrition labeling. Industry-wide data bases were first suggested in 1979 as a possible means of reducing the cost of developing nutrition labeling for individual companies. FDA, USDA, and the Federal Trade Commission encouraged this concept in a notice of proposed rulemaking published in the **Federal Register** of December 21, 1979 (44 FR 75990) describing the agencies' policies and intentions with respect to numerous food labeling issues. In that notice, FDA, while not agreeing to approve data bases, stated that it would work with industry to resolve any compliance problems that might arise for food labeled on the basis of a data base that the agency had accepted.

FDA is concerned about the reliability of data bases to meet compliance requirements for nutrition labeling. Nutrient data may be valid for some purposes and not for others. For example, data bases that were developed largely for determining

average daily dietary intakes generally serve that purpose well. However, such data bases are usually not adequate to determine natural variability of a particular food or to develop labeling values that are in compliance with FDA nutrition labeling regulations.

Despite these concerns, FDA continues to acknowledge the potential usefulness of data bases to reduce costs associated with nutrition labeling. The agency set out its general policy on the use of data bases most recently in the proposed and final rules on the voluntary nutrition labeling program for raw produce and fish (56 FR 30468 at 30474, July 2, 1991 and 56 FR 60880 at 60884, November 27, 1991, respectively) and the supplementary nutrition labeling proposal (56 FR 60366 at 60373). In addition, the agency announced in the **Federal Register** of July 23, 1992 (57 FR 32796) the availability of a draft manual entitled "FDA Nutrition Labeling Manual: A Guide for Developing and Using Databases." The manual, which replaces the former guide "Compliance Procedures for Nutrition Labeling," is intended to aid companies and trade organizations in developing and using a data base for nutrition labeling that would meet the regulations proposed as a result of the 1990 amendments. It also discusses the conditions under which the mean value derived from a satisfactory data base may be used for nutrition labeling. Comments were requested on the draft manual. These comments have been considered, and the agency is hereby announcing the availability of the final manual. The manual may be obtained from the Division of Nutrition (HFF–260), Office of Nutrition and Food Sciences, Center for Food Safety and Applied Nutrition, Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

FDA anticipates that this manual will be of assistance in identifying a data base that is of a quality to provide an adequate basis for nutrition labeling. The use of such a data base to calculate the final composition of a product formulated from several ingredients presents additional problems, however, in that there are no allowances or determinations of the loss of nutrients that may occur during further processing. Depending on the type and amount of processing, significant amounts of nutrients may be lost. The agency is willing to work with manufacturers and trade associations to determine if successful models can be developed showing the relationship between ingredient composition and final product composition that account for losses during processing. While extensive analyses of ingredients and final products would be required to develop and validate a successful model, such action could lead to an acceptable data base.

If a manufacturer wishes to use a data base for nutrition labeling, it is advantageous to follow the statistical procedures outlined in the manual and have the data base accepted by FDA. If the agency finds that the nutrition label of a product which is based on a data base that has been accepted by FDA is not in compliance with § 101.9, FDA will not take immediate action against the product, provided that the company has followed good manufacturing practices in producing the food. Instead, the agency would work with the manufacturer to resolve the compliance issue. Action would be taken only if noncompliance was the result of failure to follow good manufacturing practices.

It must be noted that submission of a data base to FDA for review and acceptance is voluntary. The agency has not prescribed how an individual company is to determine nutrient content for labeling purposes. The choice of a data source is the prerogative of the manufacturer. The manufacturer needs to be judicious in this selection, however, to ensure that the product labeling is in compliance with the regulations. The compliance policy of the agency remains unchanged from current § 101.9(e). An FDA investigator/inspector will collect random units of food (e.g., consumer packages, items of product) from each of 12 different randomly chosen shipping cases of the same code/lot, and an FDA laboratory will prepare a single composite from the 12 units of food. Analysis of the composite will be performed using methods of the AOAC or other reliable and appropriate methods. FDA will then compare the values declared in the nutrition label and labeling with the results from the laboratory analyses. Section 101.9(g)(8) provides for the use of an approved data base.

248. Many comments were received expressing support for use of data bases because they can be used by a company one time, and there would be only a one time cost to determine the nutritional values for the label without regard to future changes in the product.

The agency is concerned that there is a misunderstanding regarding the use of data bases. Data bases are not static but dynamic because of changes in products. Those data bases submitted to the agency or used by companies are expected to reflect the nutritional content of products being offered for sale. Changes in variety, supplier, recipe, or manner of processing could lead to very different nutritional values for the product than those in the original data base. The agency, in monitoring products for compliance, will also review the maintenance of these data bases to ensure that the information in the data bases reflects the nutritional content of the products being offered for sale. Maintenance of a data base means that laboratory analyses of the product are done on a periodic basis to ensure that the nutritional values of the product are within the limits of the data base values. Proper maintenance of the data base is left to the originators of the data base. Frequency and type of maintenance are determined by the data base holders based on their knowledge of the changes in the products. Satisfactory data bases could be useful for periods of up to 10 years based on the size of the data base, plan for maintenance, and the complexity of the product. FDA reviews will be based on the amount of supplementation of the data bases with additional laboratory data (maintenance) during the period of use and the changes in the products covered by the data base.

3. "Nutrition Labeling Manual: A Guide for Developing and Using Data Bases"

FDA announced in the **Federal Register** (57 FR 32796) on July 23, 1992, the availability of a draft manual entitled "Nutrition Labeling Manual: A Guide for Developing and Using Data Bases" (the manual). This manual is intended to aid companies and trade organizations in developing and using a data base for nutrition labeling that meets the regulations resulting from the 1990 amendments. Comments on the manual were accepted until September 8, 1992. This manual provides generic instructions on how to develop and use a data base in preparing nutrition labeling for a food product. Eighteen comments were received from companies or trade associations. The following summarizes the comments and provides the agency response to those comments.

249. Almost all of the comments were opposed to the limit of 80 percent of the label claim for Class II (indigenous) nutrients and 120 percent for calories, sugars, total fat, saturated fat, cholesterol or sodium. The comments argued that these limits were overly restrictive and should be widened or average values should be used with no consideration of limits.

The use of 80 percent or 120 percent as limits for regulatory purposes is established in § 101.9(g) and has been addressed above in section VI. of this document. The manual was developed to aid in the calculation and

construction of data or data bases to meet the regulatory requirements of the agency. Should the agency change its regulations, it will reflect those changes in the manual. Until such changes are made, however, the manual must reflect the applicable regulatory limits.

250. All but one of the comments addressed the use of recipe data bases to calculate final composition of mixed products. The comments cited the savings in money to small businesses, the constant changes in recipes that make it too costly to do analytical testing of products, and the cost of analyzing a large number of products for which the volume is low. The expressed belief was that calculated values better represent the nutrient content over time. Several comments suggested criteria for a good recipe data base. One comment offered the following four proposed principles of good ingredient composition data bases:

(1) Confidence in the quality of data, supported by documentation of data sources. Companies maintaining or using ingredient composition data bases must be able to demonstrate the data source used for each type of product and each nutrient for which ingredient composition data bases are utilized.

(2) Proper maintenance of the data base. Companies developing or using ingredient composition data bases must have procedures in place to ensure that the values in the ingredient composition data bases are reviewed and updated as needed and on a regular basis.

(3) Specificity with respect to ingredients, product formulations, and processes. Companies using ingredient composition data bases must have procedures in place to ensure that the nutrient values are used only for specific applications. For example, a company should have a procedure to ensure that nutrient data specific for one product formulation or process are not used to prepare nutrient declarations for similar product formulations or processes, without assurance that the data are applicable to those products or processes.

(4) Validation of the data base. Companies developing or using ingredient composition databases must have procedures in place to ensure that nutrient values receive reviews, audits, and confirmation through nutrient analyses as often as necessary.

Other comments suggested that manufacturers should be required to substantiate any nutrient content or health claims with analytical data.

The agency agrees that the principles suggested by the comment are worthwhile and necessary for construction of a proper ingredient composition data base. This was the intent of the statement in the manual that calculation of the final composition of a mixed product using data bases of the nutrient composition of ingredients might be acceptable if properly modelled. The agency wanted to assure itself that the ingredient composition information was adequate, and that the calculation of the final nutrient value of the finished product reflected any possible loss of nutrients during processing. In addition, a successful mathematical model used for this purpose should be augmented over time with a review of its applicability by laboratory analysis of the nutrient content of both ingredients and final products. Models constructed with the features described above, and applied to a limited range of appropriate products, would receive serious consideration from the agency. The above features of an appropriate data base will be included in the manual.

The agency believes that in time the calculation of the final composition of mixed products from ingredient data bases may be acceptable for a range of food products. At this time, however, the agency believes that the data that make up ingredient data bases are of mixed quality and, therefore, of limited value. Companies that wish to use ingredient data bases must look at the individual analytical values of each ingredient to evaluate the data to assure themselves that the data are sufficient, meet the requirements expressed in the manual for representativeness, are valid from an analytical standard, and are sufficient to account for any variation in the ingredient.

The agency has stated that the company bears the final responsibility for the accuracy of the label. This principle has not changed and was repeated and supported by several of the comments.

251. Comments were received on changing various aspects of the agency's regulatory policy such as larger number of lots sampled and the average taken, composite samples consisting of several lots, exemption from compliance procedures when data bases are used regardless of whether the agency has accepted them or not, exemption from compliance procedures for nutrients that have a low concentration, and exemption from compliance procedures for companies/associations that have submitted basic data and a plan for data base development over time.

The manual is intended to aid manufacturers/associations in meeting the compliance regulations of the agency. The manual does not set compliance policy but rather offers some explanation for the compliance policy and provide different means of complying with the nutrition labeling regulations. Should the compliance policy of the agency change, the manual will also be changed to reflect those changes.

252. Many comments were received regarding the confidentiality of the submitted data bases. Developers of data bases did not want to see the information gained through analyses of products and ingredients released through freedom of information requests or used in unacceptable ways or for inappropriate products. In addition, development of data bases is a program with costs shared among the participating companies. The comments sought assurance that the data would not be available at no cost to companies that did not participate in its development. Formulations that are used to produce mixed products are also regarded as confidential company information, and the comments sought assurance that they would not be available to anyone who requests the information.

The agency is aware that the development of a data base is costly, and that it may contain information that is of a confidential nature. The agency agrees that release of a data base could vitiate substantial proprietary interests in valuable documents submitted to the agency. Furthermore, it has never been the agency's intent, nor does it have the resources, to maintain and manage data bases that are developed by manufacturers or associations. The agency believes that the availability of a data base is therefore the primary responsibility of the developer. The agency will continue with the policy of assisting the developers of data bases, providing guidance to those who ask for it, and accepting adequate data bases for the products submitted for review. Only those data sufficient to support the agency's decision to accept or not accept a data base will be retained. Confidentiality of such data will be determined and maintained in accord with regulations in part 20 (21 CFR part 20).

Those data base developers who choose to do so are encouraged to make their information available through such compilations as the USDA Handbook No. 8 so that all may benefit from the additional analytical information.

C. Proposed § 101.9(h)

253. A few comments objected to the requirement in proposed § 101.9(h) that nutrition information provided by manufacturers or distributors directly to professionals (e.g., physicians,

dietitians, educators) must contain or have attached to it the nutrition information exactly as required by § 101.9. The comments stated that it was inappropriate for a Federal agency to regulate the transfer of information in this manner.

FDA notes that this section of the regulation has been carried unchanged since 1973 (49 FR 6961, March 14, 1973). At that time, the agency stated that it did not want to restrict the flow of information from food manufacturers to professionals (such as more precise amounts rather than the increments used in nutrition labeling) but rather wanted nutrition information included or attached to it in the form it would be provided to consumers. Inasmuch as nutrition labeling is now mandatory, so that consumers will have the required information available to them on food product labels, FDA has decided to delete this requirement and is doing so in this final rule.

D. Section 101.9(k)

254. Many comments objected to proposed 21 CFR 101.9(k) which details types of nutrition-related claims that cause a food to be misbranded. Most of these comments asserted that the provisions of § 101.9(k) are contrary to the intent of the 1990 amendments and contrary to the will of Congress.

Many comments offered specific objection to proposed § 101.9(k) (3) and (4) and asserted that manufacturers should be allowed to provide information about the effects of soil, storage, transportation, or cooking on the nutrient content of foods. Some comments maintained that the restriction of such information is unconstitutional. A number of comments felt that labels should be required to provide information as to the exact identity of the contents (including substances of no nutritional value), the source of the contents, the amounts of all ingredients, and the techniques and dates of processing. One comment proposed that manufacturers should be required to put toll-free telephone numbers on all of their products so that consumers could call for information about those products.

Many comments asserted that proposed § 101.9(k)(5) is arbitrary and restrictive and expressed a belief that certain naturally-occurring food constituents will be rendered unavailable by this provision. A number of comments maintained that there is no legitimate reason for prohibiting substances found in nature from being incorporated into nutritional products and listed on the label. Some comments suggested amending proposed § 101.9(k) to allow the use of naturally-occurring constituents of foods and herbs, unless there is sufficient evidence that any specific such substance is harmful to human health.

Some comments also objected to proposed § 101.9(k)(6), maintaining that vitamins that are naturally present are better than added synthetic vitamins. These comments expressed a strong desire to know whether vitamins contained in any specific product are naturally-occurring or synthetic.

FDA regrets that its publication of § 101.9(k)(2) through (6) in the November 27, 1991 (56 FR 60393) proposal has created confusion. The publication of § 101.9(k)(2) through (k)(6) did not constitute a proposal of new regulations. It merely represented a proposed redesignation and republication of existing regulations for clarity and completeness.

The provisions embodied in current § 101.9(i)(2) through (i)(6), redesignated in the November 27, 1991, supplementary proposal as § 101.9(k)(2) through (k)(6), to which the comments directed their objections, were first proposed in the **Federal Register** of March 30, 1972 (37 FR 6493), and were promulgated and published in the **Federal Register** of January 19, 1973 (38 FR 2125), as § 1.17(i)(2) through (i)(6). Following an appropriate comment period, these regulations were modified and published as final regulations in the **Federal Register** of March 14, 1973 (38 FR 6961). The regulations were subsequently applied, with certain exemptions, to all food labeling ordered after December 31, 1973, and all labeling used for food products shipped in interstate commerce after June 30, 1975. In the reorganization and republication of section 21 of the Code of Federal Regulations that appeared in the **Federal Register** of March 15, 1977 (42 FR 14308), § 1.17(i) was renumbered as § 101.9(i). No changes were made to the original codified language of the subject paragraphs during any of these renumberings, and those regulations remain as adopted in 1973.

The only change in § 101.9(k) in the supplementary proposal was in the document entitled "Labeling; General Requirements for Health Claims for Food" (56 FR 60537, November 27, 1991). This document proposed to amend current § 101.9(i)(1), redesignated as § 101.9(k)(1), by adding a second sentence that reads "Information about the relationship of a dietary property to a disease or health-related condition may only be provided in conformance with the requirements of § 101.14 and subpart E of part 101." No comments voiced specific objection to this proposed change.

FDA notes that the provisions of current § 101.9(i) had long been in effect at the time Congress drafted the 1990 amendments. While Congress did enact provisions under the 1990 amendments that allow for health claims on foods, nothing in the act or in the legislative history of the act suggests that Congress intended that current § 101.9(i) should be changed. The agency therefore finds no basis for the assertion that the provisions of current § 101.9(i), redesignated as § 101.9(k), are now contrary to the intent of the 1990 amendments.

FDA has reconsidered the requirements of § 101.9(k)(5), however, in light of the comments. The agency concludes that there is no reason to prohibit safe substances from being incorporated into conventional foods or dietary supplements of vitamins and minerals as long as their presence is noted in the ingredient list, and the product's label or labeling does not state or imply that the food has special dietary properties because of the presence of the substance when, in fact, its usefulness has not been established. Section 411(b)(2) of the act provides that vitamin and mineral products may contain substances that are not vitamins or minerals as long as the substances are only identified as a part of the ingredient list. Therefore, proposed § 101.9(k)(5) is amended by deleting the second and third sentences.

Questions have been raised as to whether the amounts of these substances that are not vitamins or minerals can be included on the food label. Such information can be included in the ingredient list if, in addition to listing the ingredients in order of predominance by weight, quantitative information on each of the ingredients in the food is presented. However, information about the ingredients that are not vitamins and minerals may not be presented in a way that suggests that the dietary usefulness of these substances has been established.

While the comments raised objections to the other provisions of proposed § 101.9(k) (i.e., (k)(3), (k)(4) and (k)(6)), none provided arguments that convinced the agency that deletion or revision of those provisions was either appropriate or necessary in fulfilling the mandates of the 1990 amendments. The objections that were raised, however, suggest that a clarification of the intent of those provisions would prove helpful to those who voiced the objections. Such a clarification was provided in the **Federal Register** of March 14, 1973 (38 FR 6961). In that document, the agency

noted that § 1.17 (i)(3) and (i)(4) (redesignated as § 101.9(k)(3) and (k)(4)) are aimed at prohibiting unsubstantiated generalizations about nutrient losses because of soil, transportation, or processing and do not preclude a producer, manufacturer, or vendor from indicating a higher nutrient retention in a particular product as compared to other similar products. Nor do they preclude an indication that such retention results from special handling of the product, provided that such indications are factual. Further, these provisions do not preclude a manufacturer from suggesting cooking or handling methods that would result in optimum nutrient retention. While the agency recognizes that such information may be useful to consumers, it does not believe that it would be appropriate to require manufacturers to provide such information, either on the labeling or through other media.

Current § 101.9(i)(6), redesignated in the supplementary proposal as § 101.9(k)(6), prohibits any suggestion that a naturally-occurring vitamin is superior to an added vitamin. The agency finds no basis for such an assertion, and the comment offered no data in support of such an assertion. As the agency clarified in the repromulgation of March 14, 1973 (38 FR 6950 at 6958), this section (then § 1.17(i)(6)) "forbids any suggestion that a natural vitamin is superior to an added vitamin, but permits any truthful designation of any nutrient as natural in origin."

FDA acknowledges its inadvertent oversight in not including a reference to proposed § 101.36, Nutrition Labeling of Dietary Supplements of Vitamins and Minerals, in proposed § 101.9(k). The inclusion of this reference is a logical outgrowth of the agency's stated intention that "nutrition labeling of vitamin and mineral supplements appear as similar as possible to the nutrition labeling of other foods" (56 FR 60366 at 60382). Section 101.9(k) applies to all foods, including dietary supplements of vitamins and minerals, and the agency did not intend to narrow its scope. Therefore, FDA tentatively concluded that it should correct this oversight by including an appropriate cross reference to § 101.36 in the final rule. However, the agency will propose its position on this issue following the DS Act. For completeness, FDA is inserting the word "label" in the first paragraph of § 101.9(k) to clarify that this section pertains to food labels as well as labeling.

255. One comment asserted that the phrase "represents, suggests, or implies" in the opening sentence of § 101.9(k) is unconstitutionally vague.

FDA disagrees with the comment's assertion that the phrase "represents, suggests, or implies" is unconstitutionally vague. The agency notes that the vagueness doctrine is generally applied to strike down prohibitions on speech that leave individuals without clear guidance on the type of speech that is prohibited. See, e.g., *Village of Hoffman Estates* v. *Flipside, Hoffman Estates, Inc.*, 455 U.S. 489, 498-99 (1982); *Grayned* v. *City of Rockford*, 408 U.S. 104, 108 (1972). The provisions of § 101.9(k) are narrowly tailored and clearly delineate the types of statements about nutrients that will render a food misbranded. Thus, § 101.9(k) provides clear and precise guidance on the type of speech that is prohibited.

E. Conforming Amendments

256. A trade association wrote in support of the multiunit retail exemption in § 101.9(j)(15) and requested that § 1.24(a)(14) be amended to reflect the change by including a reference to section 403(q) and (r) of the act. The comment stated "we submit that this amendment is fully consistent with the requirements of the 1990 amendments and the provisions of the proposed § 101.9(j)(13) in that nutrition labeling will be provided on the outer carton together with the other information required under the referenced sections."

The agency agrees that § 1.24(a)(14) of the General Enforcement Regulations should be amended to reference 403(q) of the act, as amended by the 1990 amendments. This change merely conforms § 1.24(a)(14) to the rule that FDA is adopting in § 101.9(j)(15). Accordingly, the agency is amending § 1.24(a)(14) to read as follows: "The unit containers in a multiunit or multicomponent retail food package shall be exempt from regulations of section 403(e)(1), (g)(2), (i)(2), (k), and (q) of the act with respect to the requirements for label declaration of the name and place of business of the manufacturer, packer, or distributor; label declaration of ingredients; and nutrition information when * * *."

However, FDA cannot grant the comment's request with respect to section 403(r) of the act. Any container that bears a nutrient content claim or a health claim must comply fully with the requirements of that section of the act and of the regulations that implement it.

257. A food trade association requested that FDA amend § 101.100(d) to include section 403(q) and (r) of the act to provide that products shipped in bulk for further processing, labeling, or repacking in substantial quantities at an establishment other than where originally processed or packed, are exempt during the time of introduction into, and movement in, interstate commerce and during the time of holding in such establishment.

FDA agrees that § 101.100(d), Exemptions From Food Labeling Requirements, should be amended to include 403(q) of the act. Again, this modification merely reflects the rule that FDA is adopting in § 101.9(j)(9). However, for the reason explained in response to the previous comment, FDA is not granting the request with respect to section 403(r) of the act. Accordingly, FDA is amending 21 CFR § 101.100(d) to read as follows:

> Except as provided by paragraphs (e) and (f) of this section, a shipment or other delivery of food which is, in accordance with the practice of the trade, to be processed, labeled or repacked in substantial quantity at an establishment other than that where originally processed or packed, shall be exempt, during the time of introduction into and movement in interstate commerce and the time of holding in such establishment, from compliance with the labeling requirements of section 403 (c), (e), (g), (h), (i), (k), and (q) of the act if: * * *."

Nutrition Labeling of Dietary Supplements of Vitamins and Minerals

258. Most comments, including those from supplement manufacturers and trade associations, supported the general concept of nutrition labeling for dietary supplements of vitamins and minerals. One comment, however, suggested that any decisions on nutrition labeling of vitamin and mineral supplements be deferred until the agency decides how it intends to regulate dietary supplements, in general. This comment is referring to FDA's Task Force on Dietary Supplements. The comment argued that the proposed labeling requirement would create a label with large amounts of information that is of little value to the consumer, particularly for single vitamin and mineral supplements.

As pointed out in the supplementary proposal (56 FR 60366 at 60381), section 403(q)(5)(E) of the act states that if a food to which section 411 of the act applies (i.e., dietary supplements of vitamins and minerals) contains one or more of the nutrients required to be listed in nutrition labeling, "the label or labeling of such food shall comply with the requirements of paragraphs (1) and (2) [of section 403(q) of the act] in a manner which is appropriate for such food and which is specified in regulations of the Secretary." In the supplementary proposal (56 FR 60366 at

60381 through 60382), the agency also stated that vitamin and mineral supplements are required to bear nutrition labeling under section 403(q)(5)(C) of the act even if they do not contain any of the nutrients required to be in nutrition labeling. Section 403(q)(5)(C) of the act provides that nutrition labeling is not required in such circumstances unless a claim is made about the nutritional value of the food. The statement of identity for supplements of vitamins or minerals, including single vitamins or minerals, may be a claim about the nutritional value of the supplement. However, because the DS Act imposes a moratorium on the implementation of the 1990 amendments, FDA is not taking any action to implement section 403(q)(5)(c) of the act at this time.

FDA's Task Force on Dietary Supplements is consequently irrelevant to this issue. Nothing in the Task Force's report would relieve the agency of the obligation to adopt regulations to implement the explicit requirements of the law.

Furthermore, the agency does not agree that nutrition information for vitamin and mineral supplements is of little value to the consumer. These products are represented and sold for their vitamin and mineral content. Thus, nutrition information about them will assist consumers in determining the role that the products can play in maintaining healthy dietary practices. Moreover, the agency notes that most vitamin and mineral supplements already bear nutrition information on their labels.

For the reasons stated, the agency tentatively concluded that it is not necessary to modify its requirement for mandatory nutrition labeling on labels of dietary supplements of vitamins and minerals. However, the agency will propose its position on this issue based on the provisions of the DS Act.

259. In testimony at one of the public meetings held by FDA, there was a comment suggesting that small packages of dietary supplements of vitamins and minerals be exempt from mandatory nutrition labeling.

Section 403(q)(5)(B) of the act provides for an exemption for foods in small packages "if the label of such foods does not contain any nutrition information." This provision is implemented in § 101.9(j)(13)(i). Thus, the question is raised as to whether the statement of identity for supplements of vitamins and minerals is a claim. FDA will address this question and the implementation of section 403(q)(5)(B) with respect to dietary supplements in accordance with the terms of the DS Act.

260. One comment recommended deleting proposed § 101.36(b)(1) that required the number of units recommended per day to be declared in the nutrition label on the basis that it is repetitious of information that is on the label in other places.

Likewise, a few comments were opposed to proposed § 101.36(b)(2) that required declaration of "Units per container" in the nutrition label. These comments asserted that such a requirement is redundant and unnecessary because the number of units per container is already listed on the principal display panel of dietary supplements as part of the net contents declaration.

FDA considered these comments and agrees that, for supplements in which the unit is a discretely defined unit (e.g., tablets or capsules), "Units per day" could be confusing. The agency is concerned that consumers could be confused by a statement that indicates that several units are to be taken per day (e.g., 3 tablets per day) when the nutrient information is given for one unit. If consumers do not look at the column legend that states that the nutrient information is "per unit," they might assume that the nutrient information is for the amount specified for consumption per day. To avoid the possibility for confusion, FDA tentatively concludes that the subheading "Each unit contains:" should be allowed for supplements in which the unit is a discretely defined unit (e.g., tablets or capsules). Directions concerning the number of units to be consumed per day should be given outside of the nutrition label.

The agency also agrees that, since § 101.105(a) requires the net quantity of content declaration to include a numerical count when appropriate, there is little benefit to be derived from information on the number of units per container appearing in two different places on the label. However, when the supplement is in a liquid or powdered form, FDA believes additional information similar to that on conventional foods best informs the consumer about the dosage unit. Therefore, FDA tentatively concludes that for dietary supplements of vitamins and minerals in liquid or powdered form, "Serving size" and "Servings per container" should be stated consistent with § 101.9(d). The agency will propose its position on these issues in the rulemaking required by the DS Act.

261. Several comments, mostly from the dietary supplement industry, opposed the dual labeling of nutrient content "per unit" and "per day" if more than one unit is specified for consumption per day. Comments argued that dual declaration is impractical and will result in overcrowding of already small labels, creating consumer confusion and obfuscating the label's message. Other arguments against dual declaration were that such a requirement may discriminate against supplements that are not in the one-per-day format, and that it would force the industry to reformulate products so that labels can accommodate all of the information. One comment pointed out that the proposed regulation does not address how required information should be presented when the recommended daily dose is a range, e.g., 1 to 3 tablets per day.

Among the comments opposing dual declaration, however, there was disagreement as to which declaration is preferable, "per unit" or "per day." Some comments stated that it was the total amount of nutrients that is important, and therefore, declaration should be on a "per day" basis. These comments pointed out that FDA regulations (§ 105.77) promulgated in 1973 specified that dietary supplements be labeled according to the quantity specified for consumption during one day. The comment stated that although these regulations were withdrawn in 1979, most companies still comply with them.

Other comments stated that consumers may deviate from the recommended dose and should be given credit for being able to multiply quantities of nutrients by the number of units consumed. Therefore, these comments stated that declaration should be on a "per unit" basis. Comments pointed out that the U.S. Pharmacopeia is developing quality standards for dietary supplements in which they propose that nutrient information be presented "per dosage unit."

Other comments suggested that as an alternative to just one form of declaration on the label, the label could reference other labeling such as package inserts that contain all of the required information, or could permit either "per unit" or "per day" listing as long as the label clearly states which type of information is provided. A few comments favored dual declaration. One comment stated that omitting either declaration might confuse people who think that the nutrition information for one unit applies to a day or vice versa.

The agency is persuaded that dual declaration of nutrition information "per unit" and "per day," when a daily dose of more than one unit is recommended, may create a readability

problem for consumers, given the limited label space available on most dietary supplement products. FDA also agrees that recommended daily consumption of other than well defined dosages (e.g., "consume 1 to 3 tablets per day") would pose a problem in terms of labeling on a "per day" basis.

FDA is concerned that consumers have nutrition information available at the point of purchase upon which to base purchase decisions. Therefore, the agency is not considering package inserts which could be viewed only after purchase of the product. Additionally, rather than allowing manufacturers to label on a "per day" or "per unit" basis, the agency favors one consistent method of labeling. A consistent method will allow consumer education programs to explain how nutrition labeling is to always appear and to teach consumers how to calculate their individual consumption levels if their intake differs from the amount specified within the nutrition label. The agency believes labeling "per unit" is more useful in that the product will always be consumed "per unit," however, consumers may not always follow a manufacturer's recommendation to consume a certain number of units per day and therefore may not actually consume the amount indicated "per day."

For these reasons, and to harmonize with the U.S. Pharmacopeia, the agency tentatively concludes that nutrition information should be declared on a "per unit" basis. FDA intends to propose its position in the rulemaking that is required under the DS Act.

262. In the supplementary proposal, FDA proposed that nutrition labels for dietary supplements of vitamins and minerals include a column of quantitative amounts by weight and a second column of percent of RDI's, expressed as "Percent Daily Value." Comments were requested on the usefulness of a list of DRV's and the percent of the DRV for fat, saturated fat, cholesterol, carbohydrate, dietary fiber, and sodium provided by the supplement when they are declared (i.e., when they are present in the supplement in more than insignificant amounts) (56 FR 60366 at 60383). In the format proposal, FDA stated that it anticipated modifying § 101.36, Nutrition Labeling of Dietary Supplements, to be as consistent as possible with the nutrition labeling of other foods and requested comment (57 FR 32058 at 32072).

Several comments to both the supplementary proposal and the format proposal addressed the format for declaring amounts of nutrients present. About half of the comments supported FDA's position. However, one comment argued that the unique characteristics of dietary supplements demand a different approach to their nutrition labeling. Characteristics identified included: (1) The vast majority of supplements are marketed in relatively small packages, (2) the nutrition profiles for these products typically reflect high levels of micronutrients and relatively insignificant amounts of macronutrients, (3) consumers look for and expect nutrition information on supplements that is different from that on conventional foods, and (4) consumers of supplements will already be asked to search through an array of nutrient names and units of measure to find the information they look for most: The percentage of their daily nutritional requirements that the supplement provides.

One comment from a manufacturer stated that there was no need to make significant changes in dietary supplement labels because current labels that have been used for many years are widely accepted and present the necessary data on vitamins and minerals in a logical and readily understandable form. A comment from another manufacturer opposed the required declaration in separate columns of quantitative amounts by weight of nutrients and by the percent RDI or percent DRV (expressed as "Percent of Daily Value"). The comment argued that only percent of daily value should be mandatory, and that listing of quantitative amounts by weight should be voluntary, because there is no congressional mandate to list quantitative amounts on two bases, no agency justification that two bases are useful to consumers, and a potential to confuse consumers with little understood terms, e.g., mg alpha-tocopherol. The comment also asserted that a requirement for too much information is discriminatory against products with larger numbers of nutrients and might discourage use of smaller packages that are less expensive to consumers. The comment also stated that a requirement for declaration of only percent of daily value would be consistent with the requirement for vitamins and minerals on conventional food labels.

A few comments objected to the required inclusion of a list of daily values in addition to the quantitative amounts by weight and the percent of daily value on the label. The comments stated that this additional information will produce an even more cluttered appearance and further contribute to the proliferation of numerical values on dietary supplement labels. One comment argued that "The goal of meeting the supplement consumer's need for relevant, comprehensible nutrition information should not be sacrificed out of a blind concern for consistency." The comment concluded that consumers of supplements are already familiar and comfortable with the concept of percent of daily value and their focus on this information should not be diverted by additional unnecessary and potentially confusing information.

While FDA continues to believe it is helpful to consumers to minimize inconsistencies in the label format between types of foods, the agency is persuaded that the unique characteristics of dietary supplements require a reevaluation of whether the format requirements for conventional foods should be carried over to dietary supplements. For example, the agency believes that the declaration of quantitative amounts on two bases (i.e., both by weight and by percent of daily value) needs to be considered for dietary supplements in terms of its usefulness to consumers. In that regard, the agency considers dietary supplement consumers to have special needs for quantitative nutrition information about the products they use by virtue of the way such products are formulated, marketed, and used. Dietary supplements are often formulated and marketed on the basis of offering specific amounts of certain nutrients to consumers. Dietary supplement product users are often trying to maintain a certain quantitative intake of specific nutrients in their diets and use the product to obtain this quantitative goal. Some of the nutrients contained in dietary supplements and declared on the nutrition label are not well known to many consumers. The quantitative goals that are importantly relevant to consumption of dietary supplement products may be stated in various units including units of weight or of percent of RDI's or DRV's. FDA intends to address this issue in the rulemaking that it will undertake in response to the DS Act.

In its reevaluation of format requirements for dietary supplements, the agency also looked at the requirement in nutrition labeling of conventional foods for a list of daily values for all nutrients declared on the label. After careful consideration of the comments, the agency tentatively concludes that it is not necessary or appropriate to require the inclusion of the DV list on dietary supplements. Because of the small size of most supplement packages and the

duplication of the more complex nomenclature of units for vitamins (e.g., mg alpha-tocopherol) that would be required in a DV list, the agency believes that the added complexity and proliferation of numerical values would interfere with consumers use of the quantitative information by weight and by percent of daily value. FDA will propose its position regarding the format of the nutrition label for dietary supplements based on the provisions of the DS Act.

263. A few comments opposed the requirement for declaration of the quantitative amount and the percent of the DRV of fat, saturated fat, cholesterol, carbohydrate, dietary fiber, sodium, and potassium when these nutrients are present in a supplement in more than insignificant amounts. One comment suggested that the declaration either be optional or be required only when these nutrients are present at levels greater than 10 percent of their respective DRV's. The comment stated that: (1) Excessive and useless information would detract from the importance of a product's vitamin and mineral content; (2) even though the vast majority of supplements lack these substances, all products would have to undergo extensive and expensive testing to determine whether listing of these components is necessary, thus burdening small companies with diverse supplement product lines; and (3) these requirements would hinder product development and increase the cost of bringing innovative products to market. Another comment stated that declaration of fat should be required only for fatty acid supplements of 1 g or more per unit since declaration of smaller amounts would clutter the label and be difficult to read.

As discussed in the preceding comment, FDA agrees that the declaration of the amount of the DRV's (i.e., the DV list) is not necessary on labels of dietary supplements of vitamins and minerals. However, FDA continues to believe that the quantitative amount and the percent of the DRV should be declared for total fat, saturated fat, cholesterol, total carbohydrate, dietary fiber, sodium, and potassium when these nutrients are present in a supplement in more than insignificant amounts. Information about these food components, which are important to the maintenance of good health, is useful for consumers. This view was supported by comments from health professionals, consumer organizations, and the general public. Moreover, supplements are formulated products, and manufacturers should know from the ingredients that they use to make these products whether a supplement contains more than insignificant amounts of any of the nutrients for which DRV's have been established. When such ingredients are not used, laboratory analyses for such nutrients would be unnecessary. As discussed in comment 176 of this document, the definition of insignificant has been modified so that an "insignificant amount" of total carbohydrate, dietary fiber, and protein is an amount that allows a declaration of "less than 1 g" in the nutrition label. The agency will propose its position on this issue in the rulemaking that it does in response to the DS Act.

264. Several comments, predominantly from manufacturers and trade associations, disagreed with FDA's statement in the supplementary proposal that dietary supplements of selenium and chromium are not permitted because there are no regulations declaring these nutrients as approved food additives, GRAS, or prior-sanctioned ingredients. A trade association stated that nutrition labeling regulations are not the appropriate place to announce decisions about the GRAS status of nutrients. Comments argued that selenium and chromium are recognized as essential nutrients for humans. They pointed out that the National Research Council's Food and Nutrition Board has established a Recommended Dietary Allowance for selenium and an ESADDI for chromium (Ref. 23), and that FDA proposed RDI's for these nutrients. Moreover, comments stated that FDA has advised for many years that these trace minerals are "safe and suitable" for use in supplements. The comments argued that, therefore, FDA should adopt a general policy that trace minerals for which a Recommended Dietary Allowance or ESADDI has been established are GRAS, at least at levels not to exceed their respective Recommended Dietary Allowance/ESADDI.

The agency agrees that this rulemaking is not the appropriate place to announce decisions about the GRAS status of nutrients. Therefore, FDA reiterates that there are currently no sources of selenium or chromium that are either affirmed as GRAS or approved food additives for addition to human food. Any direct addition of these trace minerals to a food is based solely on the manufacturer's judgment that the nutrient sources are GRAS and is not sanctioned by the agency.

265. One comment advocated the parenthetical listing of the source of each vitamin or mineral immediately following its declaration on the nutrition information panel in lieu of a separate ingredient list. The comme argued that this listing would avoid confusion by enabling consumers to readily identify the nutrient source and would save limited label space. Furthermore, the comment stated that it is already common practice in the supplement industry. The comment suggested that information about the source of the nutrient would allow the consumer to identify whether the source is the most physiologically desirable, e.g., beta-carotene versus vitamin A palmitate.

FDA advises that dietary supplements, like any food, are required to bear a complete list of ingredients under section 403(l)(2) of the act, and such list should not be confused with the nutrition label. Ingredient listing, moreover, is needed for substances other than vitamins or minerals, e.g., lactose, other fillers, artificial colors, flavors, binders, and excipients. Consumers desiring to know the source of a nutrient can merely look at the list of ingredients just as they would for a conventional food product. Therefore, in accordance with ingredient labeling regulations, the specific source of vitamin A must be shown in the ingredient list.

However, in response to this and another similar comment (see comment 81 of this document), the agency is allowing for the declaration of the percent of vitamin A present as beta-carotene in § 101.9(c)(8)(vi). The agency will propose its position regarding a similar provision in nutrition labeling regulations pertaining to dietary supplements of vitamins and minerals following provisions of the DS Act.

266. One comment objected to the listing of the quantitative amounts of vitamins and minerals to the nearest unit of the same level of significance at which the RDI's are specified in § 101.9(c)(8)(iv). The comment stated that it would be potentially confusing to consumers for thiamin, for example, to be declared to the first decimal place, e.g., 100.0 mg, and niacin to be declared to the nearest whole number, e.g., 100 mg. The comment suggested that decimal places be dropped, and that all nutrients be listed to the nearest whole number when nutrient levels are ten or more times the RDI.

While FDA intends to deal with this issue in its rulemaking that responds to the DS Act, the agency offers the following comments. FDA is not persuaded that consumers would be confused by decimals for some nutrients and not others. In addition, requiring only whole numbers would introduce a large amount of imprecision in the declarations of some nutrients. For

example, it would cause 1.5 mg of thiamin (i.e., 100 percent of the RDI) to be rounded up to 2 mg—a 33 percent increase.

However, when the decimal is followed by a zero, the agency generally has no objection to the zero being dropped. In fact, in the supplementary proposal, this was done in the declaration of the amount of vitamin B12 in the hypothetical sample label for "Daily Vitamins Plus Iron" (56 FR 60366 at 60383). Since RDI's in § 101.9(c)(8)(iv) are established only in whole numbers or in tenths of a unit, allowing zeros following decimals to be dropped, in effect, allows all nutrients to be declared to the nearest whole number when nutrient levels are ten times the RDI.

267. A couple of comments objected to FDA's proposal that compliance with the requirements for labeling of dietary supplements be determined in accordance with § 101.9(g), i.e., 100 percent of label claim for Class I nutrients. Comments argued that the 100 percent requirement is unreasonable in that it is more stringent than United States Pharmacopeia (USP) requirements for certain vitamin and mineral products, which generally allow lower limits of 90 percent to 95 percent of label claim.

FDA intends to deal with this issue in the rulemaking that responds to the DS Act. However, the agency notes that dietary supplements are fabricated products. Therefore, the question is raised why they should not be held to the same Class I nutrient standards as conventional foods that are fortified or enriched. Based on the agency's current compliance policy it has informed USP that anything less than 100 percent of the label claim for vitamin and mineral products is not acceptable to FDA, and that the only permissible deviation from this requirement would be the variability of the analytical method (Ref. 118).

The agency notes that, contrary to the statement in the comments, the General Notices of the USP state that a dosage should be formulated to provide 100 percent of the labeled amount (Ref. 119). The limits in the monographs allow for overages of ingredients known to decrease with time, for analytical error, for manufacturing and compounding variations, and for deterioration to an extent considered insignificant under practical conditions (Ref. 119).

268. One comment asserted that manufacturers should be prohibited from labeling a supplement in such a way as to confuse the weight of a unit of supplement with its nutrient content. For example, a calcium supplement that contains 250 mg of elemental calcium as calcium chloride should not be labeled as "calcium—625 mg" anywhere on the label.

FDA concurs that such labeling is potentially misleading to consumers. Section 403(a) of the act provides that a food will be deemed to be misbranded if its labeling is false or misleading in any particular. FDA concludes that existing statutory authority is sufficient for taking regulatory action if the weight of a product is specified on the label in a manner that is likely to mislead consumers into thinking that that is the weight of the nutrient contained in the product if those amounts are different.

IX. Consumer Education Program

Section 2(c) of the 1990 amendments directs the Secretary (and FDA, by delegation) to carry out activities that educate consumers about nutrition information on the food label and the importance of that information in maintaining healthy dietary practices. To achieve this purpose, FDA and USDA have jointly initiated a multi-year food labeling education campaign. The major goals of this campaign are to increase consumers' knowledge and effective use of the new food label to make accurate and sound dietary choices; to integrate food labeling education into existing and new nutrition and health education programs; and to build extensive partnerships capable of developing and evaluating labeling education targeted to the dietary needs of diverse populations, such as low literacy consumers, minorities, older Americans, children, and people with dietary restrictions.

As part of this effort, the agencies have established the National Exchange on Food Labeling Education which includes an information center housed in the Food and Nutrition Information Center at the National Agricultural Library. The National Exchange on Food Labeling Education provides the general public and professionals with access to information about food labeling research and educational activities (projects, programs, and materials) from both the public and private sector.

FDA and USDA have also worked to establish cooperative projects with diverse organizations and to facilitate the communication of information that targets various subpopulations as well as the general public. The agencies have thus developed extensive food label education networks that include consumers, health professionals and organizations, educators, trade associations, Federal and local government, and many others to assist in the dissemination and development of information and activities.

To ensure that consumers have accurate and adequate resource materials and information, the agencies have begun, and will continue, to conduct and report on existing and planned food labeling research; to develop education initiatives at the national and local level; to hold regularly-scheduled meetings to build labeling education exchanges; to produce videos; and to produce an array of public education materials, including a special edition of FDA Consumer magazine that summarizes the final food labeling regulations, and brochures (in English and other languages) on the new label and how to use it to meet the Dietary Guidelines for Americans (Ref. 4). These materials will be targeted to the general public, nutritionists, such special groups as ethnic minorities, and others. Organizations will also be able to use these resource materials to develop educational materials of their own.

X. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96-354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule

as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

XI. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in its nutrition labeling proposed rules published in the **Federal Register** of November 27, 1991 (56 FR 60366 et al.), the agency determined that under 21 CFR 25.24(a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

In its November 1991 nutrition labeling proposed rules, the agency proposed that the final rules for these actions would become effective 6 months following their publication in the **Federal Register**. Several comments on the nutrition labeling proposed rules suggested that there would be significant adverse environmental effects from the final rules unless the agency allowed more time between the publication of the final rules and their effective dates. The concern in these comments was that, if the agency did not allow firms more time between the publication of the final rules and their effective dates to use up existing label inventories, large stocks of labels and labeled packaging would have to be discarded. These comments questioned whether the agency had sufficiently examined the impact of disposing of obsolete labels and labeled packaging on this country's solid waste disposal capabilities. Two comments estimated the amounts of labeling from their respective industries, i.e., dairy and confectionery, that would need to be discarded following publication of FDA's final rules on several food labeling actions, including this action. However, these comments did not: (1) Provide details on how these estimates were derived, (2) identify what portion of the estimated amounts are attributable to these two actions, or (3) describe what impact the discarded labels and packaging would have on the disposal of solid waste.

Based on its review of available data and comments received, the agency has decided to allow additional time for companies to use up their old labels. Thus, the nutrition labeling final rules will not be effective until May 8, 1994. FDA believes there will thus be ample time for food companies to use up most of the existing labeling and packaging stocks and to incorporate labeling language that complies with FDA's regulations into their food labels. Consequently, the comments on the potential for adverse environmental effects do not affect the agency's previous determination that no significant impact on the human environment is expected and that an environmental impact statement is not required.

List of Subjects

21 CFR Part 1

Cosmetics, Drugs, Exports, Food labeling, Imports, Labeling, Reporting and recordkeeping requirements.

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements, Incorporation by reference.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 1 and 101 are amended as follows:

PART 1—GENERAL ENFORCEMENT REGULATIONS

1. The authority citation for 21 CFR part 1 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 403, 502, 512, 602, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 343, 352, 355, 360, 362, 371); sec. 215 of the Public Health Service Act (42 U.S.C. 216).

2. Section 1.24 is amended by revising paragraph (a)(14) to read as follows:

§ 1.24 Exemptions from required label statements.

* * * * *

(a) * * *

(14) The unit containers in a multiunit or multicomponent retail food package shall be exempt from regulations of section 403 (e)(1), (g)(2), (i)(2), (k), and (q) of the act with respect to the requirements for label declaration

of the name and place of business of the manufacturer, packer, or distributor; label declaration of ingredients; and nutrition information when:

(i) The multiunit or multicomponent retail food package labeling meets all the requirements of this part;

(ii) The unit containers are securely enclosed within and not intended to be separated from the retail package under conditions of retail sale; and

(iii) Each unit container is labeled with the statement "This Unit Not Labeled For Retail Sale" in type size not less than one-sixteenth of an inch in height. The word "Individual" may be used in lieu of or immediately preceding the word "Retail" in the statement.

* * * * *

PART 101—FOOD LABELING

3. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

4. Section 101.9 is revised to read as follows:

§ 101.9 Nutrition labeling of food.

(a) Nutrition information relating to food shall be provided for all products intended for human consumption and offered for sale unless an exemption is provided for the product in paragraph (j) of this section. A nutrition claim or any other nutrition information on the label or in labeling or advertising in any context, and in any form of expression, implicit, as well as explicit, shall negate any exemption and subject a food to the provisions of this section.

(1) When food is in package form, the required nutrition labeling information shall appear on the label in the format specified in this section.

(2) When food is not in package form, the required nutrition labeling information shall be displayed clearly at the point of purchase (e.g., on a counter card, sign, tag affixed to the product, or some other appropriate device). Alternatively, the required information may be placed in a booklet, looseleaf binder, or other appropriate format that is available at the point of purchase.

(3) Solicitation of requests for nutrition information by a statement "For nutrition information write to _____" on the label or in the labeling or advertising for a food, or providing such information in a direct written reply to a solicited or unsolicited request, does not subject the label or the labeling of a food exempted under paragraph (j) of this section to the requirements of this section if the reply to the request conforms to the requirements of this section.

(4) If any vitamin or mineral is added to a food so that a single serving provides 50 percent or more of the Reference Daily Intake (RDI) for the age group for which the product is intended, as specified in paragraph (c)(8)(iv) of this section, of any one of the added vitamins or minerals, unless such addition is permitted or required in other regulations, e.g., a standard of identity or nutritional quality guideline, or is otherwise exempted by the Commissioner, the food shall be considered a food for special dietary use within the meaning of § 105.3(a)(1)(iii) of this chapter.

(b) [Reserved]

(c) The declaration of nutrition information on the label and in labeling of a food shall contain information about the level of the following nutrients, except for those nutrients whose inclusion, and the declaration of amounts, is voluntary as set forth in this paragraph. No nutrients or food components other than those listed in this paragraph as either mandatory or voluntary may be included within the nutrition label. Except as provided for in paragraphs (f) or (j) of this section, nutrient information shall be presented using the nutrient names specified and in the following order in the formats specified in paragraphs (d) or (e) of this section.

(1) "Calories, total," "Total calories," or "Calories": A statement of the caloric content per serving, expressed to the nearest 5-calorie increment up to and including 50 calories, and 10-calorie increment above 50 calories, except that amounts less than 5 calories may be expressed as zero. Energy content per serving may also be expressed in kilojoule units, added in parentheses immediately following the statement of the caloric content.

(i) Caloric content may be calculated by:

(A) Using specific Atwater factors (i.e., the Atwater method) given in Table 13, "Energy Value of Foods—Basis and Derivation," by A. L. Merrill and B. K. Watt, United States Department of Agriculture (USDA) Handbook No. 74 (slightly revised, 1973), which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 and is available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or may be inspected at the Office of the Federal Register, 800 North Capitol St. NW., suite 700, Washington, DC.;

(B) Using the general factors of 4, 4, and 9 calories per gram for protein, total carbohydrate, and total fat, respectively, as described in USDA Handbook No. 74 (slightly revised 1973) pp. 9–11, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 (the availability of this incorporation by reference is given in paragraph (c)(1)(i)(A) of this section);

(C) Using the general factors of 4, 4, and 9 calories per gram for protein, total carbohydrate less the amount of insoluble dietary fiber, and total fat, respectively, as described in USDA Handbook No. 74 (slightly revised 1973) pp. 9–11, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 (the availability of this incorporation by reference is given in paragraph (c)(1)(i)(A) of this section);

(D) Using data for specific food factors for particular foods or ingredients approved by the Food and Drug Administration (FDA) and provided in parts 172 or 184 of this chapter, or by other means, as appropriate; or

(E) Using bomb calorimetry data and subtracting 1.25 calories per gram protein to correct for incomplete digestibility, as described in USDA Handbook No. 74 (slightly revised 1973) p. 10, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 (the availability of this incorporation by reference is given in paragraph (c)(1)(i)(A) of this section).

(ii) "Calories from fat": A statement of the caloric content derived from total fat as defined in paragraph (c)(2) of this section in a serving, expressed to the nearest 5-calorie increment, up to and including 50 calories, and the nearest 10-calorie increment above 50 calories, except that label declaration of "calories from fat" is not required on products that contain less than 0.5 gram of fat in a serving and amounts less than 5 calories may be expressed as zero. This statement shall be declared as provided in paragraph (d)(5) of this section. Except as provided for in paragraph (f) of this section, if "Calories from fat" is not required and, as a result, not declared, the statement "Not a significant source of calories from fat" shall be placed at the bottom of the table of nutrient values in the same type size.

(iii) "Calories from saturated fat" or "Calories from saturated" (VOLUNTARY): A statement of the caloric content derived from saturated fat as defined in paragraph (c)(2)(i) of this section in a serving may be declared voluntarily, expressed to the nearest 5-

calorie increment, up to and including 50 calories, and the nearest 10-calorie increment above 50 calories, except that amounts less than 5 calories may be expressed as zero. This statement shall be indented under the statement of calories from fat as provided in paragraph (d)(5) of this section.

(2) "Fat, total" or "Total fat": A statement of the number of grams of total fat in a serving defined as total lipid fatty acids and expressed as triglycerides. Amounts shall be expressed to the nearest 0.5 (½) gram increment below 3 grams and to the nearest gram increment above 3 grams. If the serving contains less than 0.5 gram, the content shall be expressed as zero.

(i) "Saturated fat," or "Saturated": A statement of the number of grams of saturated fat in a serving defined as the sum of all fatty acids containing no double bonds, except that label declaration of saturated fat content information is not required for products that contain less than 0.5 gram of total fat in a serving if no claims are made about fat or cholesterol content, and if "calories from saturated fat" is not declared. Except as provided for in paragraph (f) of this section, if a statement of the saturated fat content is not required and, as a result, not declared, the statement "Not a significant source of saturated fat" shall be placed at the bottom of the table of nutrient values in the same type size. Saturated fat content shall be indented and expressed as grams per serving to the nearest 0.5 (½) gram increment below 3 grams and to the nearest gram increment above 3 grams. If the serving contains less than 0.5 gram, the content shall be expressed as zero.

(ii) "Polyunsaturated fat" or "Polyunsaturated" (VOLUNTARY): A statement of the number of grams of polyunsaturated fat in a serving defined as *cis,cis*-methylene-interrupted polyunsaturated fatty acids may be declared voluntarily, except that when monounsaturated fat is declared or when a claim is made on the label or in labeling about fatty acids or cholesterol, label declaration of polyunsaturated fat is required. Polyunsaturated fat content shall be indented and expressed as grams per serving to the nearest 0.5 (½) gram increment below 3 grams and to the nearest gram increment above 3 grams. If the serving contains less than 0.5 gram, the content shall be expressed as zero.

(iii) "Monounsaturated fat" or "Monounsaturated" (VOLUNTARY): A statement of the number of grams of monounsaturated fat in a serving defined as *cis*-monounsaturated fatty acids may be declared voluntarily except that when polyunsaturated fat is declared or when a claim is made on the label or in labeling about fatty acids or cholesterol, label declaration of monounsaturated fat is required. Monounsaturated fat content shall be indented and expressed as grams per serving to the nearest 0.5 (½) gram increment below 3 grams and to the nearest gram increment above 3 grams. If the serving contains less than 0.5 gram, the content shall be expressed as zero.

(3) "Cholesterol": A statement of the cholesterol content in a serving expressed in milligrams to the nearest 5-milligram increment, except that label declaration of cholesterol information is not required for products that contain less than 2 milligrams cholesterol in a serving and make no claim about fat, fatty acids, or cholesterol content, or such products may state the cholesterol content as zero. Except as provided for in paragraph (f) of this section, if cholesterol content is not required and, as a result, not declared, the statement "Not a significant source of cholesterol" shall be placed at the bottom of the table of nutrient values in the same type size. If the food contains 2 to 5 milligrams of cholesterol per serving, the content may be stated as "less than 5 milligrams."

(4) "Sodium": A statement of the number of milligrams of sodium in a specified serving of food expressed as zero when the serving contains less than 5 milligrams of sodium, to the nearest 5-milligram increment when the serving contains 5 to 140 milligrams of sodium, and to the nearest 10-milligram increment when the serving contains greater than 140 milligrams.

(5) "Potassium" (VOLUNTARY): A statement of the number of milligrams of potassium in a specified serving of food may be declared voluntarily, except that when a claim is made about potassium content, label declaration shall be required. Potassium content shall be expressed as zero when the serving contains less than 5 milligrams of potassium, to the nearest 5-milligram increment when the serving contains less than or equal to 140 milligrams of potassium, and to the nearest 10-milligram increment when the serving contains more than 140 milligrams.

(6) "Carbohydrate, total" or "Total carbohydrate": A statement of the number of grams of total carbohydrate in a serving expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, or if the serving contains less than 0.5 gram, the content may be expressed as zero. Total carbohydrate content shall be calculated by subtraction of the sum of the crude protein, total fat, moisture, and ash from the total weight of the food. This calculation method is described in A. L. Merrill and B. K. Watt, "Energy Value of Foods—Basis and Derivation," USDA Handbook 74 (slightly revised 1973) pp. 2 and 3, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 (the availability of this incorporation by reference is given in paragraph (c)(1)(i)(A) of this section).

(i) "Dietary fiber": A statement of the number of grams of total dietary fiber in a serving, indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, declaration of dietary fiber is not required or, alternatively, the statement "Contains less than 1 gram" or "less than 1 gram" may be used, and if the serving contains less than 0.5 gram, the content may be expressed as zero. Except as provided for in paragraph (f) of this section, if dietary fiber content is not required and as a result, not declared, the statement "Not a significant source of dietary fiber" shall be placed at the bottom of the table of nutrient values in the same type size.

(A) "Soluble fiber" (VOLUNTARY): A statement of the number of grams of soluble dietary fiber in a serving may be declared voluntarily except when a claim is made on the label or in labeling about soluble fiber, label declaration shall be required. Soluble fiber content shall be indented under dietary fiber and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(B) "Insoluble fiber" (VOLUNTARY): A statement of the number of grams of insoluble dietary fiber in a serving may be declared voluntarily except that when a claim is made on the label or in labeling about insoluble fiber, label declaration shall be required. Insoluble fiber content shall be indented under dietary fiber and expressed to the nearest gram except that if a serving contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(ii) "Sugars": A statement of the number of grams of sugars in a serving, except that label declaration of sugars content is not required for products that contain less than 1 gram of sugars in a

serving if no claims are made about sweeteners, sugars, or sugar alcohol content. Except as provided for in paragraph (f) of this section, if a statement of the sugars content is not required and, as a result, not declared, the statement "Not a significant source of sugars" shall be placed at the bottom of the table of nutrient values in the same type size. Sugars shall be defined as the sum of all free mono- and disaccharides (such as glucose, fructose, lactose, and sucrose). Sugars content shall be indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less then 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(iii) "Sugar alcohol" (VOLUNTARY): A statement of the number of grams of sugar alcohols in a serving may be declared voluntarily on the label, except that when a claim is made on the label or in labeling about sugar alcohol or sugars when sugar alcohols are present in the food, sugar alcohol content shall be declared. For nutrition labeling purposes, sugar alcohols are defined as the sum of saccharide derivatives in which a hydroxyl group replaces a ketone or aldehyde group and whose use in the food is listed by FDA (e.g., mannitol) or is generally recognized as safe (e.g., xylitol, sorbitol). In lieu of the term "sugar alcohol," the name of the specific sugar alcohol (e.g., "xylitol") present in the food may be used in the nutrition label provided that only one sugar alcohol is present in the food. Sugar alcohol content shall be indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less then 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(iv) "Other carbohydrate" (VOLUNTARY): A statement of the number of grams of other carbohydrates may be declared voluntarily. Other carbohydrates shall be defined as the difference between total carbohydrate and the sum of dietary fiber, sugars, and sugar alcohol, except that if sugar alcohol is not declared (even if present), it shall be defined as the difference between total carbohydrate and the sum of dietary fiber and sugars. Other carbohydrate content shall be indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(7) "Protein": A statement of the number of grams of protein in a serving, expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero. When the protein in foods represented or purported to be for adults and children 4 or more years of age has a protein quality value that is a protein digestibility-corrected amino acid score of less than 20 expressed as a percent, or when the protein in a food represented or purported to be for children greater than 1 but less than 4 years of age has a protein quality value that is a protein digestibility-corrected amino acid score of less than 40 expressed as a percent, either of the following shall be placed adjacent to the declaration of protein content by weight: The statement "not a significant source of protein," or a listing aligned under the column headed "Percent Daily Value" of the corrected amount of protein per serving, as determined in paragraph (c)(7)(ii) of this section, calculated as a percentage of the Daily Reference Value (DRV) or Reference Daily Intake (RDI), as appropriate, for protein and expressed as Percent of Daily Value. When the protein quality in a food as measured by the Protein Efficiency Ratio (PER) is less than 40 percent of the reference standard (casein) for a food represented or purported to be for infants, the statement "not a significant source of protein" shall be placed adjacent to the declaration of protein content. Protein content may be calculated on the basis of the factor of 6.25 times the nitrogen content of the food as determined by the appropriate method of analysis as given in the "Official Methods of Analysis of the AOAC International" (formerly the Association of Official Analytical Chemists), 15th Ed. (1990), which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51, except when the official procedure for a specific food requires another factor. Copies may be obtained from AOAC, 2200 Wilson Blvd., suite 400, Arlington, VA 22201-3301, or may be inspected at the Office of the Federal Register, 800 North Capitol St. NW., suite 700, Washington, DC.

(i) A statement of the corrected amount of protein per serving, as determined in paragraph (c)(7)(ii) of this section, calculated as a percentage of the RDI or DRV for protein, as appropriate, and expressed as Percent of Daily Value, may be placed on the label, except that such a statement shall be given if a protein claim is made for the product, or if the product is represented or purported to be for use by infants or children under 4 years of age. When such a declaration is provided, it shall be placed on the label adjacent to the statement of grams of protein and aligned under the column headed "Percent Daily Value," and expressed to the nearest whole percent. However, the percentage of the RDI for protein shall not be declared if the food is represented or purported to be for use by infants and the protein quality value is less than 40 percent of the reference standard.

(ii) The "corrected amount of protein (gram) per serving" for foods represented or purported for adults and children 1 or more years of age is equal to the actual amount of protein (gram) per serving multiplied by the amino acid score corrected for protein digestibility. If the corrected score is above 1.00, then it shall be set at 1.00. The protein digestibility-corrected amino acid score shall be determined by methods given in sections 5.4.1, 7.2.1, and 8.00 in "Protein Quality Evaluation, Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation," Rome, 1990, except that when official AOAC procedures described in section (c)(7) of this paragraph require a specific food factor other than 6.25, that specific factor shall be used. The "Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation" as published by the Food and Agriculture Organization of the United Nations/World Health Organization is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies are available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or may be inspected at the Office of the Federal Register, 800 North Capitol St. NW., suite 700, Washington, DC. For foods represented or purported for infants, the corrected amount of protein (grams) per serving is equal to the actual amount of protein (grams) per serving multiplied by the relative protein quality value The relative protein quality value shall be determined by dividing the subject food protein PER value by the PER value for casein. If the relative protein value is above 1.00, it shall be set at 1.00.

(iii) [Reserved]

(8) Vitamins and minerals: A statement of the amount per serving of the vitamins and minerals as described in this paragraph, calculated as a

percent of the RDI and expressed as percent of Daily Value.

(i) For purposes of declaration of percent of Daily Value as provided for in paragraphs (d), (e), and (f) of this section, foods represented or purported to be for use by infants, children less than 4 years of age, pregnant women, or lactating women shall use the RDI's in paragraph (c)(8)(iv) of this section that are specified for the intended group. For foods represented or purported to be for use by both infants and children under 4 years of age, the percent of Daily Value shall be presented by separate declarations according to paragraph (e) of this section based on the RDI values for infants from birth to 12 months of age and for children under 4 years of age. Similarly, the percent of Daily Value based on both the RDI values for pregnant women and for lactating women shall be declared separately on foods represented or purported to be for use by both pregnant and lactating women. When such dual declaration is used on any label, it shall be included in all labeling, and equal prominence shall be given to both values in all such labeling. All other foods shall use the RDI for adults and children 4 or more years of age.

(ii) The declaration of vitamins and minerals as a percent of the RDI shall include vitamin A, vitamin C, calcium, and iron, in that order, and shall include any of the other vitamins and minerals listed in paragraph (c)(8)(iv) of this section when they are added as a nutrient supplement, or when a claim is made about them. Other vitamins and minerals that are:

(A) Required or permitted in a standardized food (e.g., thiamin, riboflavin, and niacin in enriched flour) and that standardized food is included as an ingredient (i.e., component) in another food; or

(B) Included in a food solely for technological purposes and declared only in the ingredient statement need not be declared if neither the nutrient nor the component is otherwise referred to on the label or in labeling or advertising. The declaration may also include any of the other vitamins and minerals listed in paragraph (c)(8)(iv) of this section when they are naturally occurring in the food. The additional vitamins and minerals shall be listed in the order established in paragraph (c)(8)(iv) of this section.

(iii) The percentages for vitamins and minerals shall be expressed to the nearest 2-percent increment up to and including the 10-percent level, the nearest 5-percent increment above 10 percent and up to and including the 50-percent level, and the nearest 10-percent increment above the 50-percent level. Amounts of vitamins and minerals present at less than 2 percent of the RDI are not required to be declared in nutrition labeling but may be declared by a zero or by the use of an asterisk (or other symbol) that refers to another asterisk (or symbol) that is placed at the bottom of the table and that is followed by the statement "Contains less than 2 percent of the Daily Value of this (these) nutrient (nutrients)." Alternatively, except as provided for in paragraph (f) of this section, if vitamin A, vitamin C, calcium, or iron is present in amounts less than 2 percent of the RDI, label declaration of the nutrient(s) is not required if the statement "Not a significant source of _____ (listing the vitamins or minerals omitted)" is placed at the bottom of the table of nutrient values. Either statement shall be in the same type size as nutrients that are indented.

(iv) [Reserved]

(v) The following synonyms may be added in parentheses immediately following the name of the nutrient or dietary component:

Vitamin C—Ascorbic acid
Thiamin—Vitamin B_1
Riboflavin—Vitamin B_2
Folate—Folacin
Calories—Energy

(vi) The percent of vitamin A that is present as beta-carotene may be declared to the nearest 10-percent increment immediately adjacent to or beneath the nutrient name (e.g., "Vitamin A (90 percent as beta-carotene)").

(9) [Reserved]

(d)(1) Nutrient information specified in paragraph (c) of this section shall be presented on foods in the following format, as shown in paragraph (d)(12) of this section, except on foods on which dual columns of nutrition information are declared as provided for in paragraph (e) of this section, on those food products on which the simplified format is required to be used as provided for in paragraph (f) of this section, on foods for infants and children less than 4 years of age as provided for in paragraph (j)(5) of this section, and on foods in small or intermediate-sized packages as provided for in paragraph (j)(13) of this section. In the interest of uniformity of presentation, FDA urges that the nutrition information be presented using the graphic specifications set forth in Appendix B to Part 101.

(i) The nutrition information shall be set off in a box by use of hairlines and shall be all black or one color type, printed on a white or other neutral contrasting background whenever practical.

(ii) All information within the nutrition label shall utilize:

(A) A single easy-to-read type style,

(B) Upper and lower case letters,

(C) At least one point leading (i.e., space between two lines of text) except that at least four points leading shall be utilized for the information required by paragraphs (d)(7) and (d)(8) of this section as shown in paragraph (d)(12), and

(D) Type that is kerned (i.e., has proximity of placement) no tighter than −4 setting.

(iii) All information except for the information required in paragraphs (d)(4), (d)(6), (d)(9), and (d)(10) of this section shall be in type size no smaller than 8 point. The information required in paragraphs (d)(4), (d)(6), (d)(9), and (d)(10) of this section shall be in type size no smaller than 6 point.

(iv) The headings required by paragraphs (d)(2), (d)(4), and (d)(6) of this section (i.e., "Nutrition Facts," "Amount per Serving," and "% Daily Value*"), the names of all nutrients that are not indented according to requirements of paragraph (c) of this section (i.e., "Calories," "Total Fat," "Cholesterol," "Sodium," "Total Carbohydrate," and "Protein"), and the percentage amounts required by paragraph (d)(7)(ii) of this section shall be highlighted by bold or extra bold type or other highlighting (reverse printing is not permitted as a form of highlighting) that prominently distinguishes it from other information. No other information shall be highlighted.

(v) A hairline rule that is centered between the lines of text shall separate "Amount Per Serving" from the calorie statements required in paragraph (d)(5) of this section and shall separate each nutrient and its corresponding percent Daily Value required in paragraphs (d)(7)(i) and (d)(7)(ii) of this section from the nutrient and percent Daily Value above and below it, as shown in paragraph (d)(12) of this section.

(2) The information shall be presented under the identifying heading of "Nutrition Facts" which shall be set in a type size larger than all other print size in the nutrition label and, except for labels presented according to the format provided for in paragraph (d)(11) of this section, unless impractical, shall be set the full width of the information provided under paragraph (d)(7) of this section, as shown in paragraph (d)(12) of this section.

(3) Information on serving size shall immediately follow the heading as

shown in paragraph (d)(12) of this section. Such information shall include:

(i) "Serving Size": A statement of the serving size as specified in paragraph (b)(7) of this section.

(ii) "Servings Per Container": The number of servings per container, except that this statement is not required on single serving containers as defined in paragraph (b)(6) of this section.

(4) A subheading "Amount Per Serving" shall be separated from serving size information by a bar as shown in paragraph (d)(12) of this section.

(5) Information on calories shall immediately follow the heading "Amount Per Serving" and shall be declared in one line, leaving sufficient space between the declaration of "Calories" and "Calories from fat" to allow clear differentiation, or, if "Calories from saturated fat" is declared, in a column with total "Calories" at the top, followed by "Calories from fat" (indented), and "Calories from saturated fat" (indented).

(6) The column heading "% Daily Value," followed by an asterisk (e.g., "% Daily Value*"), shall be separated from information on calories by a bar as shown in paragraph (d)(12) of this section. The position of this column heading shall allow for a list of nutrient names and amounts as described in paragraph (d)(7) of this section to be to the left of, and below, this column heading. The column headings "Percent Daily Value," "Percent DV," or "% DV" may be substituted for "% Daily Value."

(7) Except as provided for in paragraph (j)(13) of this section, nutrient information for all nutrients required by paragraph (c) of this section, except vitamins and minerals, shall be declared as follows:

(i) The name of each nutrient specified in paragraph (c) of this section shall be given in a column and followed immediately by the quantitative amount by weight for that nutrient appended with a "g" for grams or "mg" for milligrams as shown in paragraph (d)(12) of this section.

(ii) A listing of the percent of the DRV as established in paragraphs (c)(7)(iii) and (c)(9) of this section shall be given in a column aligned under the heading "% Daily Value" established in paragraph (d)(6) of this section with the percent expressed to the nearest whole percent for each nutrient declared in the column described in paragraph (d)(7)(i) of this section for which a DRV has been established, except that the percent for protein may be omitted as provided in paragraph (c)(7) of this section. The percent shall be calculated by dividing the actual amount (i.e., before rounding) for each nutrient by the DRV for the nutrient, except that the percent for protein shall be calculated as specified in paragraph (c)(7)(ii) of this section. The numerical value shall be followed by the symbol for percent (i.e., %).

(8) Nutrient information for vitamins and minerals shall be separated from information on other nutrients by a bar and shall be arrayed horizontally (e.g., Vitamin A 4%, Vitamin C 2%, Calcium 15%, Iron 4%) as shown in paragraph (d)(12) of this section, except that when more than four vitamins and minerals are declared, they may be declared vertically with percentages listed under the column headed "% Daily Value."

(9) A footnote, preceded by an asterisk, shall be placed beneath the list of vitamins and minerals and shall be separated from that list by a hairline.

(i) The footnote shall state:

Percent Daily Values are based on a 2,000 calorie diet.

Your daily value may be higher or lower depending on your calorie needs.

	Calories:	2,000	2,500
Total fat	Less than	65 g	80 g
Saturated fat.	Less than	20 g	25 g
Cholesterol	Less than	300 mg	300 mg
Sodium	Less than	2,400 mg	2,400 mg
Total carbohydrate.	.....	300 g	375 g
Dietary fiber	.....	25 g	30 g

(ii) If the percent of Daily Value is given for protein in the Percent of Daily Value column as provided in paragraph (d)(5)(ii) of this section, protein shall be listed under dietary fiber, and the DRV established in paragraph (c)(7)(iii) of this section shall be inserted on the same line in the numeric columns.

(iii) If potassium is declared in the column described in paragraph (d)(5)(i) of this section, potassium shall be listed under sodium and the DRV established in paragraph (c)(9) of this section shall be inserted on the same line in the numeric columns.

(iv) The abbreviations established in paragraph (j)(13)(ii)(B) of this section may be used within the footnote.

(10) Caloric conversion information on a per gram basis for fat, carbohydrate, and protein shall be presented beneath the information required in paragraph (d)(9) and shall be separated from that information by a hairline. This information may be presented horizontally as shown in paragraph (d)(12) of this section (i.e., "Calories per gram: fat 9, carbohydrate 4, protein 4") or vertically in columns.

(11) If the space beneath the information on vitamins and minerals is not adequate to accommodate the information required in paragraphs (d)(9) and (d)(10) of this section, the information required in paragraph (d)(9) may be moved to the right of the column required in paragraph (d)(7)(ii) and set off by a line that distinguishes it and sets it apart from the percent daily value information The caloric conversion information required in paragraph (d)(10) of this section may be presented beneath either side or along the full length of the nutrition label.

(12) The following sample label illustrates the provisions of paragraph (d) of this section.

BILLING CODE 4160-01-m

Nutrition Facts

Serving Size 1/12 cup (45g)
Servings Per Container 12

Amount Per Serving	Mix	Baked
Calories	190	280
Calories from Fat	45	135

**Percent Daily Values are based on a 2,000 calorie diet. Your daily values may be higher or lower depending on your calorie needs:

	Calories:	2,000	2,500
Total Fat	Less than	65g	80g
Sat Fat	Less than	20g	25g
Cholesterol	Less than	300mg	300mg
Sodium	Less than	2,400mg	2,400mg
Total Carbohydrate		300g	375g
Dietary Fiber		25g	30g

Calories per gram:
Fat 9 • Carbohydrate 4 • Protein 4

(e) Nutrition information may be presented for two or more forms of the same food (e.g., both "as purchased" and "as prepared") or for common combinations of food as provided for in paragraph (h)(4) of this section, for different units (e.g., slices of bread or per 100 grams) as provided for in paragraph (b) of this section, or for two or more groups for which RDI's are established in paragraph (c)(8)(iv) of this section (e.g., both infants and children less than 4 years of age) as shown in paragraph (e)(5) of this section. When such dual labeling is provided, equal prominence shall be given to both sets of values. Information shall be presented in a format consistent with paragraph (d) of this section, except that:

(1) Following the subheading of "Amount Per Serving," there shall be two or more column headings accurately describing the forms of the same food (e.g., "Mix" and "Baked"), the combinations of food, the units, or the RDI groups that are being declared. The column representing the product as packaged and according to the label serving size based on the reference amount in § 101.12(b) shall be to the left of the numeric columns.

(2) When the dual labeling is presented for two or more forms of the same food, for combinations of food, or for different units, total calories and calories from fat (and calories from saturated fat, when declared) shall be listed in a column and indented as specified in paragraph (d)(5) of this section with quantitative amounts declared in columns aligned under the column headings set forth in paragraph (e)(1) of this section.

(3) Quantitative information by weight required in paragraph (d)(7)(i) of this section shall be specified for the form of the product as packaged and according to the label serving size based on the reference amount in § 101.12(b).

(i) Quantitative information by weight may be included for other forms of the product represented by the additional column(s) either immediately adjacent to the required quantitative information by weight for the product as packaged and according to the label serving size* based on the reference amount in § 101.12(b) or as a footnote.

(A) If such additional quantitative information is given immediately adjacent to the required quantitative information, it shall be declared for all nutrients listed and placed immediately following and differentiated from the required quantitative information (e.g., separated by a comma). Such information shall not be put in a separate column.

(B) If such additional quantitative information is given in a footnote, it shall be declared in the same order as the nutrients are listed in the nutrition label. The additional quantitative information may state the total nutrient content of the product identified in the second column or the nutrient amounts added to the product as packaged for only those nutrients that are present in different amounts than the amounts declared in the required quantitative information. The footnote shall clearly identify which amounts are declared. Any subcomponents declared shall be listed parenthetically after principal components (e.g., 1/2 cup skim milk contributes an additional 40 calories, 65 mg sodium, 6 g total carbohydrate (6 g sugars), and 4 g protein).

(ii) Total fat and its quantitative amount by weight shall be followed by an asterisk (or other symbol) (e.g., "Total fat (2 g)*") referring to another asterisk (or symbol) at the bottom of the nutrition label identifying the form(s) of the product for which quantitative information is presented.

(4) Information required in paragraphs (d)(7)(ii) and (d)(8) of this section shall be presented under the subheading "% DAILY VALUE" and in columns directly under the column headings set forth in paragraph (e)(1) of this section.

(5) The following sample label illustrates the provisions of paragraph (e) of this section:

BILLING CODE 4160-01-M

Nutrition Facts

Dietary Fiber		25g	30g

Calories per gram:
Fat 9 • Carbohydrate 4 • Protein 4

(f) The declaration of nutrition information may be presented in the simplified format set forth herein when a food product contains insignificant amounts of seven or more of the following: Calories, total fat, saturated fat, cholesterol, sodium, total carbohydrate, dietary fiber, sugars, protein, vitamin A, vitamin C, calcium, and iron; except that for foods intended for children less than 2 years of age to which § 101.9(j)(5)(i) applies, nutrition information may be presented in the simplified format when a food product contains insignificant amounts of six or more of the following: Calories, total fat, sodium, total carbohydrate, dietary fiber, sugars, protein, vitamin A, vitamin C, calcium, and iron.

(1) An "insignificant amount" shall be defined as that amount that allows a declaration of zero in nutrition labeling, except that for total carbohydrate, dietary fiber, and protein, it shall be an amount that allows a declaration of "less than 1 gram."

(2) The simplified format shall include information on the following nutrients:

(i) Total calories, total fat, total carbohydrate, protein, and sodium;

(ii) Calories from fat and any other nutrients identified in paragraph (f)(1) of this section that are present in the food in more than insignificant amounts; and

(iii) Any vitamins and minerals listed in paragraph (c)(8)(iv) of this section when they are required to be added as a nutrient supplement to foods for which a standard of identity exists.

(iv) Any vitamins or minerals that are voluntarily added to the food as nutrient supplements.

(3) Other nutrients that are naturally present in the food in more than insignificant amounts may be voluntarily declared as part of the simplified format.

(4) If any nutrients are declared as provided in paragraphs (f)(2)(iii), (f)(2)(iv), or (f)(3) of this section as part of the simplified format, the statement "Not a significant source of _____" (with the blank filled in with the name(s) of any nutrient(s) identified in § 101.9(f) and calories from fat that are present in insignificant amounts) shall be included at the bottom of the nutrition label.

(5) Except as provided for in paragraphs (j)(5) and (j)(13) of this section, nutrient information declared in the simplified format shall be presented in the same manner as specified in paragraphs (d) or (e) of this section, except that the footnote and caloric conversion information required in paragraphs (d)(9) and (d)(10) of this section are not required. When the footnote and caloric conversion information are omitted, an asterisk shall be placed at the bottom of the label followed by the statement "Percent Daily Values are based on a 2,000 calorie diet" and, if the term "Daily Value" is not spelled out in the heading, a statement that "DV" represents "Daily Value."

(g) Compliance with this section shall be determined as follows:

(1) A collection of primary containers or units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, or in the absence of any common container code or marking, a day's production, constitutes a "lot."

(2) The sample for nutrient analysis shall consist of a composite of 12 subsamples (consumer units), taken 1 from each of 12 different randomly chosen shipping cases, to be representative of a lot. Unless a particular method of analysis is specified in paragraph (c) of this section, composites shall be analyzed by appropriate methods as given in the "Official Methods of Analysis of the AOAC International," 15th Ed. (1990), which is incorporated by reference in accordance with 5 U.S.C. 552(a) or 1 CFR part 51 or, if no AOAC method is available or appropriate, by other reliable and appropriate analytical procedures. The availability of this incorporation by reference is given in paragraph (c)(7) of this section.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) *Class I.* Added nutrients in fortified or fabricated foods; and

(ii) *Class II.* Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to class II requirements unless the same nutrient is also added.

(4) A food with a label declaration of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium shall be deemed to be misbranded under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act) unless it meets the following requirements:

(i) *Class I vitamin, mineral, protein, • dietary fiber, or potassium.* The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) *Class II vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium.* The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label.

Provided, That no regulatory action will be based on a determination of a nutrient value that falls below this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

(5) A food with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be deemed to be misbranded under section 403(a) of the act if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label. *Provided,* That no regulatory action will be based on a determination of a nutrient value that falls above this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

(6) Reasonable excesses of a vitamin, mineral, protein, total carbohydrate, dietary fiber, other carbohydrate, polyunsaturated or monounsaturated fat, or potassium over labeled amounts are acceptable within current good manufacturing practice. Reasonable deficiencies of calories, sugars, total fat, saturated fat, cholesterol, or sodium under labeled amounts are acceptable within current good manufacturing practice.

(7) Compliance will be based on the metric measure specified in the label statement of serving size.

(8) Compliance with the provisions set forth in paragraphs (g)(1) through (g)(6) of this section may be provided by use of an FDA approved data base that has been computed following FDA guideline procedures and where food samples have been handled in accordance with current good manufacturing practice to prevent nutrition loss. FDA approval of a data base shall not be considered granted until the Center for Food Safety and Applied Nutrition has agreed to all aspects of the data base in writing. The approval will be granted where a clear need is presented (e.g., raw produce and seafood). Approvals will be in effect for a limited time, e.g., 10 years, and will be eligible for renewal in the absence of significant changes in agricultural or industry practices. Approval requests shall be submitted in accordance with the provisions of § 10.30 of this chapter. Guidance in the use of data bases may be found in the "FDA Nutrition Labeling Manual—A Guide for Developing and Using Data Bases," available from the Division of Nutrition, Center for Food Safety and Applied

Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

(9) When it is not technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of this section (e.g., to develop adequate nutrient profiles to comply with the requirements of paragraph (c) of this section), FDA may permit alternative means of compliance or additional exemptions to deal with the situation. Firms in need of such special allowances shall make their request in writing to the Office of Nutrition and Food Sciences (HFF–200), Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

(h) Products with separately packaged ingredients or foods, with assortments of food, or to which other ingredients are added by the user may be labeled as follows:

(1) If a product consists of two or more separately packaged ingredients enclosed in an outer container or of assortments of the same type of food (e.g., assorted nuts or candy mixtures) in the same retail package, nutrition labeling shall be located on the outer container or retail package (as the case may be) to provide information for the consumer at the point of purchase. However, when two or more food products are simply combined together in such a manner that no outer container is used, or no outer label is available, each product shall have its own nutrition information, e.g., two boxes taped together or two cans combined in a clear plastic overwrap. When separately packaged ingredients or assortments of the same type of food are intended to be eaten at the same time, the nutrition information may be specified per serving for each component or as a composite value.

(2) If a product consists of two or more separately packaged foods that are intended to be eaten individually and that are enclosed in an outer container (e.g., variety packs of cereals or snack foods), the nutrition information shall be specified per serving for each food in a location that is clearly visible to the consumer at the point of purchase.

(3) If a package contains a variety of foods, or an assortment of foods, and is in a form intended to be used as a gift, the nutrition labeling shall be in the form required by paragraphs (a) through (f) of this section, but it may be modified as follows:

(i) Nutrition information may be presented on the label of the outer package or in labeling within or attached to the outer package.

(ii) In the absence of a reference amount customarily consumed in § 101.12(b) that is appropriate for the variety or assortment of foods in a gift package, 1 ounce for solid foods, 2 fluid ounces for nonbeverage liquids (e.g., syrups), and 8 fluid ounces for beverages may be used as the standard serving size for purposes of nutrition labeling of foods subject to this paragraph. However, the reference amounts customarily consumed in § 101.12(b) shall be used for purposes of evaluating whether individual foods in a gift package qualify for nutrient content claims or health claims.

(iii) The number of servings per container may be stated as "varied."

(iv) Nutrition information may be provided per serving for individual foods in the package, or, alternatively, as a composite per serving for reasonable categories of foods in the package having similar dietary uses and similar significant nutritional characteristics. Reasonable categories of foods may be used only if accepted by FDA. In determining whether a proposed category is reasonable, FDA will consider whether the values of the characterizing nutrients in the foods proposed to be in the category meet the compliance criteria set forth in paragraphs (g)(3) through (g)(6) of this section. Proposals for such categories may be submitted in writing to the Office of Nutrition and Food Sciences (HFF–200), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

(v) If a food subject to paragraph (j)(13) of this section because of its small size is contained in a gift package, the food need not be included in the determination of nutrition information under paragraph (h) of this section if it is not specifically listed in a promotional catalogue as being present in the gift package, and:

(A) It is used in small quantities primarily to enhance the appearance of the gift package; or

(B) It is included in the gift package as a free gift or promotional item.

(4) If a food is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare nutrition information on the basis of the food as consumed in the format required in paragraph (e) of this section (e.g., a dry ready-to-eat cereal may be described with one set of Percent Daily Values for the cereal as sold (e.g., per ounce), and another set for the cereal and milk as suggested in the label (e.g., per ounce of cereal and 1/2 cup of vitamin D fortified skim milk) and a cake mix may be labeled with one set of Percent Daily Values for the dry mix (per serving) and another set for the serving of the final cake when prepared): *Provided,* That, the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(i) Except as provided in paragraph (j)(13) of this section, the location of nutrition information on a label shall be in compliance with § 101.2.

(j) The following foods are exempt from this section or are subject to special labeling requirements:

(1)(i) Food offered for sale by a manufacturer, packer, or distributor who has annual gross sales made or business done in sales to consumers that is not more than $500,000 or has annual gross sales made or business done in sales of food to consumers of not more than $50,000, *Provided,* That the food bears no nutrition claims or information on a label or labeling or in advertising.

(ii) For purposes of this paragraph, calculation of the amount of sales shall be based on the most recent 2-year average of business activity. Where firms have been in business less than 2 years, reasonable estimates must indicate that annual sales will not exceed the amounts specified. For foreign firms that ship foods into the United States, the business activities to be included shall be the total amount of food sales, as well as other sales to consumers, by the firm in the United States.

(2) Food products which are:

(i) Served in restaurants;

(ii) Served in other establishments in which food is served for immediate human consumption (e.g., institutional food service establishments, such as schools, hospitals, and cafeterias; transportation carriers, such as trains and airplanes; bakeries, delicatessens, and retail confectionery stores where there are facilities for immediate consumption on the premises; food service vendors, such as lunch wagons, ice cream shops, mall cookie counters, vending machines, and side-walk carts where foods are generally consumed immediately where purchased or while the consumer is walking away, including similar foods sold from convenience stores; and food delivery systems or establishments where ready-to-eat foods are delivered to homes or offices);

(iii) Sold for sale or use only in such facilities; or

(iv) Sold by a distributor who principally sells food to such facilities: *Provided,* That:

(A) This exemption shall not be available for those foods that are manufactured, processed, or repackaged by that distributor for sale to any persons other than restaurants or other establishments that serve food for immediate human consumption, and

(B) The manufacturer of such products is responsible for providing the nutrition information on the products if there is a reasonable possibility that the product will be purchased directly by consumers.

(3) Food products that are:

(i) Of the type of food described in paragraphs (j)(2)(i) and (j)(2)(ii) of this section,

(ii) Ready for human consumption,

(iii) Offered for sale to consumers but not for immediate human consumption,

(iv) Processed and prepared primarily in a retail establishment, and

(v) Not offered for sale outside of that establishment (e.g., ready-to-eat foods that are portioned and packaged on-site and sold by independent delicatessens, bakeries, and retail confectionery stores where there are no facilities for immediate human consumption, by in-store delicatessen, bakery, or candy departments, or at self-service food bars such as salad bars).

(4) Foods that contain insignificant amounts of all of the nutrients and food components required to be included in the declaration of nutrition information under paragraph (c) of this section. An insignificant amount of a nutrient or food component shall be that amount that allows a declaration of zero in nutrition labeling, except that for total carbohydrate, dietary fiber, and protein, it shall be an amount that allows a declaration of "less than 1 gram." Foods that are exempt under this paragraph include coffee beans (whole or ground), tea leaves, plain unsweetened instant coffee and tea, condiment-type dehydrated vegetables, flavor extracts, and food colors.

(5)(i) Foods, other than infant formula, represented or purported to be specifically for infants and children less than 2 years of age shall bear nutrition labeling, except as provided in paragraph (j)(5)(ii) and except that such labeling shall not include calories from fat (paragraph (c)(1)(ii) of this section), calories from saturated fat ((c)(1)(iii)), saturated fat ((c)(2)(i)), polyunsaturated fat ((c)(2)(ii)), monounsaturated fat ((c)(2)(iii)), and cholesterol ((c)(3)).

(ii) Foods, other than infant formula, represented or purported to be specifically for infants and children less than 4 years or age shall bear nutrition labeling, except that such labeling shall not include listings of percent of Daily Value and the footnote required in paragraphs (d)(7), (d)(9), and (d)(10) of this section. Nutrient names and quantitative amounts by weight shall be presented in two separate columns.

(6) Dietary supplements of vitamins and minerals except that the labeling of a dietary supplement of vitamins and minerals in conventional food form, e.g., a breakfast cereal, shall conform to the labeling established in this section.

(7) Infant formula subject to section 412 of the act, as amended, except that such foods shall be labeled in compliance with part 107 of this chapter.

(8) Medical foods as defined in section 5(b) of the Orphan Drug Act (21 U.S.C. 360ee(b)(3)). A medical food is a food which is formulated to be consumed or administered enterally under the supervision of a physician and which is intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation. A food is subject to this exemption only if:

(i) It is a specially formulated and processed product (as opposed to a naturally occurring foodstuff used in its natural state) for the partial or exclusive feeding of a patient by means of oral intake or enteral feeding by tube;

(ii) It is intended for the dietary management of a patient who, because of therapeutic or chronic medical needs, has limited or impaired capacity to ingest, digest, absorb, or metabolize ordinary foodstuffs or certain nutrients, or who has other special medically determined nutrient requirements, the dietary management of which cannot be achieved by the modification of the normal diet alone;

(iii) It provides nutritional support specifically modified for the management of the unique nutrient needs that result from the specific disease or condition, as determined by medical evaluation;

(iv) It is intended to be used under medical supervision; and

(v) It is intended only for a patient receiving active and ongoing medical supervision wherein the patient requires medical care on a recurring basis for, among other things, instructions on the use of the medical food.

(9) Food products shipped in bulk form that are not for distribution to consumers in such form and that are for use solely in the manufacture of other foods or that are to be processed, labeled, or repacked at a site other than where originally processed or packed.

(10) Raw fruits, vegetables, and fish subject to section 403(q)(4) of the act, except that the labeling of such foods should adhere to guidelines in § 101.45. The term "fish" includes freshwater or marine fin fish, crustaceans, and mollusks, including shellfish, amphibians, and other forms of aquatic animal life.

(11) Packaged single-ingredient products that consist of fish or game meat (i.e., animal products not covered under the Federal Meat Inspection Act or the Poultry Products Inspection Act, such as flesh products from deer, bison, rabbit, quail, wild turkey, or ostrich) subject to this section may provide required nutrition information for a 3-ounce cooked edible portion (i.e., on an "as prepared" basis), except that:

(i) Such products that make claims that are based on values as packaged must provide nutrition information on an as packaged basis, and

(ii) Nutrition information is not required for custom processed fish or game meats.

(12) Game meats (i.e., animal products not covered under the Federal Meat Inspection Act or the Poultry Products Inspection Act, such as flesh products from deer, bison, rabbit, quail, wild turkey, or ostrich) may provide required nutrition information on labeling in accordance with the provisions of paragraph (a)(2) of this section.

(13)(i) Foods in small packages that have a total surface area available to bear labeling of less than 12 square inches, *Provided,* That the labels for these foods bear no nutrition claims or other nutrition information. The manufacturer, packer, or distributor shall provide on the label of packages that qualify for and use this exemption an address or telephone number that a consumer can use to obtain the required nutrition information (e.g., "For nutrition information, call 1–800–123–4567").

(ii) Foods in packages that have a total surface area available to bear labeling of 40 or less square inches may modify the requirements of paragraphs (c) through (f) and (i) of this section by one or more of the following means:

(A) Presenting the required nutrition information in a tabular or, as provided below, linear (i.e., string) fashion rather than in vertical columns if the product has a total surface area available to bear labeling of less than 12 square inches or if the package shape or size cannot accommodate a column display on any label panel. Nutrition information may be given in a linear fashion, only if the label will not accommodate a tabular display, and, in that case, any subcomponents declared shall be listed

parenthetically after principal components (e.g., saturated fat shall be declared in parentheses after total fat).

The following sample label illustrates a tabular display.

BILLING CODE 4160-01-M

BILLING CODE 4160-01-C

(B) Using any of the following abbreviations:
Serving size—Serv. size
Servings per container—Servings
Calories from fat—Fat cal
Saturated fat—Sat fat
Cholesterol—Cholest
Total carbohydrate—Total carb
Dietary fiber—Fiber

(C) Omitting the footnote and caloric conversion information required in paragraphs (d)(9) and (d)(10) of this section and placing another asterisk at the bottom of the label followed by the statement "Percent Daily Values are based on a 2,000 calorie diet" and, if the term "Daily Value" is not spelled out in the heading, a statement that "DV" represents "Daily Value."

(D) Presenting the required nutrition information on any label panel.

(14) Shell eggs packaged in a carton that has a top lid designed to conform to the shape of the eggs are exempt from outer carton label requirements where the required nutrition information is clearly presented in no less than 1/16-inch type size immediately beneath the carton lid or in an insert that can be clearly seen when the carton is opened.

(15) The unit containers in a multiunit retail food package where:

(i) The multiunit retail food package labeling contains all nutrition information in accordance with the requirements of this section;

(ii) The unit containers are securely enclosed within and not intended to be separated from the retail package under conditions of retail sale; and

(iii) Each unit container is labeled with the statement "This Unit Not Labeled For Retail Sale" in type size not less than 1/16-inch in height. The word "individual" may be used in lieu of or immediately preceding the word "Retail" in the statement.

(16) Food products sold from bulk containers: *Provided,* That nutrition information required by this section be displayed to consumers either on the labeling of the bulk container plainly in view or in accordance with the provisions of paragraph (a)(2) of this section.

(k) A food labeled under the provisions of this section shall be deemed to be misbranded under sections 201(n) and 403(a) of the act if its label or labeling represents, suggests, or implies:

(1) [Reserved]

(2) That a balanced diet of ordinary foods cannot supply adequate amounts of nutrients.

(3) That the lack of optimum nutritive quality of a food, by reason of the soil on which that food was grown, is or may be responsible for an inadequacy or deficiency in the quality of the daily diet.

(4) That the storage, transportation, processing, or cooking of a food is or may be responsible for an inadequacy or deficiency in the quality of the daily diet.

(5) That the food has dietary properties when such properties are of no significant value or need in human nutrition.

(6) That a natural vitamin in a food is superior to an added or synthetic vitamin or to differentiate in any way between vitamins naturally present from those added.

5. Section 101.100 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 101.100 Food; exemptions from labeling.

* * * * *

(d) Except as provided by paragraphs (e) and (f) of this section, a shipment or other delivery of a food which is, in accordance with the practice of the trade, to be processed, labeled, or repacked in substantial quantity at an establishment other than that where originally processed or packed, shall be exempt, during the time of introduction into and movement in interstate commerce and the time of holding in such establishment, from compliance with the labeling requirements of section 403 (c), (e), (g), (h), (i), (k), and (q) of the act if:

* * * * *

6. Appendix B to Part 101 is added to read as follows:

BILLING CODE 4160-01-M

Appendix B to Part 101

Graphic Enhancements used by the FDA

A.Overall

1. Nutrition Facts Label is boxed with all black or one color type printed on a white or neutral ground.

B. Typeface and size

1. The "Nutrition Facts" label uses 6 point or larger Helvetica Black and/or Helvetica Regular type. In order to fit some formats the typography may be kerned as much as -4, (tighter kerning reduces legibility).
2. Key nutrients & their % Daily Value are set in 8 point Helvetica Black (but "%" should be set in Helvetica Regular).
3. "Nutrition Facts" is set in either Franklin Gothic Heavy or Helvetica Black to fit the width of the label flush left and flush right.
4. "Serving Size" and "Servings per container" are set in 8 point Helvetica Regular with 1 point of leading.
5. The table labels (for example; "Amount per Serving") are set 6 point Helvetica Black.
6. Absolute measures of nutrient content (for example; "1g") and nutrient subgroups are set in 8 point Helvetica Regular with 4 points of leading.
7. Vitamins and minerals are set in 8 point Helvetica Regular, with 4 points of leading, separated by 10 point bullets.
8. All type that appears under vitamins and minerals is set in 6 point Helvetica regular with 1 point of leading.

C. Rules

1. A 7 point rule separates large groupings as shown in example. A 3 point rule separates calorie information from the nutrient information.
2. A hairline rule or 1/4 point rule separates individual nutrients, as shown in the example. Descenders should not touch rule. The top half of the label (nutrient information) has 2 points of leading between the type and the rules, the bottom half of the label (footnotes) has 1 point of leading between the type and the rules.

D. Box

1. All labels are enclosed by 1/2 point box rule within 3 points of text measure.

RIN 0905–AD08

Food Labeling; Reference Daily Intakes and Daily Reference Values

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending its regulations to establish two sets of label reference values, Reference Daily Intakes (RDI's) and Daily Reference Values (DRV's), for use in declaring the nutrient content of a food on its label or labeling. FDA intends to use these two sets of values as a single set of label reference values known as the Daily Value, which will assist consumers in understanding the relative significance of the information about the amount of certain nutrients in a food in the context of a total daily diet. It will also assist consumers in comparing the nutritional values of food products.

EFFECTIVE DATE: May 8, 1994.

FOR FURTHER INFORMATION CONTACT: Christine Lewis, Center for Food Safety and Applied Nutrition (HFS–165), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–5588.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of July 19, 1990 (55 FR 29476), FDA published a proposed rule entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" (the July 1990 proposal) to amend its food labeling regulations by revising and expanding label reference values for nutrients in foods. In the Federal Register of November 27, 1991 (56 FR 60366, and corrected at 57 FR 8178, March 6, 1992), FDA issued a document entitled: "Food Labeling: Reference Daily Intakes and Daily Reference Values; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" (hereinafter referred to as the "supplementary proposal") to supplement and to republish, in modified form, the July 1990 proposal. The agency proposed to: (1) Replace the current label reference values known as "U.S. Recommended Daily Allowances" (U.S. RDA's) with RDI's; (2) provide RDI's for five groups: adults and children 4 or more years of age, children less than 4 years of age, infants, pregnant women, and lactating women; (3) establish RDI's for protein and 26 vitamins and minerals for all five groups; and (4) establish DRV's for adults and children 4 or more years of age for eight nutrients and food components considered important to the maintenance of good health. FDA requested comments on the proposed regulation. Interested persons were given until February 25, 1992, to comment.

FDA received approximately 800 responses to the July 1990 proposal and approximately 700 responses to the supplementary proposal, each of which contained one or more comments, from trade and retail associations, government organizations, retailers, consumer groups, State groups, private organizations, professional societies, and universities. Many comments suggested modification and revision of various provisions of the proposal. A summary of the suggested changes and the agency's responses follows.

On October 6, 1992, Congress passed the Dietary Supplement Act of 1992 (hereinafter referred to as the "DS Act" that, in section 203, instructed FDA to not promulgate regulations that require the use of, or are based upon, recommended daily allowances of vitamins or minerals before November 8, 1993, (other than regulations establishing the United States recommended daily allowances specified in 21 CFR 101.9(c)(7)(iv) as in effect on October 6, 1992).

II. Authority for New Label Reference Values

A. RDI's: Revision of U.S. RDA's

1. Several comments suggested that the change from the current label reference values, the U.S. RDA's, to the proposed new label reference values, the RDI's, was not mandated by the Nutrition Labeling and Education Act of 1990 (Pub. L. 101–535) (the 1990 amendments), and that retaining the U.S. RDA's is not inconsistent with the amendments.

FDA agrees that the 1990 amendments do not require that the U.S. RDA's be changed. The agency points out, however, that section (2)(b)(1)(A) of the 1990 amendments (21 U.S.C. 343 note) does require that the required nutrition label information be conveyed in a manner that enables the public to readily observe and comprehend the information and to understand its relative significance in the context of a total daily diet. Such information should be consistent with current scientific knowledge about nutrients and health.

Over the last 20 years, there have been significant advances in scientific knowledge with respect to essential nutrient requirements. In 1989, the National Academy of Sciences (NAS) updated the Recommended Dietary Allowances (RDA's)—the basis for label reference values derived by the agency—to include for the first time RDA values for vitamin K and selenium and to make significant revisions in the allowances for several nutrients, including vitamin B_6, folate (folic acid), vitamin B_{12}, magnesium, iron, and zinc. In addition, scientific advances permitted NAS to substantively revise values for the listing known as "Estimated Safe and Adequate Daily Dietary Intakes" (ESADDI's). The ESADDI's published in 1989 include revised values for three nutrients (biotin, pantothenic acid, and copper) for which FDA established U.S. RDA's in 1973 as well as new values for manganese, fluoride, chromium, and molybdenum.

Based on these considerable changes in scientific knowledge, FDA tentatively determined that it was appropriate to revise the current U.S. RDA's to be more consistent with newer data on nutrient allowances. FDA attempted in this food labeling initiative to base its actions on the most current scientific and public health knowledge. Continuing to base label reference values on a 1968 standard would be inconsistent with such an approach and would not appropriately assist consumers in understanding the nutrition label information relative to a total daily diet. However, based on the provisions of the DS Act, the agency is, in this rulemaking, retaining the current label reference values, the U.S. RDA's as established in 21 CFR 101.9(c)(7)(iv). As discussed in section III below, the terminology used to designate label reference values for vitamins and minerals is being changed however.

The label reference values in current § 101.9(c)(7)(iv) will be referred to, in this document and in companion documents published elsewhere in this issue of the Federal Register, as "Reference Daily Intakes" (RDI's). As specified by the DS Act, the agency will promulgate final regulations on label reference values for vitamins and minerals after November 8, 1993. The agency will consider any further information submitted or obtained in the interim in reaching a decision on the form and substance of such final regulations.

B. DRV's: New Label Reference Values for Nutrientsof Public Health Concern

2. A few comments suggested that establishing DRV's was beyond the authority granted by the 1990 amendments.

The majority of comments supported the concept of establishing a DRV. These comments were provided by consumers, health professionals, and trade representatives. Several comments specifically highlighted the DRV's as an invaluable addition to nutrition labeling, as a labeling component that is important to the idea of the relative contribution of a food to the total day's recommended amount of a nutrient, and as a way to decrease confusion among consumers.

FDA disagrees that the establishment of DRV's is inconsistent with the 1990 amendments. The agency proposed this new set of label reference values in 1990 in an attempt to address current concerns about information on food components that have an important bearing on diet and health. With the passage of the 1990 amendments, the agency also recognized that these values respond to the directive in the legislation that the information required in the nutrition label be conveyed to the public in a manner that enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet (section 2(b)(1)(A) of the 1990 amendments).

FDA does not believe that merely listing the quantitative amount of nutrients such as fat and fiber on the nutrition label will adequately allow consumers to understand the significance of the amount of the nutrient in the food in the context of the total daily diet or to understand the nutrition information pertaining to that food in relation to recommended daily intakes of the food component. FDA found in focus group discussions that it conducted as part of its research on label format that many persons could not specify the recommended intakes for nutrients such as sodium, even when they indicated that the nutrient was important to their health and were concerned about their intake of the nutrient (Ref. 29).

Moreover, contrary to the assertion in some of the comments, the use of DRV's was clearly contemplated by Congress. In discussing section 2(b)(1)(A) of the 1990 amendments, the House report states:

> In order to present nutrition information in a manner that facilitates the public's understanding, the Secretary may choose among a variety of options. For example, one way that this could be accomplished would be to include information about the recommended daily intake on the label. (Ref. 19, p. 18)

Therefore, for the foregoing reasons and consistent with the majority of the comments, FDA concludes that DRV's provide an appropriate approach to accomplishing the statutory mandate and are fully consistent with the authority extended to the agency by the 1990 amendments. Significantly, consumers are becoming more aware of diet/health interrelationships and have expressed growing interest in the inclusion of information about food components on labels to help them determine how individual foods fit within general recommendations for a total daily diet. Additionally, "Healthy People 2000: National Health Promotion and Disease Prevention Objectives" (Ref. 30) proposes that there be an increase in nutrition labeling that provides information to facilitate choosing foods consistent with the Dietary Guidelines for Americans published jointly by the U.S. Department of Agriculture (USDA) and the U.S. Department of Health and Human Services (DHHS). The DRV's will be an important tool for this purpose.

III. RDI'S: Label Reference Values for Vitamins and Minerals

A. Terminology

3. Several comments expressed concerns about consumer confusion if the more familiar U.S. RDA term was replaced with a new term. These comments generally suggested that the term "U.S. RDA" be retained and used on the label in order to reduce consumer confusion. One comment argued that while the agency asserts that the term "U.S. RDA" is too confusing, FDA cited no evidence of this confusion.

A number of other comments supported eliminating the term "U.S. RDA." One health professional stated that even professionals fail to make the distinction between the RDA established by NAS and the U.S. RDA. A food company stated that it frequently encountered expressions of confusion from consumers and professionals alike over the difference between the U.S. RDA and the NAS RDA. An association of nutrition educators agreed that a change in terminology is needed in order to reduce consumer confusion surrounding the distinction between RDA's and U.S. RDA's. Several comments specifically supported the term "RDI." One comment stated that the use of terminology that differentiates between reference standards used for nutrition labeling and the RDA established by NAS should be beneficial to the consumer.

In 1973, FDA created label reference values known as "U.S. RDA's" and based them on the "Recommended Dietary Allowances," 7th ed., 1968 (the NAS RDA publication) (Ref. 27). As stated in the proposal for this final rule, FDA believes that the term "U.S. RDA" can easily be confused with "RDA," and that this confusion presents difficulties both in consumer education and professional communication (55 FR 29476 at 29478). The comments received have supported the need for a change in terminology, and FDA agrees that because of the potential for confusion a change in terminology is appropriate. FDA notes that in the comments submitted in response to this proposal, the agency found numerous examples of confusion and inappropriate interchange concerning the two terms.

Additionally, the agency advises that consumers will not be confused by the change from U.S. RDA to RDI because the term will not appear on the food label. The RDI's, which refer to label reference values for vitamins and minerals only, will not be used on the food label because a new more comprehensive term will be used, a term that includes label reference values for DRV's as well as RDI's. The provision for a single term ("Daily Value") is discussed in more detail in a companion document entitled "Food Labeling: Mandatory Status of Nutrition Labeling and Nutrient Content Revision" (hereinafter referred to as "Mandatory Nutrition Labeling final rule"), published elsewhere in this issue of the **Federal Register**.

As discussed in this companion document, the decision to use a single term is based on the fact that the nutrition label will contain label reference values for nutrients other than those with NAS RDA's (e.g., total fat). Clearly, the term "RDI" cannot be used to generally refer to all the new label reference values because it implies that all values are based on the NAS RDA. In fact, less than half of the mandatory components of the nutrition label will be nutrients with a NAS RDA. The agency also believes that it would be needlessly confusing to consumers if the two terms were used on the food label. Consumers are expected to perceive the label reference values as a single overall set of values. Therefore, to reduce consumer confusion, FDA has decided to choose a new term to denote the combined set of label reference values, a term that refers to both RDI's and DRV's.

The distinction between RDI and DRV nutrients remains necessary for regulatory purposes because the values were derived from separate sources and because these nutrients play different roles under the imitation and substitute food regulations. However, there is no need to make consumers aware of the regulatory distinction between RDI and DRV. Rather, educational efforts will focus on the overall set of label reference values.

4. Several comments suggested that FDA delay selecting terminology for the food label until consumer research can be completed.

While FDA supports and recognizes the value of consumer research, the time constraints placed on the agency by the 1990 amendments and the clear need to provide for the label terminology at the time of final rules, preclude the possibility of extensive consumer research. The terminology specified in these final rules derives from available information.

During the Fall of 1990, FDA conducted focus group research that included some discussions of terminology (Ref. 29). The sessions suggested that the term for the overall label reference value (proposed as "Daily Value") could be problematic, yet better terms for this or any other label reference values did not emerge during these sessions. The agency requested in the supplementary proposal (56 FR 60366) that persons submit available research, information, or suggestions concerning terminology. FDA has reviewed the relevant comments and they are discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**. Based on these comments, as explained in the Mandatory Nutrition Labeling document, FDA has decided to use the term "Daily Value" to refer to the combined set of label reference values.

5. Two comments suggested that the proposed term "RDI" created consumer confusion by continuing to use the letters R and D in some combination, and that "RDI" was too similar to "U.S. RDA" and "RDA." Another comment suggested that to avoid confusion with the previous U.S. RDA terminology, the term "recommended" be retained and used instead of the term "reference."

FDA acknowledges that the inclusion of the letters R and D in RDI may have the potential to cause consumer confusion relative to U.S. RDA. However, because the term will not be used either on the food label or in most consumer education programs, the agency rejects this argument as a basis to abandon a term that accurately reflects the fact that the value it denotes represents a point of reference rather than a specific recommended intake level for individuals. Therefore, FDA has retained the term "RDI" to denote those nutrients whose label reference values have been derived from the NAS RDA's and ESADDI's.

6. One comment requested that FDA work with the European Economic Community and Codex Alimentarius to establish compatible nomenclature whenever possible.

FDA agrees with this suggestion and will, in its ongoing labeling activities, attempt to harmonize with international terminology as much as possible. However, within the time constraints of the 1990 amendments, the agency finds that it must make a unilateral decision concerning terminology.

B. Use of the 1989 NAS RDA's as the Basis for Label Reference Values

In 1973, FDA created label reference values known as U.S. RDA's and based them on the 7th edition of the NAS RDA publication (Ref. 27). At that time, comments supported the use of a single set of values derived from the NAS RDA's. In the July 1990 proposal (55 FR 29476) and again in the supplementary proposal (56 FR 60366), FDA proposed to revise the U.S. RDA's using the 1989 NAS RDA's (Ref. 26). This section responds to the comments that addressed the continued use of the NAS RDA's as the basis for developing label reference values for vitamins and minerals, as well as the appropriateness of using the most current NAS RDA's (i.e., the 10th edition of the NAS RDA publication (1989)), for this purpose.

7. The majority of comments on this topic, primarily from health professionals and the food industry, supported the continued use of the NAS RDA's as the basis for developing label reference values for vitamins and minerals. These comments also supported the desirability of updating the current label reference values (U.S. RDA's) to be consistent with the most recent edition (i.e., 1989) of the NAS RDA's. Numerous comments stated that revisions to the values were long overdue given the fact that changes had not been made by FDA since it developed the label reference values in 1973 based on the 1968 NAS RDA's. Comments urged FDA to continue to review and update label reference values as advances in scientific data lead to significant changes in the NAS RDA's. One comment requested that FDA establish an official mechanism in the final rule to provide for regular updates of label reference values.

FDA tentatively agrees with the appropriateness of continuing to rely on the NAS RDA's as the basis for label reference values. Strong and uniform support was provided for the use of NAS RDA's during the initial development of label reference values in 1972. As evidenced by the comments to the current proposal, this support remains. The agency believes that these established nutrient allowances remain the most widely accepted and respected source of information on human nutrient requirements and recommended intakes. FDA also notes that the preface to the 1989 edition of the NAS RDA's (Ref. 26) states that the RDA's reflect a concurrence of scientific opinion and will be appropriate for use by governmental and private agencies as a basis for developing nutrition programs and policies pertaining to public health. In general, the comments submitted in this rulemaking agreed with this statement. FDA therefore, has tentatively concluded that the label reference values (formerly known as U.S. RDA's, now RDI's) should be based on the 1989 NAS RDA's. However, based on the provisions of the DS Act and as discussed above, the agency is, for the time being retaining the current label reference values as established in § 101.9(c)(7)(iv) and will reach a final decision on the issue of the appropriate reference values for vitamins and minerals following the provisions of the DS Act.

8. One comment suggested that the agency's reliance on the NAS RDA values raises questions under the Administrative Procedure Act. According to this comment, the NAS RDA report has been developed under closed processes and thus the use of such reports may not be appropriate for rulemaking. Another comment submitted by a health professional on behalf of 40 other health professionals suggested that any future replacement of the labeling standard should be developed by the nutrition and public health community, through an open and scientifically sound process conducted by FDA, USDA, and other relevant Federal agencies.

FDA does not agree with the comment that use of the NAS RDA's as the basis for the RDI's is inconsistent with the requirements of the Administrative Procedure Act. The NAS RDA's were developed under a National Institutes of Health (NIH) contract and are based on nutrient intake measurements, nutrient balance studies, experimental intake studies, biochemical measurements, epidemiological observations of nutrient status, and extrapolation of data from animal experiments. Furthermore, as

part of the contract, public meetings were held which afforded opportunity for public input into the development of the NAS RDA's. Additionally, the NAS subjected the draft of the RDA publication to outside review by qualified experts.

More importantly, while the NAS RDA's served as the starting point for the RDI's, FDA developed its proposal based on its review of the NAS RDA's, its views on the relevant science, and its tentative conclusions about how to turn the NAS RDA's into RDI's. Moreover, the agency subjected its proposed approach to public comment (55 FR 29476 and 56 FR 60366). In reviewing the comments that it received, FDA was open to any evidence that values other than those derived from the NAS RDA's would provide a more appropriate starting point in developing values that will place the information required to appear on the nutrition label into the context of a total daily diet. No such evidence was submitted. Thus, FDA tentatively finds that the NAS RDA's provide a scientifically valid starting point from which to develop the RDI's. As stated above, FDA will reach a final decision on the appropriate reference values for vitamins and minerals in accordance with the DS Act.

9. One comment suggested that the NAS RDA's are of questionable value for developing RDI's because NAS RDA's are reflective of diets that people actually eat without showing signs of deficiency, rather than being based on the recommended diets that people should eat according to government authorities. Several comments suggested that the NAS RDA's are designed to avoid deficiency diseases and are not the optimal levels to prevent chronic diseases. A few comments suggested that the NAS RDA's (and resulting label reference values) are inconsistent with current dietary guidance.

As stated in the "Summary" section of the 10th edition of the NAS RDA publication (Ref. 26), the NAS RDA's are based not only on data from nutrient intake measurements but also on information from nutrient balance studies, experimental intake studies, biochemical measurements, epidemiological observations of nutrient status, and extrapolation of data from animal experiments. The NAS RDA's reflect scientific judgment on nutrient allowances for the maintenance of good health. Their purpose is not just to prevent nutrient deficiency but also to meet nutrient needs for good health (Ref. 26).

Available government reports have stressed the importance of healthy dietary patterns and increased consumption of certain food categories and food components rather than quantitative recommendations for intake, especially for vitamins and minerals (Refs. 2, 3, and 5). FDA is not aware of any Federal government-issued quantitative recommendations for the general public for a vitamin or mineral that surpasses the levels specified by the NAS RDA's with the exception of 1,500 milligrams (mg) calcium for postmenopausal women suggested as a result of a 1984 consensus conference sponsored by NIH (Ref. 31) and, very recently, a PHS recommendation that women of childbearing age consume 400 µg/day of folate (Ref. 40). NIH republished the report of this conference in 1986 with the following caveat: "It has not yet been proven by convincing scientific evidence that a high calcium intake will prevent osteoporosis" (Ref. 31). This qualification reflected the results of studies that failed to show that calcium intakes above the NAS RDA slowed bone loss in postmenopausal women (Refs. 31 through 34).

Furthermore, the major consensus report Diet and Health (Ref. 3), which is an important summary of the current science on the relationship between diet and chronic disease, does not offer quantitative intakes for vitamins and minerals for the purpose of reducing the risk of chronic disease. Instead, it states that it is advisable to use the NAS RDA's in combination with the dietary recommendations in planning optimal diets to attain maximal benefit. This view is echoed in the 10th edition of the NAS RDA publication (Ref. 26), which states that the RDA's and the recommendations specified in Diet and Health should be considered together in planning appropriate diets.

Therefore, FDA concludes that the NAS RDA's are consistent with, as well as necessary for, implementation of current dietary recommendations. As such, NAS RDA's can be considered to be an appropriate basis for developing label reference values (i.e., RDI's) for nutrition labeling of foods.

10. Two comments stated that while it is reasonable for FDA to begin to develop new label reference values based on the most current NAS RDA's, FDA should not necessarily limit label reference values to only those values derived from the NAS RDA's because the most current NAS RDA's are derived from data available 3 or more years ago. Therefore, these comments suggested that rather than adopting the 1989 NAS RDA's as the sole basis for setting label reference values for vitamins and minerals, FDA should consider the totality of evidence for each nutrient. Another comment suggested that FDA, as a well-qualified, scientifically-based agency, should conduct its own reviews, if for no other reason than to be sure that the latest data are encompassed in its rulemaking.

FDA is aware that it is desirable to base label reference values on the most current scientific data. However, the existence of data from recently completed or ongoing studies does not necessarily mean that there is scientific agreement or consensus that these data require changes in the NAS RDA, or that these data render the NAS RDA invalid. FDA believes that, should scientific consensus shift or compelling evidence of a need for change in the RDI's be presented to the agency, its rulemaking procedures are sufficiently flexible to allow for timely and appropriate changes to label reference values.

In this rulemaking, FDA tentatively concludes that the NAS RDA's provide an appropriate starting point for the values that it is adopting. FDA will reach a final decision in this matter in accordance with the provisions of the DS Act.

11. One comment from a consumer organization suggested that 1989 NAS RDA values for certain nutrients (vitamin D, vitamin B_{12}, and vitamin B_6) are too low for older persons, and that this, in turn, results in label reference values that are too low. The comment urged FDA to consider basing the reference values for certain nutrients on the NAS RDA's in the 1980 edition which are higher than the 1989 NAS RDA's, and thus, according to the comment, provide greater protection to older citizens. Furthermore, two comments specifically expressed concern for the nutriture of the elderly relative to the 1989 NAS RDA's for vitamin B_{12} because these values are lower than the 1980 NAS RDA's. The comments suggested that FDA retain the current U.S. RDA value of 6 micrograms (µg) rather than adopting the 1989 NAS RDA's as the basis for the RDI's.

FDA does not agree that it is necessary to use the 1980 rather than the 1989 NAS RDA's for certain nutrients because of nutritional risk relative to older persons. The comment provided no specific evidence to support the statement that the 1989 values are too low for this segment of the population. FDA notes that the discussion provided in the 1989 NAS RDA publication clearly reveals that the development of the NAS RDA's took into consideration available evidence on nutrient levels needed by the elderly.

FDA further notes that the 1980 NAS RDA for vitamin D for persons 51 or more years of age is the same as the

1989 NAS RDA for vitamin D. While the 1989 NAS RDA's for vitamins B_1 and B_6 are lower, they are the result of a systematic lowering for all persons, not just those over 51 years of age. The 1989 NAS RDA publication cites decisions on the desirability of maintaining a substantial body pool of the vitamin as the reason for the change for vitamin B_{12} relative to 1980 levels, and the need to correct the figure for mg per gram (g) of protein as the basis for the change in vitamin B_6. Thus, FDA finds that this comment does not provide any basis for changing the agency's approach in calculating the RDI's.

Finally, FDA does not agree that concerns for vitamin B_{12} nutriture among the elderly require that the agency retain the U.S. RDA value for vitamin B_{12} (which is based on the 1968 NAS RDA's). FDA notes that the discussion in the 1989 NAS RDA publication (Ref. 26) clearly states that the NAS RDA's are based on consideration of the available evidence on the nutrient needs of older persons. In fact, an allowance is specified for persons 51 or more years of age.

Furthermore, the discussion on vitamin B_{12} in the NAS RDA publication (Ref. 26) specifically addresses the issue of vitamin B_{12} nutriture and the elderly. The text states that the results of various surveys have shown that although serum vitamin B_{12} levels decline in the elderly, they tend to remain in the normal range. The evidence suggests that the decline in the serum level is the result of the gradual appearance among the elderly of vitamin B_{12} malabsorption. As stated in the NAS RDA report (Ref. 26), such malabsorption would require injection of vitamin B_{12}, rather than an increase in the allowance or, by implication, the label reference value. Therefore, the agency's tentative view is that the need for an increased RDI relative to the issues of malabsorption cannot be supported.

However, based on the provisions of the DS Act, the agency is, for the time being, retaining the current label reference values as established in current § 101.9(c)(7)(iv) and will reach a final decision on this issue following the provisions of the DS Act.

C. Use of a Population-Adjusted Mean of the NAS RDA's to Derive RDI's for Vitamins and Minerals

The NAS RDA for a vitamin or mineral is established for each of approximately 18 age and sex categories. When FDA created the label reference values known as U.S. RDA's in 1973, it concluded that it was most practical to develop a single label reference value for each nutrient for the purposes of food labeling. Generally, the agency selected the highest NAS RDA value (for persons 4 or more years of age excluding pregnant and lactating women) to serve as the U.S. RDA. In July of 1990 and again in November of 1991, FDA proposed to replace the approach of generally selecting the highest NAS RDA value with an approach that averages the NAS RDA values for the various age/sex categories and adjusts the average for differences in population size of the age/sex groups. This section deals with the comments that addressed the proposed change in approach used to calculate label reference values for those vitamins and minerals based on NAS RDA's.

The use of a population-adjusted average (or mean) of NAS RDA's was the major issue addressed by many commenting on the proposal. Several health professional groups and food industry representatives supported the use of an averaged value as the label reference values for vitamins and minerals. However, the majority of comments urged FDA to abandon the averaging approach and to continue to use the approach of selecting the highest NAS RDA value as the label reference value. A wide range of persons submitted comments supporting this view, including health professionals, industry representatives, and consumers. Many of the comments from consumers were variations of a form letter that opposed the change but did not provide a substantive rationale for the position expressed.

12. A few comments opposing use of averaged values raised the concern that lower label reference values would downgrade the nutritional quality of fortified and substitute foods. Some comments asserted that a change in label reference values would affect FDA food fortification practices or the nutrient content of food assistance programs. Other comments expressed concern that the approach changed the label reference values by as much as 80 percent.

The agency notes that many comments concluded that the difference (i.e., lower values) between the current label reference values (U.S. RDA's) and the proposed label reference values (RDI's) could be attributed solely to the change in the approach used to calculate the values. The comments were incorrect. The proposed approach lowered the label reference values for vitamins and minerals by an average of about 14 percent compared to values that would have been derived if the agency had used the approach of selecting the highest 1989 NAS RDA value, i.e., the traditional approach with the most recent NAS RDA values. The remaining differences are the result of changes in the NAS RDA values from 1968 to 1989. In the 10th edition of the NAS RDA publication, NAS lowered several of its RDA values compared to the 1980 or earlier NAS RDA values to reflect new evidence in nutrition science and advances in analytical methodology. Thus, regardless of which approach had been used with the 1989 NAS RDA's—either the population adjusted mean approach or the approach of selecting the highest NAS RDA value—the resulting revised label reference values would be lower when compared to the existing U.S. RDA's.

FDA further advises that label reference values are not used in the agency's policies on nutrient fortification. Some foods must be fortified to meet standards of identity, nutrition quality guidelines, substitute food regulations, or infant formula regulations. Moreover, FDA's guidelines on food fortification (§ 104.20 (21 CFR 104.20)) recommend that nutrients be added on the basis of specific quantities for a given amount of food. The levels are based on the needs of those segments of the population that are at risk of deficiency of those nutrients and not on the U.S. RDA's.

FDA's fortification policy states that traditional foods will be fortified if there is a public health need, or if nutrients need to be restored to a particular food, for example, if they are depleted during processing. Fortification of foods not covered by this policy is at the discretion of the manufacturer. The agency acknowledges that it is common practice for some manufacturers to fortify to a specific percentage of the label reference value (e.g., 25 percent). To the extent that this practice is continued, nutrient levels in some foods could be affected by changes in label reference values. However, this practice does not derive in any way from FDA regulations.

FDA also advises that the current label reference values (U.S. RDA's) have never served as standards for food packages or meal patterns for government feeding programs such as the Food Stamp Program, the Special Supplemental Food Program for Women, Infants and Children (WIC), or the National School Lunch Program and other child-feeding programs. There is one reference to U.S. RDA's in the regulations governing the National School Lunch Program, but it is merely used to determine whether certain foods—such as some snack food items that do not contain meaningful levels of nutrients—can be sold near or in school

cafeterias in competition with the school lunch program (7 CFR 210.11). The food packages and meal patterns used by these programs are based on the specific NAS RDA for each program's targeted group or include foods that contain required amounts of nutrients per unit. Thus, much of the comment that opposed the use of the averaging approach was significantly misinformed in several important respects.

13. The most frequent concern expressed in the comments that opposed the averaging approach was that the approach resulted in a value that was too low for at least half of the population, and that these lower values will result in suboptimal nutrient intakes. Many commented that consumers should be assured that if they meet 100 percent of the label reference value, they are meeting or exceeding their own individual allowances. Some were concerned that for certain nutrients, such as calcium, for which health authorities are emphasizing maximum intakes within a target population group, a label reference value based on an average undermines these dietary guidance efforts. Several comments argued that health educators have invested years in teaching consumers about the use and interpretation of the current label reference value (U.S. RDA), and that the proposed change would consequently cause consumer confusion as well as erase educational inroads. One professional commented that the label reference value should not provide guidance about what amount a person should consume; rather, its purpose is to provide values that allow comparative shopping. However, according to the comment, if a single value is to be used as a guide for nutritional adequacy, the first principle of public health should be followed, which is to aim at the most vulnerable group. Several comments provided data or reviews of studies linking nutritional deficiencies or suboptimal intakes with a range of adverse effects from learning disabilities to cataracts.

FDA is persuaded by the comments that the proposed averaging approach should be modified. To understand the modified approach some background discussion is necessary.

The agency has always viewed the food label as an important tool for informing consumers about the nutritional content of the foods that they buy—one that shoppers can use to compare the vitamins, minerals, and protein in one food with another. This view is reinforced by the 1990 amendments. Additionally, the agency has been concerned that label reference values be set at levels consistent with levels of nutrients found naturally in foods so that regular, unfortified foods do not appear to be less than nutritious. If regular, unfortified foods were to appear less than nutritious, this could encourage needless fortification of foods.

Furthermore, FDA has also been concerned that the label reference values that appear on food labels not be interpreted as recommended intakes for individuals. Given the limited nutrition information that can be presented within the small space of most food labels, the agency sought in the proposal to establish values that represented a population-based average that consumers could use as a reference, adjusting it upward or downward based on how they compared to the average.

Most comments agreed that nutrition information on food labels must by necessity be limited and generalized, but suggested that public health concerns as well as consumer confidence and educational goals are best served by selecting label reference values that target "vulnerable groups" or at least that provide coverage for most of the population (i.e., the highest level recommended). Comments urged FDA to select protective levels of intake for vitamins and minerals that would be compatible with health promotion and disease prevention.

One comment suggested that consumers will not necessarily distinguish between a reference intake and a recommended intake, and that FDA should assume that consumers will see label reference values as recommended intakes. This comment offered a modification of the general approach of selecting the highest NAS RDA values. According to the comment, for each nutrient FDA should choose the most vulnerable segments of the population as the basis for the RDI. This segment should be established, the comment said, by identifying the group that has the highest NAS RDA and assessing its risk of a health problem caused by inadequate intakes of the nutrient. If the group with the highest NAS RDA is not at risk, FDA should move to the group with the second highest NAS RDA and assess its risk, and so on until the agency identifies a group that is at risk, or until it reaches a group that constitutes a major portion of the population.

FDA has considered all of these comments in determining the most appropriate alternative approach. FDA finds that there is considerable and uniform support for continuing to establish a label reference value for vitamins and minerals with NAS RDA's by selecting the highest NAS RDA value from among those persons 4 or more years of age (excluding pregnant and lactating females). The comments clearly demonstrated that vulnerable or at-risk groups would be sufficiently covered by selecting the highest value. While FDA understands the intent of the comment suggesting that the agency conduct an iterative process to determine at-risk groups or vulnerable segments of the population, the broad support in the comments for the view that the highest value is sufficient to protect vulnerable groups must be taken into account. Moreover, the iterative approach could complicate the selection of label reference values, especially in situations where data are limited or subject to varying interpretations. Thus, FDA has concluded that the iterative process offers no public health advantages as compared to the approach of selecting the highest NAS RDA.

Furthermore, it is likely that the overall concern of the comment that suggested the iterative process is reasonably met by selecting the highest NAS RDA, in that the comment suggested an approach that was intended to provide coverage for a larger proportion of the population than did the proposed averaging approach. Therefore, FDA has tentatively determined that label reference values (i.e., RDI's) should be based on an approach that selects the highest NAS RDA values from among those for adults and children 4 or more years of age but excludes values for pregnant females and lactating females. FDA refers to this approach as the "population coverage approach." The label reference values that result from application of this approach to the 1989 NAS RDA's are set out in the following table:

Nutrient	Unit of measurement	Adults and children 4 or more years of age	Children less than 4 years of age[1]	Infants[2]	Pregnant women	Lactating women
Vitamin A	retinol equivalents[3]	1,000	400	375	800	1,300
Vitamin C	mg	60	40	35	70	95
Calcium	do	1,200	800	600	1,200	1,200

Nutrient	Unit of measurement	Adults and children 4 or more years of age	Children less than 4 years of age[1]	Infants[2]	Pregnant women	Lactating women
Iron	do	15	10	10	30	15
Vitamin D	µg[4]	10	10	10	10	10
Vitamin E	alpha-tocopherol equivalents[3].	10	6.0	4	10	12
Vitamin K	µg	80	15	10	65	65
Thiamin	mg	1.5	0.7	0.4	1.5	1.6
Riboflavin	do	1.8	0.8	0.5	1.6	1.8
Niacin	niacin equivalents[3]	20	9.0	6	17	20
Vitamin B_6	mg	2.0	1.0	0.6	2.2	F2.1
Folate[5]	µg	400	50	35	400	400
Vitamin B_{12}	do	2	0.7	0.5	2.2	2.6
Phosphorus	mg	1,200	800	500	1,200	1,200
Magnesium	do	400	80	60	320	355
Zinc	do	15	10	5	15	19
Iodine	µg	150	70	50	175	200
Selenium	do	70	20	15	65	75
Chloride	mg	3,400	1,000	800	3,400	3,400[1].

[1] The term "children less than 4 years of age" means persons 13 through 47 months of age.
[2] The term "infants" means persons not more than 12 months of age.
[3] 1 retinol equivalent = 1 µg retinol or 6 µg beta-carotene; 1 alpha-tocopherol equivalent = 1 mg d-alpha-tocopherol (RRR-alpha-tocopherol); 1 niacin equivalent = 1 mg niacin or 60 mg of dietary tryptophan.
[4] As cholecalciferol.
[5] Discussion of folate RDI in section III. G. (comment 21) of this document.

However, based on the provisions of the DS Act, the agency is retaining the current label reference values established in § 101.9(c)(7)(iv) (recodified as § 101.9(c)(8)(iv) and redesignated as "Reference Daily Intakes"). It should be noted, however, that there are, in current § 101.9(c)(7)(iv), no label reference values for vitamin K, selenium, or chloride. Therefore, for the time being, the agency is not establishing label reference values for these three nutrients. FDA will reach a final decision on these issues, following the provisions of the DS Act.

D. Use of the NAS ESADDI as a Basis for Establishing an RDI

14. One comment was received that suggested that the RDI's based on ESADDI's may be a risk to health because in establishing the ESADDI's, NAS has stated that the upper limits of the ranges of intake should not be habitually exceeded. The comment asserted that some of the proposed RDI's based on ESADDI's exceed the upper limits of intake for children, specifically biotin, pantothenic acid, copper, manganese, and molybdenum.

FDA disagrees that the proposed label reference values based on the ESADDI's represent a risk to children. The agency is unaware of any evidence that would suggest that consumption at the proposed levels constitutes a health risk for children. The 10th edition of the NAS RDA publication (Ref. 26) states that:

(1) There have been no reports of toxicity associated with biotin intakes as high as 10 mg/day;

(2) Evidence suggests that pantothenic acid is relatively nontoxic;

(3) Usual intakes of copper in the U.S. are between 2 and 5 mg/day which is considered safe, and occasional intakes of up to 10 mg/day are probably safe for human adults;

(4) Manganese toxicity is rare, and nearly all cases are associated with environmental exposure. While there have been reports that learning disabilities in children might be associated with increased manganese levels in hair, more evidence is required before this association can be substantiated; and

(5) While the level of dietary intake of molybdenum that is known to be associated with increased loss of copper in the urine is approximately 2-fold that of the highest ESADDI, relatively large doses are necessary to overcome homeostatic mechanisms (Ref. 35).

Chloride tolerance is very high and likely many times the proposed RDI. The 9th edition of the NAS RDA publication (Ref. 36), which provides the basis for the RDI for chloride, does not even discuss the possibility of chloride toxicity.

As for chromium, although the agency is unaware of any safety issues at levels of current consumption, FDA recognizes that the safe range of intake of this mineral is fairly narrow. Thus, until sources of chromium have been affirmed, FDA advises that the RDI for chromium should not be interpreted as a recommendation for use for either direct supplementation or adding nutrients to foods.

Finally, a label reference value for fluoride does not present issues of risk for children because it is to be used only in conjunction with a declaration of the level of this nutrient that is naturally present in a food.

Thus, the agency concludes that children eating from the general food supply are extremely unlikely to be at risk for toxic intakes of these micronutrients. To be consistent with the population coverage approach being used for other vitamins and minerals with NAS RDA's, FDA has selected the highest ESADDI within the specified age group to serve as the label reference value. If an ESADDI value is presented as a range, FDA has used the midpoint of the range as the RDI. No comments were received that objected to this approach.

FDA's approach would provide RDI's for three age groups for nutrients with ESADDI's: adults and children 4 or more years of age, children less than 4 years of age, and infants. The NAS does not provide ESADDI's for pregnant or lactating females, but, as proposed, FDA used the midpoint of the ESADDI range for adults as the basis for the RDI for pregnant and lactating women in order to provide a reasonably appropriate reference value for this population. No comments objected to this approach. The RDI's determined by the agency based on the ESADDI's are set out in the following table:

Nutrient	Unit of measurement	Adults and children 4 or more years of age	Less than 4 years of age[1]	Infants[2]	Pregnant women	Lactating women
Biotin	µg	65	20	15	65	65

Nutrient	Unit of measurement	Adults and children 4 or more years of age	Less than 4 years of age[1]	Infants[2]	Pregnant women	Lactating women
Pantothenic acid	mg	5.5	3.0	3.0	5.5	5.5
Copper	do	2.5	0.9	0.7	2.5	2.5
Manganese	do	3.5	1.3	0.8	3.5	3.5
Fluoride	do	3.0	1.0	0.6	3.0	3.0
Chromium	µg	130	50	40	130	130
Molybdenum	do	160	38	30	160	160

[1] The term "children less than 4 years of age" means persons 13 through 47 months of age.
[2] The term "infants" means persons not more than 12 months of age.

However, based on the provisions of the DS Act, the agency is retaining the current label reference values as established in § 101.9(c)(7)(iv) (recodified as § 101.9(c)(8)(iv) and redesignated as "Reference Daily Intakes"). FDA notes that, in current § 101.9(c)(7)(iv), there are no label reference values for manganese, fluoride, chromium, and molybdenum. Therefore, for the interim, the agency is not establishing label reference values for these four nutrients. FDA will reach a final decision on these issues following the provisions of the DS Act.

E. Five Sets of RDI's for Different Developmental Groups

15. One comment supported the development of RDI's for different age groups and recognition of the special needs of pregnant or lactating women. However, the comment suggested that the grouping of adults and children more than 4 years of age into a single group is not appropriate and is contrary to well established evidence that nutritional requirements vary throughout the lifecycle. On the other hand, many comments supported the agency's proposed approach.

FDA faced considerable difficulties in developing the RDI's for use on foods given that nutritional needs vary considerably among persons who will consume the foods. This issue was also a consideration in the early 1970's when FDA was promulgating its first set of label reference values known as U.S. RDA's.

Because of space constraints on the food label—a problem that is becoming ever more compelling given the mandatory requirement for nutrition labeling on most foods—FDA does not believe that a viable option exists other than to develop a single set of label reference values for most consumers of the general food supply. Clearly, children over the age of 4 years consume the same foods that the rest of the population consumes.

Further, label reference values are intended to help persons to understand the nutrient levels in the context of a total daily diet, to compare foods, and to plan general diets. They are not intended to be used to decide whether a particular individual's consumption of nutrients is appropriate. Therefore, FDA believes that no harm can be done by using a single set of label reference values for nutrition labeling, especially if appropriate nutrition education is conducted.

The agency notes that, in following the provisions of the DS Act and retaining the label reference values in current § 101.9(c)(7)(iv), there will be no label reference values codified specifically for use on foods purported to be or represented for use by infants, children under 4 years of age, or pregnant or lactating women. FDA had proposed such label reference values and had intended to include RDI's for different development groups in these final regulations.

The agency further notes that label reference values for these groups had been established in 1976, based on the 1968 NAS RDA's (41 FR 46156, October 19, 1976). These values were codified in § 125.1(b) (21 CFR 125.1(b)), later redesignated as § 105.3(b) (21 CFR 105.3(b)). In 1979, FDA in response to a decision by the Court of Appeals of the Second Circuit, revised § 105.3 by, among other things, deleting paragraph (b) (44 FR 16005, March 16, 1979). Therefore, since 1979 there have been no codified label reference values for these specific groups. However, some manufacturers have continued to use the values that were contained in § 105.3(b) for labeling products, without objections from FDA.

Thus, following the spirit of the DS Act that implies that 1968 NAS RDA's should be used for labeling purposes and to provide guidance to manufacturers, the agency is republishing, in this document, the values formerly contained in § 105.3(b). The label reference values are as follows:

Vitamins and Minerals	Units of measurement	Infants	Children under 4 years of age	Pregnant or lactating women
Vitamin A	International Units	1,500	2,500	8,000
Vitamin D	do	400	400	400
Vitamin E	do	5	10	30
Vitamin C	Milligrams	35	40	60
Folic acid	do.	1	.2	.8
Thiamine	do	.5	.7	1.7
Riboflavin	do	.6	.8	2.0
Niacin	do	8	9	20
Vitamin B_6	do	.4	.7	2.5
Vitamin B_{12}	Micrograms	2	3	8
Biotin	Milligrams	.05	15	.30
Pantothenic acid	do	3	5	10
Calcium	Grams	.6	.8	1.3
Phosphorus	do	.5	.8	1.3
Iodine	Micrograms	45	70	150
Iron	Milligrams	15	10	18
Magnesium	do	70	200	450
Copper	do	.6	1.0	2.0
Zinc	do	5	8	15

These values are to be used as guidance in the interim for labeling products purported to be or represented for use by infants, children under 4 years of age, or pregnant or lactating women. FDA will make a final decision on these issues, following the provisions of the DS act.

F. Units of Measurement

16. A dietary supplement trade association requested that the agency continue to use the International Units nomenclature for vitamins A, D, and E. The comment stated that the new equivalents nomenclature (e.g., retinol equivalents) would be confusing and is not well understood by either professionals or consumers.

FDA advises that units of measurement based on units of equivalents have been in wide use for over 15 years, and, in fact, the NAS RDA has been listed in such units since the 1980 edition. The comment cites no evidence to support the contention that professionals are confused by the nomenclature, or that consumers will necessarily be mislead. FDA believes that it is more likely that consumers will use label information to compare products, and that the agency's provision for uniform units of measurement that are consistent with current measurement practices will be most beneficial. Additionally, for many foods, specific units of measurements will not be expressed. Rather, the levels of the nutrient present will appear as a percentage of the label reference value.

However, based on the provisions of the DS Act, the agency is, for the time being, retaining the current label reference values as established in § 101.9(c)(7)(iv) (recodified as § 101.9(c)(8)(iv)), including the units of measurement contained therein. Therefore, in the interim the agency will continue to use the International Units nomenclature for vitamins A, D, and E. FDA will reach a final decision on these issues, following the provisions of the dietary supplement act.

G. RDI's for Specific Nutrients

17. Several comments stated that the proposed RDI's for particular nutrients were too low. Several of the comments recommended higher levels for these nutrients. Specifically, the comments said that vitamin A should be 1,000 retinol equivalents; calcium, 1,200 mg; iron, 15 mg; vitamin D, 400 IU; vitamin E, 10 alpha-tocopherol equivalents; thiamin, 1.5 mg; riboflavin, 1.7 mg; niacin, 19 niacin equivalents; vitamin B_6, 2 mg; and zinc, 15 mg.

If FDA decided to use the population coverage approach in establishing the RDI for vitamins and minerals, the RDI values for the nutrients listed above would be consistent with the comments. However, based on the provisions of the DS Act, the agency is retaining the label reference values as established in current § 101.9(c)(7)(iv). Therefore, FDA notes that the RDI for vitamin A is 5000 International Units; for calcium, 1.0 g; iron, 18 mg; vitamin E, 30 International Units; and niacin 20 mg. FDA will reach a final decision on these issues, following the provisions of the DS Act.

18. Several comments asserted that there is a need to distinguish between retinol and beta-carotene as a source of vitamin A activity, and one requested that FDA establish a label reference value for beta-carotene. The general rationale provided was that beta-carotene is more strongly associated with reducing the risk of chronic disease than is retinol.

The issue of providing for separate beta-carotene declarations in the nutrition label is discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**. FDA does not agree that it is appropriate to establish a label reference value for beta-carotene separate from the value for overall vitamin A activity. As set forth in the preamble to the proposal for this final rule (55 FR 29476 at 29479), FDA intended to establish label reference values for those nutrients for which quantitative values were provided by the widely recognized and accepted consensus reports, specifically the 10th edition of the NAS RDA publication (Ref. 26), Diet and Health (Ref. 3), and the Surgeon General's Report on Nutrition and Health (Ref. 2). While these reports have discussed evidence to link lower beta-carotene consumption with increased risk for certain cancers, notably lung cancer, the reports noted the evolving nature of the issue and failed to make specific dietary recommendations concerning this food component. The reports, therefore, did not specify quantitative recommendations for intake, and the comments received relative to this proposal have not suggested or justified an appropriate intake level.

Without guidance from established scientific bodies and in the absence of scientific consensus both on the role of beta-carotene in the risk of onset of certain chronic diseases and on the quantitative level that could be appropriate for a population-based recommended intake of beta-carotene, FDA concludes that establishing such a label reference value cannot be supported. However, FDA will continue to monitor scientific advances as well as ongoing recommendations relative to beta-carotene nutriture. The agency will consider modifying or expanding label reference values as evidence warrants.

19. A few comments specifically expressed concern that the RDI for vitamin C was too low for persons in the U.S. population who smoke. This concern stems from evidence that persons who smoke cigarettes may require more vitamin C than persons who do not.

FDA is aware that the 10th edition of the NAS RDA publication includes a statement in the text that recommends that regular cigarette smokers ingest at least 100 mg of vitamin C daily. However, FDA advises that the NAS RDA for vitamin C for the general population is set no higher than 60 mg. FDA has established label reference values that, of necessity, must be targeted to the entire population, rather than special population subgroups. In the absence of information to suggest that the 1989 NAS RDA's are an inappropriate basis for label reference values, FDA does not agree that the RDI for vitamin C should be a value other than the highest value set for persons 4 or more years of age. FDA supports nutrition education efforts that will inform those individuals whose requirements may be altered by lifestyle choices about their special nutrient needs.

20. One comment from a research foundation expressed concern about the high levels of iron available in the diet and thus supported the proposed RDI for iron of 12 mg as compared to the current U.S. RDA of 18 mg. The comment was made within the context of a discussion of hemochromatosis, a genetic disorder resulting in iron overload. A number of comments from consumers also expressed concern about excess levels of iron in the diet and supported lower label reference values for iron.

FDA advises that with the advent of mandatory nutrition labeling, virtually all foods will bear information on iron content. Thus, those persons diagnosed with, or at risk for, hemochromatosis will be able to select or reject a food based on their special dietary needs. Additionally, the agency will continue to make use of the active nutrition monitoring system to evaluate clinical measures and dietary intakes concerning the incidence of hemochromatosis. The agency notes that data from the Third National Health and Nutrition Examination Survey conducted by the National Center for Health Statistics can be used as a basis for reconsidering of the values for iron if concerns regarding hemochromatosis are demonstrated.

21. A number of comments addressed the issue of the RDI for folate. The majority opposed the proposed RDI value of 180 µg, which is lower than the current U.S. RDA of 400 µg. Several of the comments suggested that the 1989 NAS RDA for folate was an

inappropriate basis for establishing a RDI for folate, and a number of comments requested that the agency retain the U.S. RDA level of 400 µg (800 µg for pregnant women). One comment, in referring to the conclusion in the 1989 NAS RDA publication (Ref. 26) that diets containing about half as much folate as the previous NAS RDA maintain adequate folate status, asserts that the folate content of foods in nutrient data bases is recognized as inaccurate and incomplete. According to the comment, basing recommended intakes on intake data derived from these data bases is unsound. Several comments stated that there is evidence that folic acid supplements play a role in reduction in neural tube defects.

To a certain extent, some of these comments would be addressed by use of the population coverage approach to deriving RDI's. As a result of this approach, the RDI for folate would be 200 µg, i.e., based on the highest RDA value for persons 4 or more years of age (excluding pregnant or lactating women). However, FDA is aware of concerns regarding the adequacy of the data base for folate content of foods, which in part served as the basis for establishing the RDA for folate. Recent analytical work (Ref. 37) has shown that folate content of some foods may be underestimated because of methodological problems in current food folate assay procedures. FDA therefore agrees that additional work is needed to evaluate the adequacy of current intakes of folate.

Moreover, several studies have become publicly available since the publication of the 1989 RDA's, and these studies have shown that periconceptional intake of folate may reduce the risk of some neural tube defects. A randomized clinical intervention trial conducted in Great Britain by the Medical Research Council (Ref. 38) showed significant protective effects against recurrence of neural tube defects when women at high risk of recurrence were treated periconceptionally with daily doses of 4,000 µg of folic acid. Additionally, data available from a recently terminated Hungarian trial showed reductions in occurrence of neural tube defects with periconceptional use of a multivitamin/multimineral supplements containing 800 µg/day of folic acid (Ref. 39).

The results of these trials have led to reassessment of several earlier observational studies. Protective effects of the vitamin at levels of 100 to 1,000 µg/day (obtained from foods and supplements) against occurrence of neural tube defects have been found in several but not all such observational studies.

FDA concludes that the available data demonstrate that there is a folate-related subset of neural tube defects in populations with high prevalence rates for these defects, and that folate intakes of about 400 µg/day may reduce the risk of some, but not all, neural tube defects in such populations. Furthermore, the agency notes that the United States Public Health Service (U.S. PHS) recently recommended that women of childbearing age in the United States who are capable of becoming pregnant should consume 400 µg of folate/day for the purpose of reducing their risk of having a pregnancy affected with spina bifida or other neural tube defects (Ref. 40).

FDA has seriously considered these findings relative to the appropriateness of retaining the approach of selecting the highest 1989 NAS RDA value (excluding pregnant or lactating women) when determining the RDI for folate. The agency has weighed the established and well-recognized scientific consensus inherent in the NAS RDA along with newer evidence of a possible at-risk population that constitutes a considerable segment of the U.S. population. Taken together, the agency concludes that these findings—specifically, the evidence of problematic data on folate intakes, the possibility that intakes of 400 µg/day may reduce the risk of some neural tube defects, and the recommendation of the U.S. PHS that women of childbearing age consume 400 µg/day of folate—are sufficiently compelling to justify at this time a RDI value of 400 µg for persons 4 or more years of age and, for consistency, a RDI of 400 µg for lactating women. Given that the current U.S. RDA is 400 µg, and that the DS Act compels retaining the U.S. RDA's at this time, no action is necessary. However, the issue of folate allowances for women is a significant one. Specifically, as discussed in a companion document entitled "Final Rule; Health Claims: Folic Acid and Neural Tube Defects" published elsewhere in this issue of the **Federal Register**, FDA is concerned about the uncertainties regarding the folate requirement of women of childbearing age and is planning to implement a peer review of several scientific issues relating to folate and its benefits for U.S. women. In this review, the agency will include an evaluation of the appropriate intake level for folate for women of childbearing age.

22. Two comments suggested that an intake based on a range of 6 to 10 mg/kilogram (kg) body weight would be appropriate for maintenance of healthy magnesium status. Another comment suggested that the RDI be increased to at least 350 mg as compared to the proposed value of 300 mg.

The 10th edition of the NAS RDA publication (Ref. 26) states that 4.5 mg/kg is the upper range of requirements determined in modern balance studies for adults of both sexes. Therefore, FDA cannot agree that a range of 6 to 10 mg/kg is supported. The level of 4.5 mg/kg provides the basis for the NAS RDA's for magnesium which range from 120 to 400 mg for persons 4 or more years of age. Given that dietary magnesium deficiency has not been reported in people consuming foods commonly available and has been induced experimentally only once (Ref. 26), the agency believes that this level is more than adequate to cover the needs of virtually all population groups.

Moreover, FDA use of the population coverage approach in establishing the RDI for vitamins and minerals, would result in an RDI for magnesium of 400 mg, and thus would respond to concerns that the proposed RDI of 300 mg was too low. However, in accordance with the DS Act, FDA is not acting on this issue at this time.

23. FDA received several comments expressing concern about the generally recognized as safe (GRAS) status of selenium, fluoride, and chromium. These comments centered primarily around issues of their use in supplements.

The use of selenium, fluoride, and chromium compounds in dietary supplements is discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**. In that final rule, the agency states that FDA is deferring resolution of the status of selenium and chromium. However, FDA would like to reiterate (as stated in the July 1990 proposal, 55 FR 29476) that until the GRAS status of sources of these nutrients is resolved, the RDI's for selenium, fluoride, and chromium, if established, would be intended to be used only in conjunction with a declaration of the levels of these nutrients that are naturally present in the food or, in the case of fluoride, that are present as a result of the use of a fluoridated water supply in the processing operation (in accordance with 21 CFR 250.203). Any direct addition of these trace minerals to a food is based solely on the manufacturer's judgment that the nutrient sources are GRAS and is not sanctioned by the agency.

However, because FDA is, for the time being, retaining the label reference values in current § 101.9(c)(7)(iv), there

are no label reference values for selenium, fluoride, or chromium. FDA will reach a final decision on these issues based on the provisions of the DS . ct.

IV. Label Reference Value for Protein

24. Two comments were received concerning the inconsistency between the label reference value for protein (RDI) and the label reference values for fat and carbohydrate (DRV's) in that the total caloric contribution of the three nutrients does not sum to 100 percent. One comment stated that the proposed value of 50 g for protein is too low because, based on a 2,350 calorie diet (i.e., the level proposed to serve as the basis for certain label reference values), the proposed 50-g level of protein would provide only 8.5 percent of the calories in a daily diet. The comment suggested that a level of protein that is consistent with 10 to 11 percent of calories from protein is appropriate, along with levels of 35 percent of calories from fat and 55 percent of calories from carbohydrate. The second comment suggested that FDA should resolve the discrepancy between the proposed protein RDI (50 g) and the value for protein that would be established if the value were based on the percentage of calories derived from protein. The comment stated that 10 percent of calories from protein is appropriate, and that the remaining 5 percent of calories that results after 30 percent of calories is attributed to fat, 10 percent to protein, and 55 percent to carbohydrate should be added to the carbohydrate caloric contribution (specifically, to the contribution from complex carbohydrates).

FDA has not traditionally specified label reference values for calorie-providing nutrients other than protein (i.e., no label reference values existed for fat or carbohydrate). Thus, the agency has not needed to consider issues related to the sum of caloric contributions from protein, carbohydrate, and fat, specifically that these values sum to 100 percent. Furthermore, recognized authorities on protein allowances provide for the allowance based on the amount of protein needed per kg of body weight rather than on the basis of percent of calories (Refs. 2, 3, and 26).

However, the agency agrees that with the advent of label reference values for fat and carbohydrate, it is appropriate to reconsider the approach used to derive the label reference value for protein. In addition to providing for a consistent and interrelated set of label reference values for calorie-providing nutrients, the change in approach will facilitate consumer education efforts.

Furthermore, the decision to use the population coverage approach (i.e., selecting the highest NAS RDA value for persons 4 or more years of age excluding pregnant or lactating females) for establishing label reference values for essential vitamins and minerals (i.e., nutrients with NAS RDA's) must also be evaluated relative to its appropriateness for protein, a nutrient for which an NAS RDA is also established. This is especially important given the caution expressed in Diet and Health (Ref. 3) concerning excessive protein intake, particularly from animal sources.

While FDA received many comments that suggested that FDA return to the approach of selecting the highest NAS RDA value to serve as the label reference value, no specific comments were received suggesting that the proposed label reference value for protein (50 g, based on an adjusted average of the RDA's for protein) was too low because of public health concerns, or that the label reference value placed certain population groups at-risk for low protein intakes. Therefore, the appropriateness of using the population coverage approach for protein was not specifically supported by the comments.

FDA therefore concludes that there is sufficient support to establish a DRV for protein rather than a RDI. This change to a DRV is necessary because the agency is no longer basing the label reference value for protein on the RDA's for protein. RDI's are based on RDA's. Rather, like the label reference values (i.e., DRV's) for fat and carbohydrate, the label reference value for protein is based on percent of calories.

Neither the NAS RDA publication (Ref. 26), the Surgeon General's Report (Ref. 2), nor Diet and Health (Ref. 3) suggests a specific level of total daily calories from protein. However, current intake of total dietary protein among Americans is estimated to be about 11 percent of calories (Ref. 3) and generally exceeds the NAS RDA for all age groups. Furthermore, some international guidelines for nutrient intake recommend that protein constitute 10 to 12 percent of calories (Ref. 3).

Based on the comments that suggested that approximately 10 percent of calories from protein should provide the basis for establishing a label reference value for this nutrient, FDA concludes that basing the DRV for protein on 10 percent of calories is reasonable. The level of 10 percent of calories is consistent with the NAS RDA in that the percent of calories from protein that results when the NAS RDA for each age/sex group is compared with the caloric allowance established for that group ranges from 5 to 11 percent and could be rounded to 10 percent.

Thus, FDA advises that the label reference value for protein for adults and children 4 or more years of age (excluding pregnant or lactating females) will be a DRV rather than a RDI (proposed as § 101.9(c)(12)(i) and redesignated below as § 101.9(c)(9)), and will be the value that constitutes 10 percent of the calorie level to be used as the caloric basis for the DRV's. As discussed below, this calorie level is 2,000 calories. Therefore, the label reference value (DRV) for protein will be 50 g (i.e., 10 percent of 2,000 calories = 200 calories from protein; because 1 g of protein furnishes 4 calories (Ref. 26), the result is 50 g of protein).

FDA did not propose DRV's for infants, children less than 4 years of age, pregnant women, and lactating women. Therefore, for these groups the protein label references remain as RDI's (proposed as § 101.9(c)(11)(iv) and redesignated below as § 101.9(c)(8)(iv)). To be consistent with the population coverage approach, FDA has selected the highest NAS RDA for protein for infants and the highest NAS RDA for protein for lactating females. Only one NAS RDA value is provided for pregnant women and for children less than 4 years of age, thus no selection need be made. However, despite the change in approach, the RDI's for protein are the same as those proposed for these four groups. Therefore, the label reference value for protein will be: (1) A DRV of 50 g for adults and children 4 or more years of age and (2) RDI's of 14 g for infants, 16 g for children less than 4 years of age, 60 g for pregnant women, and 65 g for lactating women.

The decision to establish a DRV for protein based on 10 percent of calorie intake (so that DRV's for calorie-providing nutrients sum to 100 percent of calories) requires an adjustment in the proposed label reference value for total carbohydrate, i.e., 55 percent calories from carbohydrate. The necessary adjustment is discussed below.

Also, consistent with these changes, additional changes are necessary in proposed conforming amendments. FDA is amending § 101.3(e)(4)(ii) (21 CFR 101.3(e)(4)(ii)) by not only removing the term "U.S. RDA" and adding in its place the term "RDI," but also by adding the term "DRV of protein." FDA is also amending § 104.20(c)(1) and (d)(3) to list the DRV for protein.

V. DRV'S: Label Reference Values for Eight Nutrients without NAS RDA'S

A. Terminology

25. Two comments were received that expressed concern about the use of the word "value" in the term DRV. These comments stated that the word "value" may imply a goal rather than a reference level, and that the word generally connotes desirability.

No data were submitted to support the suggestion that word "value" may mislead consumers. Furthermore, FDA research has indicated that the term is generally understood by consumers as a point of reference. No other comments objected to the term on these grounds. FDA finds there is no compelling reason to abandon the proposed DRV terminology.

B. Scientific Basis for DRV's

26. Several comments expressed concern that the DRV's were based on insufficient or conflicting data, or that they lack sufficient scientific justification.

FDA acknowledges that the role of nutrients and food components in reducing the risk of disease is in an evolving state. However, numerous dietary reports and reviews relating to diet and health—particularly on the effect of diet on the risk of developing certain chronic diseases—have been published within the last decade. These reports, including Diet and Health (Ref. 3), the Surgeon General's Report on Nutrition and Health (Ref. 2), and Dietary Guidelines for Americans (Ref. 5), represent a sufficient scientific consensus that justifies the agency's proceeding with the establishment of DRV's. This conclusion is supported by the Institute of Medicine report entitled "Nutrition Labeling: Issues and Directions for the 1990s" (Ref. 1), which states that health professionals have achieved a consensus on the characteristics of foods Americans should choose to have both a healthier diet and to reduce the risk factors for chronic diseases and conditions.

Concerns pertaining to the possibility that scientific consensus may change are not unique to the DRV's. The NAS RDA's, and thus the RDI's, are also subject to change and can be affected by shifts in scientific consensus. While it can be argued that the NAS RDA's are less likely to change because they have evolved over a longer period of time than the DRV's, any force from this argument is not sufficient to preclude using widely recognized and accepted recommendations to establish DRV's. This action is important given current public health goals and the clear role that the food label can play in achieving these goals. FDA acknowledges that the scientific knowledge that underlies the DRV's may change over time, and so the agency intends to monitor and evaluate scientific consensus relative to existing DRV's as well as other nutrients known to bear on to the diet/health relationship. Furthermore, the petition process provided by agency regulations enhances and encourages this review. Accordingly, FDA is adopting the DRV's as proposed, with some modifications.

C. Caloric Basis for DRV's

27. While several comments supported FDA's proposal to use 2,350 calories as the basis for establishing certain DRV's that are based on daily caloric intake, most comments were opposed to the proposed value because they believed that it is too high. Many expressed concern that the resulting DRV's for total fat and saturated fat would overstate acceptable intakes for population groups that habitually consume less than 2,350 calories. Others were concerned that the calorie level would appear too high and, thus, would be irrelevant to many consumers. A few comments suggested that the level of 2,350 may encourage overconsumption of calories, especially among women.

Many comments suggested that FDA use 2,000 calories as the basis for the DRV's. The rationale for selecting 2,000 calories as opposed to other lower values varied, but reasons given included the fact that it is consistent with widely used food plans, it approximates the caloric requirements for postmenopausal women who are at-risk for excessive intake of calories and fat, and it is a "rounded down" value for 2,350 calories. These comments also pointed out that 2,000 calories is easier to use in quick, mental calculations compared to other calorie levels such as 1,900 or 2,350. Therefore, it is an easier tool for education purposes and is "consumer friendly." A few comments suggested 1,900 calories be used as the basis because it reflects the caloric allowance set by the NAS for women 51 or more years of age, a group believed to be at-risk for excessive calorie and fat intake.

FDA agrees with the comments that there is a need to select a lower calorie level for the DRV's. First, FDA agrees that a rounded value will be easier for consumers to use and is less likely to suggest such a level of precision that consumers lose sight of the concept of tailoring recommendations and reference values to their own diets. Secondly, the use of a lower caloric value is consistent with the population coverage approach to be used for vitamins and minerals. The group "at risk," in this case the group most often targeted for weight control (i.e., older women), is covered by selecting a lower caloric basis for the DRV's, one that approximates the caloric requirements of such women. Given the support expressed for the 2,000 calorie level and how well it fits the reasons that support making this change, FDA will use 2,000 calories as the basis for DRV's (proposed as § 101.9(c)(12)(i), redesignated below as § 101.9(c)(9)).

Based on a 2,000 calorie level, the resulting DRV's being incorporated into § 101.9(c)(9) are listed in the following table:

Food component	Unit of measurement	DRV
Total fat	g	65
Saturated fat	do	20
Cholesterol	mg	300
Total carbohydrate.	g	300
Dietary fiber	do	25
Sodium	mg	2,400
Potassium	do	3,500
Protein	g	50

As stated in the July 1990 proposal (55 FR 29476 at 29484), revisions of the nutrition labeling regulations in § 101.9 to update the U.S. RDA values necessitate that, for consistency, FDA revise several other regulations. FDA proposed to revise § 104.20(d)(3) to include the statement "The food contains all of the following nutrients per 100 calories based on 2,350-calorie total intake as a daily standard" and by providing a proposed table that listed the amounts of nutrients (per 100 calories) based on a 2,350 calorie diet and based on the proposed RDI levels. FDA has recalculated the nutrient levels in § 104.20(d)(3) to reflect the RDI values presented in this final rule based on a 2,000 calorie diet and included a statement indicating that the amounts of nutrients per 100 calories are based on a 2,000 calorie total intake.

28. Several comments stated that DRV's should be established in a fashion that provides for a different set of DRV's for different caloric intakes or, alternatively, that provides for a range of values such as a minimum/maximum range. These comments argued that the proposed DRV's are too simplistic and would encourage overconsumption of calories and fat, especially among women. One of these comments provided an extensive rationale for developing three sets of DRV's based on three levels ("benchmarks") of calorie intake.

FDA is aware of the problems associated with providing a single label reference value when in fact

recommended intakes or nutrient allowances for individuals vary considerably. The concern expressed is somewhat analogous to the difficulties in deriving a single set of RDI's based on the NAS RDA's, which are established for different sex/age groups.

In the case of DRV's, FDA believes that the purposes of nutrition labeling are better served by implementing a single value to serve as the DRV for each nutrient because the percent DRV (expressed as Daily Value) will be a component of mandatory nutrition labeling. This labeling will be required on virtually all foods and, therefore, space considerations are significant. At the same time, if consumers are to use the important and necessary information provided by DRV's (expressed as Daily Value), the information must be presented in a readable format and in a manner that does not overburden or overwhelm consumers. The agency finds that a single value DRV will best accommodate these considerations of space and readability. In the companion document that specifies the final rule for Mandatory Nutrition Labeling, FDA is providing for a statement that is to be added to the label advising that the particular amount of certain nutrients a person may consume will vary depending upon calorie requirements. This information, coupled with education, should adequately address the concerns raised by the comments by ensuring that consumers will understand that diets of individuals will not necessarily match label reference values.

The concerns that the proposed DRV's will encourage overconsumption among women is addressed by FDA's decision to base the DRV's on a caloric consumption of 2,000 calories rather than 2,350 calories. The 2,000 calorie level is very close to the 1,900 calories recommended for women 51 or more years of age.

However, the requirement that a single DRV be used in the nutrition label does not preclude the option of manufacturers voluntarily adding a listing of DRV's for other calorie intakes if label space allows. The comments have persuaded FDA that this voluntary declaration could be useful to consumers. Therefore, while the DRV's based on a 2,000 calorie diet constitute the mandatory component of the listing (space permitting), producers and retailers may voluntarily add a listing of DRV's for a different specified calorie level or levels than those provided by § 101.9(c)(9). Manufacturers who wish to take advantage of this option should calculate, with appropriate rounding, (1) fat based on 30 percent of calories, (2) saturated fat based on 10 percent of calories, (3) carbohydrate based on 60 percent of calories, (4) protein based on 10 percent of calories, and (5) fiber based on 11.5 g of fiber per 1,000 calories. These calculations reflect those used to derive the DRV's based on a 2,000 calorie diet. As an example, a manufacturer could voluntarily list DRV's for a 1,500 calorie diet as follows: 50 g fat, 15 g saturated fat, 225 g carbohydrate, 40 g protein and 20 g fiber; or for a 2,500 calorie diet: 80 g fat, 25 g saturated fat, 375 g carbohydrate, 60 g protein, and 30 g fiber.

D. Units of Measurement and Rounding Procedures for DRV's

29. One comment disagreed with FDA's rounding procedure for the DRV's for fat, unsaturated fat, polyunsaturated fat, and carbohydrate. The comment suggested that the whole numbers derived before rounding should be used as the DRV. For instance, 30 percent of calories from fat (based on a 2,350 calorie diet) results in 78.3 g of fat. The comment argued that the DRV should be a value rounded to 78 g instead of the proposed 75 g.

FDA's rounding procedures for DRV's were intended to provide values that are "consumer friendly" numbers easily incorporated into educational programs as well as values that are generally consistent with the dietary recommendations. The possibility that DRV's could be listed on food labels as quantitative amounts instead of as percentage values led the agency to conclude that rounding to numbers such as 25 or 325 facilitated consumer education and did not imply more scientific precision than is justified given the evolving state of dietary recommendations. Furthermore, several comments urged FDA to select values that are easy for consumers to use and that do not suggest precision in determining the values. Therefore, the agency believes that there is support for the rounding approach that it used and agrees that consumers will find numbers such as 75 and 25 as more "friendly" and easily remembered than numbers such as 78 and 26. No other comments were received concerning this issue, and therefore FDA finds no compelling reason to provide alternative rounding procedures.

E. DRV for Total Fat

30. Several comments suggested that the use of 30 percent of calories from fat is inappropriate as the basis for developing a DRV for total fat. Some comments suggested that the level used should be 25 percent of calories from fat; one stated that 20 percent of calories from fat should be used. These comments argued that the established recommendation is a maximum level because it is stated as 30 percent or less of calories from fat. Therefore, some level below this maximum should be used. On the other hand, one comment recommended that FDA use 35 percent of calories from fat. The concern expressed in this comment was that levels below 35 percent of calories from fat will bias diets toward vegetarianism.

FDA rejects the arguments that the DRV should be based on a criterion other than 30 percent of calories from fat. As described in the preamble to the proposal, the major available consensus documents, which were used by FDA in developing the DRV, consistently recommend 30 percent of calories or less from fat as an appropriate intake, given that current intake approaches 40 percent of calories from fat. Thus, a level higher than 30 percent of calories cannot be supported because the widely supported recommended intake is no more than 30 percent of calories from fat. The comment stating that intake levels below 35 percent of calories from fat will bias diets toward vegetarianism did not provide evidence to support this statement. FDA is not aware of any data that suggests that diets at or below 30 percent of calories from fat preclude the inclusion of animal products.

On the other hand, while current consensus reports suggest that less than 30 percent of calories from fat is achievable and may be desirable, they fail to provide specific quantitative recommendations as to how far below 30 percent is advisable. In fact, no consensus exists on the appropriateness of specific intakes of less than 30 percent of calories from fat.

However, the agency is aware of the desirability of alerting consumers to the direction of the DRV for total fat in that it is helpful for consumers to know that intakes of 30 percent of calories or less is the goal. Thus, FDA is providing that the listing of the DRV for total fat on the nutrition label include the words "less than," as described in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the Federal Register.

31. Many comments suggested that the DRV for total fat should be lower than the proposed value of 75 g.

FDA agrees with these comments. With the change to a 2,000 calorie basis for DRV's, the DRV for total fat will be 65 g. The level was derived by calculating 30 percent of 2,000 calories and dividing by 9 which is the number of calories per g of fat. The calculated value is 66.7 g of fat. FDA rounded this

amount down to 65 g because, given that the current recommendation for total fat intake is 30 percent of calories or less, it is more appropriate to round down than to round up. Furthermore, as explained above, many comments have encouraged the agency to select label reference values that are easier for consumers to work with and recall, for instance 65 g of fat rather than 66 g.

F. DRV for Saturated Fat

32. Several comments suggested that because the proposed calorie basis (2,350 calories) is greater than the allowance for many persons, the proposed DRV for saturated fat (25 g) is too high.

FDA agrees with these comments. With the change in the basis for DRV's to 2,000 calories, and using the recommended intake of less than 10 percent of calories from saturated fat, the DRV for saturated fat is 20 g. The actual amount calculated using 10 percent of 2,000 calories is 22.2 g. However, because the current dietary recommendation specifies less than 10 percent of calories from saturated fat and for other reasons discussed above, FDA rounded this value down to 20 g.

33. One comment referenced Diet and Health (Ref. 3) which states that a saturated fat intake that is 7 to 8 percent of calories or lower would confer greater health benefits than the recommendation for less than 10 percent of calories. The comment suggested that FDA use 7 percent of calories from saturated fat as the basis for the DRV.

While the report cited does include an advisory statement as to the possibility of increased benefits with lower intakes, the committee responsible for Diet and Health specifically recommended less than 10 percent of calories from saturated fat. This recommendation was based not only on issues of health benefits but also on considerations of realistic diet modifications among American consumers. FDA believes that this approach is both prudent and practical. No other comment suggested the level of 7 percent of calories from saturated fat as the basis for the DRV. The agency, therefore, used 10 percent of calories from saturated fat with a rounding down procedure as described above in deriving the DRV for saturated fat.

G. DRV for Unsaturated Fat

FDA's intent in developing a DRV for unsaturated fat was to complete the set of label reference values for fat. The DRV's for fat and saturated fat reflect current recommendations to limit total fat intake to 30 percent of calories and saturated fat intake to less than 10 percent of calories. To account for the component of total fat that remains, FDA derived the DRV for unsaturated fat by calculating 20 percent of calories and dividing by 9. The agency arrived at the factor of 20 percent by subtracting the 10 percent of calories from saturated fats from the 30 percent of calories for total fat.

However, as discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**, comments have convinced the agency that the listing of unsaturated fat on the food label is potentially confusing to consumers and could result in consumer deception. As discussed in that companion document, comments stated that the listing was not useful, that it offered no additional information that could not be obtained by subtracting the saturated fat content from total fat, and that it obscures the presence of essential fatty acids.

Moreover, other comments persuasively argued that the term "unsaturated fat" is misleading because it suggests that all unsaturated fats are synonymous by including both cis and trans isomers and poly- and monounsaturated fats together. Based on these comments, FDA decided not to include a listing of unsaturated fat in nutrition labeling. Therefore, FDA finds that there is no need for a label reference value for unsaturated fat and, accordingly, has deleted the proposed DRV for it in this final rule.

34. One comment requested that FDA eliminate the proposed DRV for unsaturated fat and replace it with a DRV for polyunsaturated fat with a value of 25 g. The comment argued that this approach was supported by evidence that: (1) Polyunsaturated fats lower serum cholesterol, (2) current dietary recommendations are to maintain or modestly increase polyunsaturated fat intake, (3) low polyunsaturated fat intake is linked to increased risk of coronary heart disease, (4) consumers are familiar with polyunsaturated fat declarations on labels, and (5) declarations of unsaturated fat will clutter a nutrition label and do not provide useful information.

While FDA has been persuaded to eliminate the DRV for unsaturated fat, FDA does not agree that the establishment of a DRV for polyunsaturated fat of 25 g is appropriate. As stated in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**, FDA is not persuaded that there is a need to require the inclusion of polyunsaturated fats on the nutrition label. As discussed, these fatty acids do not meet the agency's criteria set forth in the proposal to the final rule (55 FR 29487 at 29493) that the nutrient be of particular public health significance and that quantitative intake recommendations be given in major scientific consensus reports.

Nonetheless, given consumer interest in polyunsaturated fats, FDA is allowing manufacturers to voluntarily list the amounts of polyunsaturated fats on the nutrition label. This provision is discussed in detail in the Mandatory Nutrition Labeling final rule, published elsewhere in this issue of the **Federal Register**. Also, the agency acknowledges that Diet and Health (Ref. 3) has recommended that total polyunsaturated fat intake be maintained at 7 percent of calories and not exceed 10 percent of calories. This guideline translates into a recommended level of intake of approximately 16 g of total polyunsaturated fat, which should not exceed 22 g, based on the criterion of a 2,000 calorie diet.

However, FDA's definition for polyunsaturated fat includes only the cis isomers of the polyunsaturated fatty acids, as described in the Mandatory Nutrition Labeling final rule. Thus, voluntary label declarations for polyunsaturated fat exclude trans isomers. As discussed in the Mandatory Nutrition Labeling proposed rule (55 FR 29487 at 29496), FDA believes that the limited definition is appropriate because declarations concerning polyunsaturated fats are at a level of specificity associated with targeted diet and health relationships.

Therefore, while label declarations include only the cis isomers, the available recommendation for polyunsaturated fat intake is based on total polyunsaturated fat intake. There are no quantitative recommendations for polyunsaturated fat intake that distinguish between the recommended intake of cis isomers and trans isomers of polyunsaturated fat. FDA concludes that a DRV based on recommendations pertaining to total polyunsaturated fat would be inappropriate when label declarations are to be based on only a component of the total polyunsaturated fat. Declarations when compared to the DRV would be misleading. Thus, the agency has not established a DRV for polyunsaturated fat.

35. One comment stated that the proposed DRV for unsaturated fat (50 g) was too high because current guidelines suggest that saturated and polyunsaturated fat should be up to 10 percent of calories, and that the rest of

the caloric contribution should come from monounsaturated fats.

The comment does not reference the source for the guideline that it discusses, and FDA is unaware of such a guideline. FDA does not agree that the current consensus reports suggest that 20 percent of calories should come from monounsaturated fats, and that the remaining caloric contribution of 10 percent of calories should be attributed to all other fats. Rather, as discussed in Diet and Health (Ref. 3), the current general recommendations are that polyunsaturated fat not exceed 10 percent of total calories, and that saturated fat be less than 10 percent of total calories. No specific recommendations for monounsaturated fat are provided in the major consensus reports currently available to the agency.

36. One comment stated that it is not appropriate to recommend 20 percent of calories from unsaturated fat without also stating that linoleate is an essential fatty acid and as such should comprise at least 3 percent, and perhaps as much as 7 percent, of calories in line with the current average intake in the United States.

The agency's decision to eliminate the DRV for unsaturated fat responds to the essential concern of this comment, that declarations concerning levels of unsaturated fat could be misleading without further information. As stated earlier, no DRV for unsaturated fat will be established, and thus the issue concerning the linoleate component of the DRV need not be addressed.

H. DRV for Cholesterol

37. One comment suggested that many experts agree that a single number for recommended cholesterol intake cannot be supported and requested that FDA eliminate this DRV. The comment also suggested that if the DRV is to be retained, the DRV for cholesterol should be expressed as a range. However, the comment did not specify an appropriate range. One comment stated that the DRV for cholesterol was inappropriate because Canadian nutrition recommendations do not provide quantitative advice on cholesterol intake.

FDA cannot agree that a DRV for cholesterol is unnecessary, or that many experts do not support a single overall recommended intake for cholesterol. Major public health initiatives in the United States have cited the need to limit cholesterol intake, and quantitative recommendations for cholesterol intake have evolved over a long period of time. Recently, the report of the Expert Panel on Population Strategies for Blood Cholesterol Reduction, National Cholesterol Education Program (Ref. 41) stated that it is important for Americans to change their eating patterns to reduce the average intakes of dietary cholesterol.

As documented in Diet and Health (Ref. 3), there are a number of sources of recommendations concerning cholesterol intake, and the most widely used recommendation is to limit intake to 300 mg or less/day. The American Heart Association has recently re-reviewed this issue and recommended that cholesterol intake should be less than 300 mg/day (Ref. 42). Furthermore, a review of a summary table in Diet and Health (Ref. 3) reveals only one U.S. recommendation that provides a range for cholesterol. The range is 250 to 300 mg/day prescribed for a high-risk population rather than for the general public. Therefore, FDA does not agree that the DRV for cholesterol is unnecessary or inappropriate, nor that it should be expressed as a range. The agency is retaining the DRV for cholesterol at 300 mg (proposed as § 101.9(c)(12)(i) and redesignated below as § 101.9(c)(9)).

38. One comment recommended that the DRV for cholesterol be eliminated because the 300 mg level may encourage women and children, whose mean intakes as indicated by national surveys are below 300 mg, to increase their intakes.

FDA cannot agree that the DRV of 300 mg for cholesterol will encourage women and children to increase consumption of cholesterol. The major consensus reports, upon which the DRV is based, have considered the intake of cholesterol relative to women and children and have found no evidence that establishing a recommendation at approximately 300 mg/day will cause risk for these groups, which constitute a large percentage of the target population (Refs. 2 and 3).

More importantly, the lower calorie intakes among these population groups will likely result in lower intakes of cholesterol by these persons. Given current widespread and highly visible education programs, it is very unlikely that individuals will attempt to increase cholesterol intake to match a label reference value for a nutrient that is so generally known as one to be limited in the diet. Furthermore, as discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**, the DRV for cholesterol will be stated as less than 300 mg, thus providing nutrition information in a way that will further discourage any increase intake.

39. One comment referenced a statement in Diet and Health (Ref. 3) that reductions beyond 300 mg/day of cholesterol intake, for example to levels of 250 or 200 mg/day, may also confer health benefits. The comment suggested that the 300 mg level was based not only on issues of public health but on the feasibility of achieving lower intakes given current consumption patterns, which, in turn, was based largely on anecdotal evidence and personal opinion.

While the report cited does include a statement as to the possibility of increased benefits with lower intakes of cholesterol, the committee responsible for the report specifically recommended a level of 300 mg/day. This recommendation was based not only on issues of health benefits but also on considerations of realistic diet modifications among American consumers. The comment does not cite specifically in what way this recommendation is based on anecdotal evidence or personal opinion, and the agency is unaware of any evidence to support this claim. FDA believes that the DRV of 300 mg for cholesterol is both prudent and practical, and is consistent with current dietary recommendations. No other comment suggested a lower level of cholesterol for the DRV. The agency will therefore retain the DRV of 300 mg. However, as with other nutrients, FDA will continue to monitor consensus reports and scientific evidence concerning the appropriateness of this DRV.

I. DRV's for Total Carbohydrate, Complex Carbohydrates, and Sugars

In the July 1990 proposal (55 FR 29476) and again in the supplementary proposal (56 FR 60366), FDA proposed a level of 325 g to serve as the DRV for total carbohydrate. This quantity was based on recommendations provided by major consensus reports, and specifically on the quantitative recommendation from Diet and Health (Ref. 3) that carbohydrate intake be 55 percent or more of calories. The amount, 325 g, reflects 55 percent of 2,350 calories, the caloric level proposed to serve as the basis for the DRV's.

40. One comment expressed concern that the proposed DRV for carbohydrate exceeds levels that should be consumed by many in the population and is not based on a scientific consensus. The comment suggested that the DRV for carbohydrate be eliminated.

FDA disagrees with this comment. The vast majority of comments that FDA received support the appropriateness of establishing DRV's as well as the validity of the scientific documents

upon which they (including the DRV for carbohydrate) are based. A DRV for total carbohydrate is necessary to assist consumers in understanding the significance of the level of that nutrient in a food within the context of an overall total daily diet. Thus, establishing a DRV for total carbohydrate is consistent with section 2(b)(1)(A) of the 1990 amendments. Additionally, several comments stated that it would be desirable to account for 100 percent of caloric intake in the DRV's for fat, protein, and carbohydrate (i.e., the energy-providing nutrients). Therefore, FDA concludes that a DRV for carbohydrate is appropriate.

41. A few comments requested that FDA establish a DRV for complex carbohydrate. One comment suggested that FDA establish such a DRV because it could be used in nutrition education efforts to help consumers put the dietary recommendations regarding increased carbohydrate intake into perspective. This comment provided a rationale based on the assumption that the current dietary recommendation to increase consumption of complex carbohydrates is meant to provide a caloric source to replace the decrease in caloric intake that will result from following the recommendation to decrease fat in the diet. On this basis, a DRV for complex carbohydrate derived from 35 percent of calories was suggested. Another comment suggested that a DRV based on 40 percent of calories is appropriate (assuming that 10 percent of calories is attributed to naturally-occurring sugars and 10 percent to added sugars, for a total carbohydrate DRV of 60 percent of calories). The third comment suggested that a DRV for total carbohydrate in the absence of DRV's for complex carbohydrates and simple sugars is inappropriate. One comment suggested eliminating the DRV for total carbohydrate and replacing it with a DRV for complex carbohydrate.

FDA agrees that recent dietary recommendations have included suggestions that persons increase their intake of complex carbohydrates. However, FDA does not agree that there is scientific agreement on a specific recommended intake of complex carbohydrates, particularly a level of agreement that will support establishing a DRV. To date, major consensus reports and dietary recommendations have provided only qualitative recommendations for intake of complex carbohydrates. No quantitative recommendations exist. While the calculations that accompany the suggestion of 35 percent of calories from complex carbohydrate are well thought out, they are not at this time supported by other sources. The alternative suggestion of 40 percent of calories from complex carbohydrate is based on a calculation by difference that assumes that 20 percent of calories from naturally occurring and added sugars is justified. Again, FDA finds no basis in the consensus reports upon which to agree.

Moreover, as discussed in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**, the chemical definition for complex carbohydrate remains problematic. A DRV for complex carbohydrate would be inappropriate in the absence of an acceptable chemical definition for complex carbohydrate because the agency does know which chemical entities should be reflected in the complex carbohydrate DRV, and because the agency would be unable to measure complex carbohydrate to determine whether a level listed as present in a food is correct. FDA acknowledges that recommendations concerning complex carbohydrate intake as well as the analytical methodologies for this food component are in an evolving state. Therefore, the agency will continue to monitor scientific evidence relative to the appropriateness of establishing a DRV for this food component.

42. One comment from a consumer advocacy group suggested that a DRV for added sugars and a DRV for naturally-occurring sugars be developed. The comment stated that DRV's in general do not describe ideal diets and do not reflect absolute scientific knowledge but are instead estimates based on the best knowledge available. The comment suggested that because sugars intake is a major public health concern, it is appropriate for FDA to establish a DRV for sugars despite the fact that neither the Surgeon General's Report (Ref. 2) nor Diet and Health (Ref. 3) present quantitative recommendations on sugars intake. The comment suggested that a DRV of approximately 50 g be established for added sugars. The comment said that this level was derived from a FDA report (Ref. 43) that estimated that, on average, 53 g of added sugars are consumed per person per day. The comment asserted that FDA underestimated added sugars intake by one half (although it did not provide evidence to support this claim) and thus said that 50 g would be an appropriate level. The comment also suggested that the DRV for naturally-occurring sugars should be 50 g, also based on the FDA report concerning average consumption/day. The comment again suggested that this estimate is too low by half.

Another comment concerning complex carbohydrates stated that a DRV for complex carbohydrate should be based on 35 percent of calories from carbohydrate, and implied that 20 percent of calories should be attributed to sugars.

In reviewing these comments, FDA considered the report from the World Health Organization (WHO) entitled "Diet, Nutrition and the Prevention of Chronic Diseases" (Ref. 44). The agency recognizes that the recommendation in the WHO report that consumption of refined sugars be limited to 10 percent of calories is not inconsistent with the comment that recommended that a DRV for added sugars be established at 50 g, because, with the agency's use of 2,000 calories as the basis for the DRV's, 50 g of sugars would constitute 10 percent of calories. Furthermore, the agency stated in its proposals (47 FR 53917, November 30, 1982 and 47 FR 53923, November 30, 1982) to affirm that sucrose, corn sugar, corn syrup, and invert sugar are GRAS, that it would monitor average dietary consumption of these ingredients and would reevaluate the safety of their use if total dietary consumption were to increase significantly. The agency concluded in those documents that there could be safety concerns if intake of these ingredients increased significantly over the current levels (approximately 50 g).

FDA acknowledges that there is some support for limiting the intake of added sugars to current intakes of about 50 g or 10 percent of calories. However, the agency has concluded that this support does not furnish a sufficient basis for establishing a DRV for added sugars. First, DRV's are established for nutrients of public health concern. As such, a rational basis for a DRV must in some way link particular, if not specific, levels of intake with adverse or positive health outcomes. Other than dental caries—the incidence of which has been declining considerably among the American population (Ref. 43)—no public health concerns are articulated by the comment or in the relevant reports. Further, in a special review conducted by the agency in the mid-1980's, FDA concluded that other than the contribution to dental caries, there is no conclusive evidence that demonstrates that sugars intake from any source is associated with chronic disease conditions (Ref. 43). The report also states that the development of dental caries occurs whether a sugar is added or naturally occurring, and that caries development is associated with the nature and texture of the food

consumed, not just the total amount of sugars present in the food. Therefore, a specific level of intake that causes risk cannot be identified.

Secondly, as discussed in more detail in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**, there is currently no analytical methodology that would allow the agency to distinguish between sugars that are added to a food and those that are naturally occurring. Therefore, FDA would be unable to evaluate the accuracy of claims about the levels of added sugars in foods. FDA discussed this consideration earlier in its final rule on the GRAS status of certain sugars (53 FR 44863, November 7, 1988). The agency concluded that it would be impractical to enforce limitations on the use of these ingredients in foods.

Moreover, in the absence of analytical capabilities to distinguish between added sugars and naturally-occurring sugars, FDA does not believe that it would be appropriate to establish a DRV for total sugars. There is no consensus concerning the specific proportions of total carbohydrate that should be attributed to total sugars and to complex carbohydrate. Moreover, a DRV for total sugars could be inconsistent with dietary guidelines that encourage the consumption of certain foods, such as fruits and dairy products, that contain naturally-occurring sugars, sometimes at high levels. FDA, therefore, concludes that DRV's for added sugars, naturally-occurring sugars, and total sugars cannot be supported.

This conclusion, however, does not mean that FDA supports unlimited intake of sugars or sugar-rich foods that contain few nutrients except calories. Rather, FDA analyses of food consumption data (Ref. 45) suggest that certain groups in the population would benefit from educational efforts to help them assess the amount of sugars present in foods in relation to the amounts of other nutrients contained in the food. Given this need, as well as consumer interest in levels of sugars in food, FDA has made provision in the Mandatory Nutrition Labeling final rule, published elsewhere in this issue of the **Federal Register**, for declarations in the nutrition label concerning the amount of total sugars present in the food. With educational efforts, consumers will be able to use the nutrition label to differentiate between sugars-containing foods with high versus low nutrient values.

J. Adjustment in DRV for Carbohydrate Resulting from Change in Label Reference Value for Protein

As discussed earlier, the agency has decided to use a caloric basis for the DRV's of 2,000 calories instead of 2,350 calories and to establish a DRV for protein based on 10 percent of calories. These changes from the proposed approach have necessitated an adjustment in the DRV for total carbohydrate.

Based on comments, particularly as discussed above in comment 24, FDA is establishing a DRV for protein rather than an RDI. The DRV value reflects 10 percent of calories from protein, based on a 2,000 calorie diet. FDA proposed to base the DRV's for fat and carbohydrate on their percent contribution to total calories, 30 percent and 55 percent, respectively. If protein is to contribute 10 percent of calories, then it is necessary to account for the remaining 5 percent of calories using the contribution from fat or from carbohydrate. Given the current established recommendation that persons consume 30 percent or less of calories from fat (Refs. 2 and 3), FDA does not believe it would be appropriate to add the remaining 5 percent of calories to the contribution from fat.

Guided by a comment submitted to this docket, discussed above in comment 41, as well as by the fact that Diet and Health recommends that 55 percent or more of calories be derived from carbohydrate (Ref. 3), FDA believes that it is appropriate to increase the DRV for carbohydrate. While the comment suggested the change from 55 to 60 percent of calories from total carbohydrate within the context of providing a DRV for complex carbohydrates (which was not proposed by the agency), the approach can still be applied to total carbohydrate in the absence of a DRV for complex carbohydrate.

This change from 55 percent to 60 percent of calories from carbohydrate is consistent with the recommendation that persons consume 55 percent or more of their calories from carbohydrate, and it allows the energy-yielding nutrients to sum to 100 percent of calories as suggested by the comments to this docket. Therefore, FDA is adopting a DRV for carbohydrate of 300 g, which is 60 percent of 2,000 calories (i.e., 60 percent of 2,000 calories = 1,200 calories; carbohydrate provides 4 calories per g (Ref. 26), thus 1,200 calories divided by 4 calories per g results in 300 g). This change is incorporated into § 101.9(c)(9)).

K. DRV for Dietary Fiber

43. Two comments suggested that the DRV for dietary fiber should not be associated with a specific caloric intake, and that, as in the case of cholesterol, this DRV should be independent of the number of calories consumed. One comment stated that nutritionists recommend similar levels of fiber intake at different levels of caloric intake. However, the comment did not specify a level that would be appropriate for all persons.

As acknowledged in the proposal for this regulation, there is a relative lack of consensus concerning recommended quantitative values for fiber intake. However, several scientific bodies have recommended increased intake of fiber, and comments from consumers and health professionals have strongly suggested the desirability of providing quantitative fiber content labeling on foods. Available recommendations tend to be expressed as a range or as a level that should not be exceeded, rather than as a single number applicable to all persons.

FDA considers the current most authoritative source on recommended fiber intake to be the report issued by the Life Sciences Research Organization (LSRO) of the Federation of American Societies for Experimental Biology (Ref. 46). This report based recommended fiber intakes on an amount (10 to 13 g) per 1,000 calories which, when based on the 2,000 calorie level used for the DRV's, results in a level of intake (20 to 26 g) that is in general agreement with the recommendation of the National Cancer Institute, i.e., 20 to 30 g per day (Ref. 47).

FDA finds no reason to change the basis for deriving the DRV for dietary fiber that it used in the proposal which involved calculating 11.5 g, the midpoint of the 10 to 13 g range, of fiber per 1,000 calories. The change to a 2,000 calorie basis from a 2,350 calorie basis will not change the DRV for fiber (proposed as § 101.9(c)(12)(i) and redesignated below as 101.9(c)(9)), which FDA proposed as 25 g based on a 2,350 caloric intake. The 2,000 calorie calculation (i.e., 11.5 g times 2) results in a value of 23 g, which rounds up to 25 g to provide a number that is easily incorporated into educational programs and is generally consistent with the dietary recommendations.

44. One comment recommended that the DRV for fiber be established as 20 g rather than 25 g. The comment noted that the National Cancer Institute (Ref. 47) and the report from LSRO (Ref. 46) both specify a range of about 20 to 35 g per day. The comment suggested that

the low end of the range is a more realistic goal for the U.S. population considering that current intakes are half of that amount.

FDA does not find the argument for dietary feasibility sufficiently compelling to abandon a level that is clearly within the range recommended by major scientific bodies. FDA is unaware of any evidence to suggest that 25 g per day cannot be met by consumers who select foods from the available food supply, or that it is not achievable through realistic diet modifications. FDA believes that the recommended intake is readily achievable with enhanced educational efforts. FDA is planning for and supporting such efforts.

45. One comment expressed concern that the proposed DRV for fiber exceeds levels consumed by many in the population and is not based on sufficient scientific data. The comment did not further specify the nature of the insufficient data.

As stated in the proposal to this document (55 FR 29476 at 29483), comments received by FDA show that many consumers and health professionals desire quantitative fiber content labeling. Yet, as the agency acknowledged, there is a lack of consensus concerning quantitative values for recommended fiber intake. However, several scientific bodies (Refs. 2, 3, 47, and 48) have recommended increased intake levels for fiber on the basis that fiber may have important health benefits, particularly relative to intestinal function. Furthermore, LSRO has issued a report that provides a quantitative recommended intake for dietary fiber (Ref. 46). Its recommendation of 10 to 13 g fiber per 1,000 calories in the diet is consistent with that of the National Cancer Institute (Ref. 47). The report developed for LSRO by a panel of qualified scientists contains numerous references to scientific research articles and reports in professional journals and publications. FDA is not aware of any concerns about the soundness of the LSRO review. Therefore, FDA is not persuaded that the scientific rationale for the fiber DRV is based on insufficient data.

Secondly, the fact that the DRV exceeds levels currently consumed by many in population is not significant in setting this DRV. As discussed in the preceding comment, FDA is unaware of any evidence to suggest that 25 g per day cannot be met by consumers who select foods from the available food supply. Therefore, FDA concludes that the 25 g level for the DRV for fiber is appropriate.

L. DRV for Sodium

46. A few comments specifically supported creating a DRV for sodium by pointing out that the scientific evidence demonstrates that sodium reduction is beneficial for hypertensive and normotensives alike, and that high salt intake coupled with low potassium and calcium intake is a major cause of high blood pressure and risk of stroke. A few were opposed and argued that the data are scientifically insufficient or questionable.

FDA disagrees that the data are insufficient or questionable. The basis for the agency's position is discussed in detail in the proposal pertaining to a sodium/hypertension health claim (56 FR 60825, November 27, 1991) and in the final rule for this health claim published elsewhere in this issue of the Federal Register. As discussed in these documents, it is the agency's opinion that based on the totality of publicly available scientific evidence, there is significant scientific agreement that there is a relationship between sodium and hypertension. There is also agreement that reductions in dietary sodium intake will provide a substantial public health benefit. Given the need to reduce sodium intake and the directive in the legislation that the information required in the nutrition label be conveyed to the public in a manner that enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet (section 2(b)(1)(A) of the 1990 amendments), FDA believes that a DRV for sodium is supported.

47. Some comments argued that there is no consensus regarding sodium recommendations, and that a DRV is therefore inappropriate. One comment stated that Canada provides no quantitative advice regarding sodium, and another noted that public health agencies do not agree among themselves about an appropriate recommendation. It was pointed out that the Joint National Committee (Ref. 49) described "moderate sodium intake" as 1,500 to 2,500 mg, while the Surgeon General's Report (Ref. 2) discussed a desirable range of 1,100 to 3,300 mg in noting that dietary intakes exceed this range, which was established as "safe and adequate" in the 9th edition of the NAS RDA publication (Ref. 36). The Dietary Guidelines for Americans (Ref. 5) recommend "moderation" but provide no quantitative values, while the 10th edition of the NAS RDA publication (Ref. 26) specifies a minimum intake of 500 mg but no maximum bound. The comment pointed out that the participants at the National Heart, Lung, and Blood Institute (NHLBI) Workshop held in 1989 (Ref. 50) expressed disparate views.

FDA is aware of these differences but believes that they are attributable to differences in the intended purposes of the recommendations and not necessarily to a lack of underlying agreement. In fact, these recommendations are usually expressed as a range that includes the 2,400 mg level proposed as the DRV.

The Surgeon General's Report (Ref. 2) cited the 9th edition of the NAS RDA publication (Ref. 36) that has been superseded by the more recent 10th edition (Ref. 26). The 10th edition of the NAS RDA publication identifies a minimum safe adult intake of 500 mg but also supports the level of 2,400 mg recommended in Diet and Health (Ref. 3). Diet and Health served as the basis for establishing the DRV for sodium.

The Joint National Committee (Ref. 49), in the context of hypertension detection and treatment, reported no serious adverse effects with moderate sodium restriction of 1,500 to 2,500 mg, which includes the 2,400 mg level used for the DRV. Finally, the NHLBI workshop (Ref. 50) was designed to explore current research topics and was not convened as a Federal government consensus panel, nor did it have the objective to identify a recommended intake.

Therefore, FDA believes that the level of 2,400 mg that is proposed as the DRV for sodium, and that is recommended in the major consensus report Diet and Health, is consistent with other recommendations and government reports and, thus, provides an appropriate basis for a DRV. The level of 2,400 mg is also well above the recommended minimum safe intake levels of 500 mg.

48. A few comments supported a DRV for sodium that is lower than the proposed 2,400 mg. One comment from a consumer stated that 2,400 mg seems too high. Two comments that preferred 1,800 mg argued that Diet and Health (Ref. 3) had recommended 2,400 mg as an "initial goal" and had stated that a level of 1,800 mg would probably confer greater health benefit. One of these comments supported the lower value as a way to better protect millions of Americans, especially older citizens, with hypertension.

FDA proposed a DRV for sodium of 2,400 mg based on the recommendation in Diet and Health. While this report does note that a lower value of 1,800 mg may confer greater benefit, the committee specifically recommended 2,400 mg sodium. This recommendation

was based not only on issues of health benefits but also took into consideration realistic diet modifications among American consumers. FDA, therefore, concludes that a DRV of 2,400 mg is consistent with the recommendation provided by Diet and Health. However, to guide consumers to the benefits of even lower levels, the agency is providing for the use of the phrase "less than" in the presentation of the DRV standard on the label. This label format provision is discussed in more detail in the Mandatory Nutrition Labeling final rule published elsewhere in this issue of the **Federal Register**.

49. Several comments favored a higher DRV for sodium. One comment supported 2,900 to 3,000 mg, suggesting that a reasonable interpretation of the guideline provided in the 10th edition of the NAS RDA publication (Ref. 26) was to add the recommended intake to the 500 mg minimum naturally occurring (2,400 mg + 500 mg). This approach would produce a DRV of 2,900 mg (rounded to 3,000 mg). The comment stated that this level would be more realistic than 2,400 mg. Two other comments favored the 3,000 mg level. One expressed support for the American Heart Association position which is that sodium intake should not exceed 3 g per day (Ref. 42), and another stated that 3,000 mg has been recommended by most reputable health and nutrition organizations. One comment supported 3,300 mg, and another suggested a DRV of no less than 3,500 mg for a 2,350 calorie diet. According to the comment, the latter value represented a one-quarter decrease in what the comment identified as the usual American dietary intake of 4 to 6 g of salt. The one-quarter reduction was identified as the moderate intake recommended by Dietary Guidelines (Ref. 5). Another comment supported 4,000 mg, noting that the DRV is considered by dietitians to be in the range of "low sodium" diets (less than 2,000 mg), and that the general public should not use a "low sodium" diet as a reference because consumers would wrongly believe that sodium intakes in excess of safe and adequate levels would be harmful. One comment suggested that a range from 500 to 4,600 mg would be preferable to a single value.

First, FDA does not agree that the committee responsible for the 1989 NAS RDA's intended that 2,400 mg sodium should be consumed in addition to the 500 mg identified as safe and adequate in the 10th edition of the NAS RDA publication (Ref. 26). The publication specifically states that "there is no known advantage in consuming large amounts of sodium" and references the recent NAS Diet and Health report (Ref. 3) which recommends that daily intakes of sodium chloride be limited to 2,400 mg of sodium or less. Further, FDA believes that a sodium DRV of 2,400 mg is not inconsistent with the current American Heart Association position that sodium intake should not exceed 3 g per day (Ref. 38). The agency notes that the written comments to this docket submitted by the American Heart Association did not object to the DRV of 2,400 mg for sodium (Ref. 51).

FDA remains unconvinced that there is any reason to establish a value that is higher than the 2,400 mg specified in Diet and Health. The suggested higher values are not consistently supported, whereas 2,400 mg is consistent with other Federal agency recommendations and with current public health agency policies to moderate or reduce sodium intake. Furthermore, the 2,400 mg level is a feasible goal because sodium in food is primarily present as added salt, and current dietary recommendations specify a moderate reduction that is large enough to produce significant decreases in intake while remaining well in excess of the minimum safe intake level of 500 mg specified in the 10th edition of the NAS RDA publication (Ref. 26).

50. The feasibility of achieving an intake approximating the proposed DRV of 2,400 mg of sodium was questioned by a few comments. These comments stated that the proposed DRV is not reasonable or practical, will be difficult to achieve, and will cause unnecessary frustration to consumers trying to meet the goal. One comment suggested that the proposed DRV is too restrictive for restaurant nutrition programs, which must be concerned with taste, affordability, and availability. To emphasize the difficulty of achieving daily sodium intakes of 2,400 mg, the comment referred to a recent review article on sodium intervention trials (Ref. 52) that found that daily intakes of 3,000 mg were only achievable with intensive, multifaceted interventions and highly motivated individuals. The article concluded that general population goals must be modest, or the food supply must change significantly.

FDA recognizes that the current sodium intake of many people exceeds the DRV level of 2,400 mg (56 FR 60825 at 60825), and that sodium is very prevalent in the food supply. However, the agency disagrees that intakes of 2,400 mg sodium are not feasible. Sodium is largely a discretionary addition to foods, usually as sodium chloride or table salt. In fact, estimates suggest that 90 percent of the sodium in foods is from added salt (Refs. 53 and 54) and thus can more easily be controlled by food processors and consumers than can substances in food that are naturally-occurring. Additionally, because reduced sodium intake is a recognized public health priority (Refs. 2, 3, and 5), the agency believes that it is appropriate to set the DRV at a level that is consistent with that goal and that will stimulate changes in the marketplace that are technologically feasible. Therefore, FDA is retaining the DRV of 2,400 mg for sodium (proposed as § 101.9(c)(12)(i) and redesignated below as § 101.9(c)(9)).

51. One comment suggested that the statement in FDA's proposal that the "majority of the current dietary intake of sodium results from ingestion of sodium chloride" contradicts a previous FDA statement that a substantial amount of sodium comes from nonsalt sources. The comment did not identify the FDA statements to which it was referring.

This comment infers that "substantial" and "majority" are synonymous. FDA disagrees with this comment. A dictionary definition (Ref. 55) for the word "substantial" characterizes the word as meaning of ample or considerable amount, quantity, size, etc., or of real worth, value, or effect. It does not define "substantial" as "majority." In its proposal on RDI's and DRV's, the agency referenced a statement from Diet and Health (Ref. 3) that the majority of sodium intake is from sodium chloride. This statement is not inconsistent with the agency's 1982 findings (47 FR 26590) that nonsalt sources can also provide meaningful, important, or "substantial" contributions to the diet.

M. DRV for Potassium

52. One comment suggested that the DRV's should be limited to those dietary components that are the subject of dietary guidelines. It highlighted the establishment of a DRV for potassium as scientifically unjustifiable.

As described in the proposal to this final rule, FDA has used major consensus reports in developing the DRV's. Among these is the well recognized and accepted Diet and Health (Ref. 3), published by NAS. This report specifically recommends a quantitative intake of potassium to assist in reducing the risk of stroke. FDA does not find compelling the comment's argument that, because potassium is not specifically listed in Dietary Guidelines for Americans (Ref. 5), a DRV is not justified. The Dietary Guidelines are intended to provide general food guidance and do not necessarily specify recommended intakes for individual nutrients. The agency notes that no

other comments were received expressing concern about this DRV. The agency is, therefore, retaining the DRV for potassium (3,500 mg).

Additionally, for completeness, FDA is including the listing of potassium based on its DRV value in §§ 101.3(e)(4)(ii) and 104.20(c)(1) and (d)(3).

VI. Conforming Amendments

53. One comment expressed concern that the proposed RDI's will have implications for all alternative products (e.g., reduced fat) formulated to achieve nutritional equivalency to their traditional counterparts. According to the comment, a traditional product containing nutrient levels at less than the 2 percent U.S. RDA criterion, and thus not requiring fortification of the analog, could now meet a 2 percent RDI criterion and thus fortification of the analog would be required. For example, a typical dressing contains 1.88 percent of the U.S. RDA for vitamin E. Because this amount is less than the 2 percent U.S. RDA criterion, fortification of an analog product is not required. However, under the proposed RDI's, the traditional product would contain 4.58 percent of the RDI for vitamin E, requiring fortification in an analog product if the analog did not contain this level of the nutrient. The comment questioned whether the agency intended expanded fortification of analog products with introduction of new RDI's, because the agency had failed to address identity labeling of food in packaged form (§ 101.3(e)), particularly where the definition of "nutritional inferiority" is concerned.

The agency acknowledges that the levels of nutrients chosen as the RDI's will have an effect on achieving nutritional equivalency for all alternative products formulated to be substitutes for traditional products. However, FDA believes that the levels of the RDI should not be established or influenced by the effect that they will have on how nutritional equivalency is achieved in the formulation of alternative products. Rather, they should be based on sound public health principles. FDA established the 2 percent threshold for achieving nutritional equivalency (§ 101.3(e)) because that level is a measurable amount of most nutrients in a food. The adjustment of the RDI's upward, consistent with the population coverage approach, would however limit the number of situations in which nutrient levels in traditional products were below the threshold for some U.S. RDA's but are above that threshold with respect to the RDI's.

54. One comment suggested that vitamin K, molybdenum, and chloride be removed from the list of nutrients required to meet nutritional equivalency (proposed § 101.9(c)(11)(iv) and redesignated as § 101.9(c)(8)(iv)), and that FDA should include a clear statement in § 101.3(e) that selenium, fluoride, and chromium are not to be considered for nutritional equivalency purposes. According to the comment, these nutrients are of little health significance for the general healthy population.

The agency acknowledges that an increase in the number of nutrients for which label reference values (RDI's) are established would mean that efforts to obtain nutritional equivalency may require the addition of additional nutrients to substitute foods. Furthermore, the agency agrees that some of these nutrients are not considered to be of public health interest. However, any change in what constitutes nutritional equivalency would require a reevaluation of § 101.3(e), which is beyond the scope of the 1990 amendments.

However, the agency recognizes that at this time there are no listed sources (i.e., GRAS or approved food additive) for selenium, molybdenum, fluoride, and chromium. In its proposal to this final rule, the agency failed to identify molybdenum as a nutrient without a listed source. However, despite no known issues of safety, the agency believes that it would be inappropriate to include molybdenum on a list of nutrients to be added to a food for nutritional equivalency when there are no listed sources for molybdenum. Therefore, FDA would have amended § 101.3(e)(4)(ii) to state that these elements are not required for nutritional equivalency.

However, based on the provisions of the DS Act, FDA is retaining, for the time being, the label reference values as established in current § 101.9(c)(7)(iv). Because there are no label reference values for the nutrients mentioned in the comments (i.e., vitamin K, molybdenum, chloride, selenium, fluoride, and chromium), there is no need to revise § 101.3(e)(4)(ii) to specifically exclude these nutrients. Therefore, § 101.3(e)(4)(ii) is amended to be consistent with these final regulations by referring to the Daily Reference Values (DRV's) of protein in § 101.9(c)(7)(iii) and of potassium in § 101.9(c)(9) and to the Reference Daily Intakes (RDI's) of vitamins and minerals in § 101.9(c)(8)(iv). FDA will reach a final decision on the other issues discussed in this comment following the provisions of the DS Act.

VII. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in the proposed rule on reference daily intakes and daily reference values and mandatory nutrition labeling (56 FR 60366, November 27, 1991), the agency determined that under 21 CFR 25.24(a)(8) and (a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

Several comments on the proposed rule suggested that there would be significant adverse environmental effects from the final rules unless the agency allowed more time between the publication of the final rules and their effective dates. The concern in these comments was that, if the agency did not allow firms more time between the publication of the final rules and their effective dates to use up existing label inventories, large stocks of labels and labeled packaging would have to be discarded. These comments questioned whether the agency had sufficiently examined the impact of disposing of obsolete labels and labeled packaging on this country's solid waste disposal capabilities. Two comments estimated the amounts of labeling from their respective industries, i.e., dairy and confectionery, that would need to be discarded following publication of FDA's final rules on several food labeling actions, including this action. However, these comments did not: (1) Provide details on how these estimates were derived, (2) identify what portion of the estimated amounts are attributable to these two actions, or (3) describe what impact the discarded labels and packaging would have on the disposal of solid waste. In its November 27, 1991, nutrition labeling proposed rule, the agency proposed that the final rules for these actions would become effective 6 months following their publication in the **Federal Register**.

However, the agency has decided not to make the final rule effective until May 8, 1994. FDA believes there will thus be ample time for food companies to use up most of the existing labeling and packaging stocks and to incorporate labeling language that complies with FDA's regulations into their food labels. Consequently, the comments on the potential for adverse environmental effects do not affect the agency's previous determination that no significant impact on the human

environment is expected and that an environmental impact statement is not required.

VIII. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the Federal Register of November 27, 1991 (56 FR 60856), and along with the food labeling proposals the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the Federal Register. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the Federal Register announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

List of Subjects

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

21 CFR Part 104

Food grades and standards, Frozen foods, Nutrition.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 101 and 104 are amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.3 is amended by revising paragraph (e)(4)(ii) to read as follows:

§ 101.3 Identity labeling of food in packaged form.

* * * * *

(e) * * *

(4) * * *

(ii) For the purpose of this section, a measurable amount of an essential nutrient in a food shall be considered to be 2 percent or more of the Daily Reference Value (DRV) of protein listed under § 101.9(c)(7)(iii) and of potassium listed under § 101.9(c)(9) and the Reference Daily Intake (RDI) of any vitamin or mineral listed under § 101.9(c)(8)(iv).

* * * * *

3. Section 101.9 is amended by adding paragraphs (c)(7)(iii), (c)(8)(iv), and (c)(9) to read as follows:

§ 101.9 Nutrition labeling of food.

* * * * *

(c) * * *

(7) * * *

(iii) For the purpose of labeling with a percent of the Daily Reference Value (DRV) or RDI, a value of 50 grams of protein shall be the DRV for adults and children 4 or more years of age, and the RDI for protein for children less than 4 years of age, infants, pregnant women, and lactating women shall be 16 grams, 14 grams, 60 grams, and 65 grams, respectively.

* * * * *

(8) * * *

(iv) The following RDI's and nomenclature are established for the following vitamins and minerals which are essential in human nutrition:

Vitamin A, 5,000 International Units.
Vitamin C, 60 milligrams.
Thiamin, 1.5 milligrams.
Riboflavin, 1.7 milligrams.
Niacin, 20 milligrams.
Calcium, 1.0 gram.
Iron, 18 milligrams.
Vitamin D, 400 International Units.
Vitamin E, 30 International Units.
Vitamin B_6, 2.0 milligrams.
Folic acid, 0.4 milligrams.
Vitamin B_{12}, 6 micrograms.
Phosphorus, 1.0 gram.
Iodine, 150 micrograms.
Magnesium, 400 milligrams.
Zinc, 15 milligrams.
Copper, 2 milligrams.
Biotin, 0.3 milligram.
Pantothenic acid, 10 milligrams.

(9) For the purpose of labeling with a percent of the DRV, the following DRV's are established for the following food components based on the reference caloric intake of 2,000 calories:

Food component	Unit of measurement	DRV
Fat	gram (g)	65
Saturated fatty acids	do	20
Cholesterol	milligrams (mg)	300
Total carbohydrate	grams (g)	300
Fiber	do	25
Sodium	milligrams (mg)	2,400
Potassium	do	3,500
Protein	grams (g)	50

* * * * *

PART 104—NUTRITIONAL QUALITY GUIDELINES FOR FOODS

4. The authority citation for 21 CFR part 104 continues to read as follows:

Authority: Secs. 201, 403, 701(a) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 343, 371(a)).

5. Section 104.20 is amended in paragraph (a) by removing "U.S. RDA's" the two times it appears and replacing it with "Reference Daily Intakes (RDI's)" and "RDI's", respectively, and by revising paragraphs (c)(1) and (d)(3) to read as follows:

§ 104.20 Statement of purpose.

* * * * *

(c) * * *

(1) The nutrient is shown by adequate scientific documentation to have been lost in storage, handling, or processing in a measurable amount equal to at least 2 percent of the Daily Reference Value (DRV) of protein and of potassium and 2 percent of the Reference Daily Intake (RDI) in a normal serving of the food.

* * * * *

(d) * * *

(3) The food contains all of the following nutrients per 100 calories based on 2,000 calorie total intake as a daily standard:

Nutrient	Unit of measurement	DRV or RDI[1]	Amount per 100 calories
Protein	grams (g)	50	2.5
Vitamin A	International Unit (IU)	5,000	250
Vitamin C	milligrams (mg)	60	3
Calcium	g	1	0.05
Iron	mg	18	0.9
Vitamin D	IU	400	20
Vitamin E	do	30	1.5
Thiamin	mg	1.5	0.08
Riboflavin	do	1.7	0.09
Niacin	do	20	1
Vitamin B_6	do	2.0	0.1
Folate	micrograms (µg)	400	20
Vitamin B_{12}	do	6.0	0.3
Biotin	mg	0.3	0.015
Pantothenic acid	do	10	0.5
Phosphorus	g	1.0	0.05
Magnesium	mg	400	20
Zinc	do	15	0.8
Iodine	µg	150	7.5
Copper	mg	2.0	0.1
Potassium	do	3,500	175

[1] RDI's for adults and children 4 or more years of age.

[Docket No. 90N–0165]

RIN 0905–AD08

Food Labeling; Serving Sizes

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending its nutrition labeling regulations to: (1) Define serving size on the basis of the amount of food customarily consumed per eating occasion; (2) establish reference amounts customarily consumed per eating occasion (reference amounts) for 139 food product categories; (3) provide criteria for determining label serving sizes from the reference amounts; (4) require the use of both common household and metric measures to declare serving sizes; (5) define a "single-serving container;" (6) require that the use of claims such as "low sodium" be based on the reference amount; (7) permit the declaration of serving size in U.S. measures (ounces (oz), fluid ounces (fl oz)); and (8) permit the optional declaration of nutrient content per 100 grams (g) or 100 milliliters (mL). This action is in response to the requirements of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments).

EFFECTIVE DATE: May 8, 1994.

SUPPLEMENTARY INFORMATION:

I. Background

A. Proposed Regulation, Nutrition Labeling and Education Act of 1990, and Institute of Medicine's Report on Nutrition Labeling

In the **Federal Register** of July 19, 1990 (55 FR 29487), FDA published a proposed rule entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" to amend its food labeling regulations to require nutrition labeling on most food products that are meaningful sources of nutrients. In the same issue of the **Federal Register** (55 FR 29517), FDA published a technical supporting proposal entitled "Food Labeling; Serving Sizes" (hereinafter referred to as the 1990 proposal).

The 1990 proposal on serving sizes stated that in view of the many comments that the agency had received stating the need for more realistic and consistent serving sizes, FDA had concluded that reasonable and standardized serving sizes should be established. The agency proposed to amend the nutrition labeling regulations to: (1) Define serving and portion size on the basis of the amount of food commonly consumed per eating occasion by persons 4 years of age or older, by infants, or by children under 4 years of age (toddlers); (2) require the use of both U.S. and metric measures to declare serving size; (3) permit the declaration of serving (portion) size in familiar household measures; (4) permit the optional declaration of nutrient content per 100 g or 100 mL; (5) define "single-serving containers" as those that contain 150 percent or less of the standard serving size for the food product; and (6) establish standard serving sizes for 159 food product categories to ensure reasonable and uniform serving sizes upon which consumers can make nutrition comparisons among food products. Interested persons were given until November 16, 1990, to submit comments to the agency on the 1990 proposal.

On September 26, 1990, the National Academy of Sciences' Institute of Medicine (IOM) issued a report entitled "Nutrition Labeling, Issues and Directions for the 1990s" (hereinafter referred to as the IOM Report) (Ref. 1). The IOM report was written under contract to the Public Health Service, U.S. Department of Health and Human Services (DHHS) and the Food Safety and Inspection Service, U.S. Department of Agriculture (USDA). On October 5, 1990, FDA published a notice in the **Federal Register** (55 FR 40944) announcing the availability of the IOM report and requesting that interested persons comment on the implications of the report for the agency's July 19, 1990, proposals on food labeling. The report made several recommendations related to serving sizes.

On November 8, 1990, the President signed into law the 1990 amendments (Pub. L. 101–535). The 1990 amendments added section 403(q) to the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 343(q)). Section 403(q) of the act specifies, in part, that:

> * * * the serving size * * * is an amount customarily consumed and which is expressed in a common household measure that is appropriate to the food, or * * * if the use of the food is not typically expressed in a serving size, the common household unit of measure that expresses the serving size of the food.

The 1990 amendments also require, in section 2(b)(1)(B), that FDA adopt regulations that: "* * * establish standards * * * to define serving size or other unit of measure for food, * * *."

While the requirements of the 1990 amendments that pertain to serving size are similar in many respects to FDA's 1990 proposal, differences exist, and questions about the exact meaning and the implementation of those provisions have been raised.

On February 26, 1991 (56 FR 8084), FDA announced a public meeting to discuss several issues arising from the comments on the serving size proposal, the 1990 amendments, and the IOM report. The meeting was held on April 4, 1991 (hereinafter referred to as the 1991 public meeting), and provided an opportunity for the public to submit oral and written comments on the issues identified in the notice.

B. The 1991 Serving Size Regulation

FDA carefully considered the serving size provisions of the 1990 amendments, the comments that it received in response to the **Federal Register** documents on serving size and at the 1991 public meeting, and the recommendations related to serving size contained in the IOM report. As a result, the agency decided to repropose the serving size regulation for two major reasons. First, FDA wished to take advantage of the explicit legal authority provided by the 1990 amendments to regulate the serving sizes used on the nutrition label. Secondly, the agency decided to make a number of changes in response to the comments received on the **Federal Register** documents and at the public meeting on serving sizes and to explain its reasons for agreeing or not agreeing with the comments.

To implement the 1990 amendments, FDA issued a proposed rule in the **Federal Register** of November 27, 1991 (56 FR 60394; corrected at 57 FR 8179, March 6, 1992) (hereinafter referred to as the 1991 serving size proposal). In that document, FDA proposed to: (1) Modify the definition of serving size in the 1990 proposal to be consistent with that in the 1990 amendments; (2) adopt regulations that provide standards for defining serving sizes; and (3) require the use of both common household and metric measures to declare serving sizes. The proposed standards had two basic elements: (1) Reference amounts of food that are customarily consumed per eating occasion for 131 product categories; and (2) procedures for determining serving sizes for use on

product labels from the reference amounts. The second element was necessary because while the reference amounts are defined primarily in metric units, under the act the serving sizes must be expressed in common household measures that are appropriate to the particular food.

In addition, in response to the many requests for changes in other aspects of the 1990 proposal and on its own initiative, the agency proposed to: (1) Revise the definition for single-serving containers to increase the upper limit from "150 percent or less" to "less than 200 percent;" (2) revise the basis for evaluating label claims such as "low sodium" to include both the declared serving size and the reference amount; (3) permit the optional declaration of serving size in U.S. measures; and (4) permit the optional declaration of nutrient content per 100 g, 100 mL, 1 oz, or 1 fl oz. Interested persons were given until February 25, 1992, to submit comments to the agency on the 1991 serving size proposal.

On January 3, 1992 (57 FR 239), FDA announced a public hearing to discuss all of the agency's proposed food labeling regulations that implement the 1990 amendments. The hearing was held on January 30 and 31, 1992 (hereinafter referred to as the 1992 public hearing). Some of the presentations and written comments submitted in response to this hearing discussed issues related to serving sizes.

This final rule responds to the written comments received on the 1991 serving size proposal and the written comments and presentations given at the 1992 public hearing on issues related to serving sizes.

II. Review of Comments

FDA received about 700 comments on the 1991 serving size proposal. Approximately 50 percent were from domestic food industries and trade organizations; about 35 percent were from consumers and consumer organizations; about 10 percent were from health professionals, health and other professional organizations, and academia; about 5 percent were from Federal, State, and local government; and less than 1 percent was from foreign industries and governments.

About 20 oral presentations at the 1992 public hearing discussed issues related to serving sizes. A written transcript of the meeting is on file with Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857. FDA also received written comments that discussed issues related to serving sizes in response to the notice of the public hearing. Issues discussed at the hearing mostly reiterated the issues discussed in written comments on the 1991 serving size proposal. Therefore, a separate evaluation has not been done for the comments received in response to the 1992 public hearing. FDA will respond to these comments together with all comments received in response to the 1991 serving size proposal.

Consumers overwhelmingly supported the provisions in the 1991 serving size proposal and again emphasized the need for realistic and standardized serving sizes. Health professionals and nutritional or health professional organizations generally supported the provisions in the 1991 serving size proposal. Many industry and trade associations supported the general approach that FDA took in the 1991 serving size proposal. However, they often disagreed with specific aspects of the procedures used to determine reference amounts, specific reference amounts, or some other specific aspects of the 1991 serving size proposal. International comments again emphasized the need for international harmonization of food labeling (e.g., these comments usually recommended the use of 100 g (or mL) as the basis for the nutrition information).

The agency will describe the comments on serving sizes in more detail and respond to them by topic in the discussion of the final regulation that follows.

III. The Final Regulation

A. Legal Authority

1. A manufacturer contended that the 1990 amendments did not mandate that FDA establish, by regulation, specific serving sizes for each food. The comment objected to FDA taking away its right to set serving sizes within the broad parameters of being reasonable, fair, and consistent. The comment stated that the 1990 amendments authorized FDA to establish standards or guides that the manufacturer must follow when the manufacturer sets the specific serving size. A trade association stated that FDA's proposed "device" of reference amounts does not qualify as standards because when reference amounts are applied using the proposed procedures, they amount to specific serving sizes. Another industry comment stated that some reference amounts were expressed in common household measures (e.g., cups, tablespoon (tbsp.)), and therefore, label serving sizes in common household measures will be the same as the reference amount. This, the comment argued, disqualifies these reference amounts from being standards.

FDA disagrees with the comments. First, FDA did not establish "specific serving sizes" for each food. The agency established a system that consists of the two basic elements described above. A manufacturer uses these elements to determine the serving size most appropriate for specific products. The fact that a manufacturer has relatively limited discretion within that system does not represent an infirmity in the system. Section 403(q)(1)(A)(i) of the act establishes the fundamental principle for determining serving size. This principle is much more specific than as one comment suggested, that the amount be reasonable, fair, and consistent. The act requires that the serving size be an amount of the food that is customarily consumed

The legislative history in section 2(b)(1)(B) of the 1990 amendments is silent as to what type of standards that Congress contemplated in that section It merely directs the agency to establish them (H Rept. 101–538, 101st Congress, 2d sess. 18 (1990)). (See also the House report at page 7: "In order to make this information meaningful, the bill requires the FDA to issue standards providing that uniform serving size information and information concerning the number of servings be furnished on the food label." Thus, the question as to whether the standards that FDA proposed are adequate and consistent with the act really becomes a question of whether the serving size that results from applying that standard represents an amount customarily consumed Significantly, none of these comments claimed that it does not Consequently FDA concludes that the two element system that it proposed in the 1991 serving size proposal constitutes a standard for determining serving sizes that is consistent with the act.

2. An industry comment stated that the 1990 amendments give FDA the legal authority to use any unit of measure (not necessarily a serving based on customarily consumed amounts) that it deems most appropriate for expressing the nutrient content of foods The comment stated that food consumption surveys, such as the Nationwide Food Consumption Survey (NFCS) conducted by USDA, do not provide "real" consumption values, because there are too many varieties of different foods, different uses of the same foods, different foods for the same use, and other variables, and because there is too much diversity in individual consumption to establish any sort of meaningful or representative consumption standard The comment

asserted that as long as competitive products are given the same serving size value, it is not that important whether there is valid supporting data. The comment recommended the use of "reference nutrition units" that would eliminate the idea that the serving size represents what people really eat. Under the system suggested by this comment, all foods would be given a reference point that represents a reasonable quantity of food for a given category, and all competitive foods would be given the same reference point.

FDA disagrees with the comment that the 1990 amendments allow the agency to use any unit of measure that it deems most appropriate for expressing the nutrient content of foods. Section 403(q)(1)(A)(i) of the act clearly defines serving size as an amount of food customarily consumed. As discussed in the 1991 serving size proposal (56 FR 60394 at 60400), FDA is well aware of the high variability in the amounts customarily consumed by individuals, as well as other factors such as many different uses of the same food and many different foods for the same use. These issues complicate the process for determining reference amounts. However, FDA continues to believe that by using data from national food consumption surveys, such as the NFCS, and by following the principles and procedures that it described in the 1991 serving size proposal, a reasonable reference amount that represents the amount of food customarily consumed within each product category can be determined for the major usage of the food.

FDA also disagrees with the comment that stated that as long as competitive products are given the same serving size value, valid supporting data are not important. FDA does not believe that the only intent of the 1990 amendments is to establish the same serving size for competitive products. FDA believes that the intent is also to ensure that nutrition information will be based on a meaningful quantity of food, the amount customarily consumed. Competitive foods often differ in characteristics (e.g., density) that affect the amount customarily consumed. For example, ready-to-eat breakfast cereals compete with one another, but their densities (g per cup) differ widely, from less than 20 g per cup to over 120 g per cup. Food consumption data show that the amount customarily consumed depends on the density of the cereal. Therefore, the same serving size should not be used for all ready-to-eat breakfast cereals. In this case using the same serving sizes for competitive products could be misleading to consumers.

B. Definition of Serving Size

In accordance with the 1990 amendments, FDA proposed in § 101.9(b)(1) to define "serving" or "serving size" to mean:

> an amount of food customarily consumed per eating occasion by persons 4 years of age or older which is expressed in a common household measure that is appropriate to the food. When the food is specially formulated or processed for use by infants or by toddlers, a serving or serving size means an amount of food customarily consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age, respectively.

In the same section, FDA proposed to define "portion" to mean "an amount of a food that is not typically expressed in a serving size, i.e., a food customarily used only as an ingredient in the preparation of other foods, (e.g., 1/4 cup flour or 1/4 cup tomato sauce)."

Over 75 percent of the approximately 80 comments that addressed the definition of serving size agreed with FDA's proposal for the definition of serving size. These comments pointed out that the act explicitly states that the serving size shall be an amount customarily consumed in terms of a common household measure appropriate to the food, and that thus FDA's proposed definition is consistent with the requirements of the act. Approximately 25 percent of the comments received on this issue disagreed with FDA's proposal. The reasons for the disagreement, and the definitions suggested in these comments, are discussed below.

3. Several comments stated that FDA should use the serving sizes in the diabetic exchange list as the serving sizes for nutrition labeling of food because they are already in use, and because people are familiar with the serving size contained in the exchange list.

FDA disagrees with these comments. Section 403(q)(1)(A)(i) of the act defines serving size as "an amount customarily consumed." Thus, the act links serving size to the amount consumed. Serving sizes contained in the diabetic exchange list are not based on amounts customarily consumed by the American public. They are tailored to meet a special dietary need of a subpopulation that has a unique health problem. They are inappropriate to use as serving sizes for the nutrition labeling of products for the general population because the serving sizes for a population with a medical problem do not necessarily reflect the consumption practices of the general healthy population. For example, to facilitate achievement of medical goals of this subpopulation, the serving sizes in the exchange lists are based on the calorie content and the energy-producing macronutrient content of specific foods and may not, as required by the act, reflect amounts of food customarily consumed by average consumers. The 1991 serving size proposal discussed in detail the reasons why FDA cannot use the serving sizes contained in the diabetic exchange list for the nutrition labeling of food (56 FR 60394 at 60399). None of the comments provided any basis for finding that that discussion was wrong. Therefore, FDA has not modified the definition of "serving size" in response to these comments.

4. International comments and several U.S. manufacturers opposed nutrition information based on serving sizes. Some pointed out that the European Community directive requires that all nutrition information be on a 100 g or 100 mL basis. The comments argued that requiring nutrition information on a per serving basis offers little consistency with nutrition labeling in other countries and creates a significant trade barrier.

FDA recognizes that many foreign countries use 100 g or 100 mL as the basis for nutrition labeling. However, the act requires that the nutrition information be provided on a per serving basis. The act also defines serving size as an amount customarily consumed which is expressed in a common household measure that is appropriate to the food. The 100 g or 100 mL does not represent an amount customarily consumed for many foods. In addition, g and mL are not common household measures in the United States. Therefore, FDA cannot use 100 g or 100 mL as the basis for the primary serving size. However, partly to facilitate the utility of the serving size in the international community, FDA is requiring in new § 101.9(b)(7) that the equivalent metric quantity be declared on the label in addition to the serving size in a common household measure and is permitting, in new § 101.9(b)(10)(i), a voluntary listing of a second column of values on a per 100 g or 100 mL basis.

5. Several industry and consumer comments suggested using 1 oz for the serving size rather than customarily consumed amounts. The comments contended that: (1) A uniform 1-oz serving size allows nutrition comparisons of all foods; (2) nutrition information per oz allows calculation of the nutrient content of food per serving of an individual's choice; and (3) the word "serving" is confusing and should be eliminated. Another consumer comment argued that few people

measure out a serving of a product as noted on packages. Most people just pour an amount that they feel is reasonable or desirable. Therefore, it is not necessary to have standard serving sizes. Rather, FDA should use 1 oz as the basis for nutrition information.

As discussed above, section 403(q)(1)(A)(i) of the act requires that serving sizes be in amounts customarily consumed. Because 1 oz is not an amount customarily consumed for many products, FDA cannot use 1 oz as the basis for nutrition information for all products.

6. Some consumer comments suggested defining serving size as the amount consumed by adult females. The comments stated that females need smaller amounts of food to maintain good nutrition and health. The comments were concerned that if serving sizes are based on the amount consumed by adult males, the quantity will be too large for females. Another consumer comment suggested that FDA define serving size as the amount consumed by a "middle consumption group between youth and men." The comment contended that if the serving size is set at a middle consumption level, it would be "easier to decrease for youth and increase for men."

FDA believes that these comments misunderstand the purpose of a serving size on product labels. The serving size declared on the product label is not an amount recommended for consumption. It is, by statute, the amount customarily consumed. FDA believes that promoting recommended servings can best be addressed through public education. The agency's promulgation of nutrition labeling regulations will be followed by a consumer education program to assist consumers in using the nutrition information on the label, including how nutrition information based on labeled serving size should be adjusted on the basis of an individual's actual or recommended serving size. FDA is currently planning for these activities.

The general food supply is consumed by the general population which is defined, for regulatory purposes, as all persons 4 years of age or older. Therefore, serving sizes should reflect the amounts customarily consumed by the general population and not by any selected age or sex group (e.g., adult male or female) within the general population.

7. An industry comment stated that the phrase "per eating occasion" should be deleted from the definition of serving size because small amounts of food consumed, such as for tasting during food preparation, could be counted as an eating occasion.

FDA does not believe that the issue raised by this comment presents a problem. The term "eating occasion" in food consumption surveys usually refers to meals and snacks. Even if the small amounts of food consumed during tasting are included in determining the amount of food customarily consumed per eating occasion, the general principles and factors (e.g., use of the mean, median, and modal consumed amount per eating occasion) considered by FDA in arriving at the reference amounts ensure that such infrequently reported small amounts would not affect the determination of the amount customarily consumed per eating occasion. Furthermore, deletion of the term "per eating occasion" would leave the definition of serving size open-ended, which would likely result in more inconsistencies among serving sizes. Therefore, FDA is retaining the term "per eating occasion" as part of the definition for serving size.

8. A consumer comment stated that because different units are used for serving size (e.g., oz, tbsp.) and nutrition information (e.g., g), the current nutrition information is not useful to estimate the percent of a nutrient (e.g., fat) in the product. The comment stated that expressing both serving size and nutrition information in g would facilitate computation of the percentage of a nutrient in the product. The comment, therefore, suggested that FDA mandate that the nutrition information of all products be provided on a per 100-g basis, instead of common household measures.

FDA understands the consumers' desire for information on the percentage of fat in the product. However, the act mandates that the primary unit for the serving size should be a common household measure that is most appropriate to the specific product. Therefore, serving sizes will continue to be expressed in common household measures (e.g., cups, tbsp., oz). However, FDA notes that it is also requiring metric equivalents of the household measures (e.g., 1 cup (55 g)). Therefore, nutrition information on a per 100-g basis is not necessary to facilitate such computation. Consumers who desire information on the percentage of a nutrient in the product should be able to calculate this number from the metric equivalent of the serving size and the amount of the nutrient, expressed in g.

9. A trade association stated that industry makes no distinction between the terms "serving" and "portion." The comment contended that FDA's definition is not consistent with the industry's usage of "portion." Limiting the term "portion" for use with products that are used primarily as ingredients (e.g., flour, tomato sauce) creates more confusion in terminology and contributes nothing to nutrition labeling.

FDA agrees with this comment. Because foods such as flour and tomato sauce are not served by themselves but as part of other foods, conceptually the term "serving" may not be as appropriate as the term "portion" as defined in the 1991 serving size proposal. However, FDA acknowledges that many manufacturers use "serving" and "portion" interchangeably. These terms are also used interchangeably in the literature (Ref. 37). FDA also recognizes that consumers are not likely to distinguish between the two terms, and that the use of two different terms on the label could be confusing. For these reasons, FDA is deleting the definition of "portion" from new § 101.9(b)(1).

C. Definition of Single-Serving Container

FDA proposed in § 101.9(b)(6) to define a single-serving container as a product that is packaged and sold individually containing less than 200 percent of the applicable reference amount. (Section 101.9(b)(6) of the 1991 serving size proposal had a typographical error and stated "packaged or sold individually" instead of "packaged and sold individually.") The agency proposed to require that the entire content of such products be labeled as one serving. In addition, the agency proposed that packages sold individually that contain 200 percent or more of the applicable reference amount may be labeled as a single-serving if the entire content of the package can reasonably be consumed at a single eating occasion.

FDA received many comments on issues related to the definition of a single-serving container. About half of the comments agreed with the proposed definition. The other half, mostly industry comments, opposed or had reservations on some aspects of the proposed definition.

10. The majority of the comments disagreeing with the proposal objected to the proposed upper limit of "less than 200 percent." These comments argued that FDA provided insufficient reasons for increasing the upper limit from 150 percent to 200 percent of the reference amount, placing considerable importance on a few new single-serving products, such as buffet cans of canned fruit with pop-tops and king-sized candy bars. The comments stated that FDA ignored many other products on

the market for which the 200 percent cutoff level would be unreasonably high. Examples given included 6 oz cans of tuna, 10 oz cans of canned fruits, 9 oz cans of canned vegetables, and 15 to 16 oz cans of ready-to-serve soup or entrees (e.g., chili with beans, spaghetti). These comments recommended that the upper limit be lowered to 150 percent of the reference amount. Several other comments recommended that FDA allow manufacturers to decide whether a package containing 150 to 200 percent of the reference amount is a single serving.

FDA originally proposed 150 percent of the standard serving size (equivalent to the reference amount in the 1991 serving size proposal) for the upper limit (55 FR 29487, July 19, 1990). Several comments and presentations at the 1991 public meeting on serving sizes argued that single-serving packages that are larger than 150 percent of the "standard serving sizes" are not uncommon in the market and may be increasing in number. The agency had also learned, from its own observations in the marketplace, of a trend towards larger "single-serving" packages (e.g., snacks). Therefore, in the 1991 serving size proposal, FDA proposed to change the upper limit for the single-serving container from "less than or equal to 150 percent" to "less than 200 percent."

After careful examination of all comments for and against the 200 percent upper limit, the agency concludes that 200 percent of the reference amount is a more reasonable cutoff level for most products than 150 percent. If FDA lowered the upper limit for single-serving containers to 150 percent of the reference amount as the comments suggested, many foods that are clearly intended for one serving (e.g., 1.8 oz snacks, 1.7 oz candy bars) could be labeled as 2 servings. The agency does not believe that such a result would represent the amount that people customarily consume; therefore, representing such foods as two servings would be confusing and misleading to consumers.

However, FDA agrees with the comments that the 200 percent cutoff level may be too high for some products (e.g., canned fruits and vegetables, soups, and entrees). The reference amounts of these products are very large compared to many other products, and examination of food consumption data showed that the average variability (defined as the standard deviation as a percent of the mean) in the amount customarily consumed for foods having a reference amount of 100 g (or mL) or larger is about two-thirds of the variability for foods having a reference amount less than 100 g (Ref. 38). In other words, it is much less likely that a person will consume approximately twice the reference amount of a food with a reference amount of 100 g or more than it is that he or she would consume twice the reference amount of a food with a smaller reference amount. The agency has therefore concluded that for those products that have reference amounts of 100 g (or mL) or larger, 150 percent is a more reasonable cutoff for a single-serving container. Therefore, FDA is revising § 101.9(b)(6) to allow manufacturers to determine whether there are 1 or 2 servings in packages that contain more than 150 percent but less than 200 percent of the reference amount if the food in the package has a reference amount of 100 g (or mL) or larger.

The agency, however, also concludes that regardless of the package size, a product that is obviously intended to be consumed in one serving (e.g., one unit products in discrete units such as muffins, ice cream bars, and sandwiches; products bearing label descriptions that suggest a single serving such as "singles" or "the perfect size for one") must be labeled as one serving. Otherwise, the labeling will be misleading under section 403(a) of the act.

11. An organization of nutrition professionals recommended changing the upper limit for single-serving containers to include 200 percent of the reference amount, so that 16 fl oz soft drinks would be required to be labeled as one serving. An organization of health professionals urged FDA to require that snack foods provide nutrition information for the entire contents of the package, regardless of the declared serving size. The organization stated that such a requirement would reflect "more accurately consumption patterns for these products."

FDA does not believe that it is appropriate to change the definition of a single-serving container so that certain sizes of a selected class of products can be labeled as a single serving or to set a different requirement for a selected class of products without food consumption data or a scientifically sound basis that supports such a different requirement. The comments did not present any food consumption data or other scientific basis that would justify the suggested changes in the definition of single-serving containers. Therefore, FDA has not adopted these recommendations.

12. Several industry comments requested that the definition of a single-serving container be eliminated, and that nutrition information on all containers be based on the reference amount. The comments requested that the agency, if it chooses to retain the single-serving container definition, allow dual labeling of nutritional values for single-serving containers (i.e., per reference amount and per entire contents of the container). The comments expressed concern that the single-serving container definition would result in different nutrition information on the labels of the same food product found in different sized containers. The comments argued that: (1) Consumers would be confused by such information, and (2) consumers would not be able to compare nutritional values of different brands of the same food because they come in different single-serving sizes. Therefore, these comments contended that FDA should allow manufacturers to voluntarily provide a second column of values based on the reference amount. A few of the comments that supported dual labeling also preferred that the required nutrition information be based on the reference amount, not on the entire contents of the container. However, a large number of consumers requested that FDA require that nutrition information on single-serving products be provided for the entire contents of the container.

FDA recognizes that the proposed rule could result in different nutritional values appearing on the labels of the same food product contained in different container sizes. Whether this would be confusing to consumers was discussed at the 1991 public meeting. In the notice of public meeting, the agency specifically requested views and data on whether differences in the listing of the nutritioal content of the same food in different container sizes would be confusing to consumers. No data on this issue were presented at the meeting or in written comments. Comments on the 1991 serving size proposal again claimed that different nutrition information on the same food found in different-sized containers would be confusing to consumers. However, the comments did not submit any data to support their claim. Considering the strong consumer support for the nutrition information based on the entire contents of the container, and in the absence of any data showing that the nutrition information based on the entire contents of the container would be confusing to consumers, the agency has concluded that the definition of single-serving container should be retained, and that nutrition information

of the single-serving containers should be based on the entire contents of the container.

With regard to the requests for dual labeling of single-serving containers, the agency does not believe that it is appropriate under the act. Because, by definition, a single-serving container has a number of servings of 1, nutrition information based on the reference amount would have a fractional number of servings (e.g., 1.4 servings). Consumers repeatedly complained about fractional number of servings on a single-serving container and asked that FDA require manufacturers to provide nutrition information based on the entire contents of the single-serving containers. Thus, there is strong evidence in the record to conclude that presenting a second column of nutrition information based on the reference amount on the single-serving containers will be confusing to consumers. The agency also notes that such information will clutter the label on the already limited space devoted to nutrition labeling. In considering whether to grant this request, FDA considered permitting dual labeling with the number of servings left blank. However, such labeling would fail to include a material fact—how many servings are being provided. Thus, such an approach is not acceptable under the act. Therefore, for these reasons, FDA is rejecting this request.

13. A manufacturer expressed confusion about the definition of single-serving containers. While the preamble of the 1991 serving size proposal specifically stated that no lower limit for the definition of a single-serving container is being established, proposed § 101.9(b)(2)(i) stated, "If a unit weighs 67 percent or more, but less than 200 percent of the reference amount, serving size shall be one unit." The comment interpreted this provision to mean that the lower limit for single-serving containers is 67 percent of the reference amount. The comment also requested clarification on how to label single-serving containers that contain less than 100 percent of the reference amount.

The comment confused a single-serving unit of products in discrete units (e.g., muffin, sliced bread, apple) in a multiunit, and thus multiserving, container with a single-serving container. For products in discrete units that come in multiserving containers, new § 101.9(b)(2)(i) describes the procedure to convert the reference amounts in new § 101.12(b) to label serving sizes in common household measures. Products in discrete units come in many different sizes. To promote uniformity in the serving sizes of similar products, FDA proposed in the 1991 serving size proposal that a unit that weighs at least 67 percent or more, but less than 200 percent, of the reference amount be called a single-serving unit. (The lower limit of the single-serving unit in the final regulation has been changed from 67 percent or more to more than 50 percent (see section III.E.1. of this document).) This provision (new § 101.9(b)(2)(i)) applies to products in discrete units that come in multiserving packages (e.g., sliced products, small candy bars), but it does not apply to single-serving containers.

A single-serving container is a product that is packaged and sold individually and that contains less than 200 percent of the reference amount. As discussed in the 1991 serving size proposal (56 FR 60394 at 60398), FDA did not consider that a lower limit for the single-serving containers was necessary because the agency proposed to base the qualification for claims on the reference amount and the label serving size. The use of the reference amount for the claim evaluation would prevent a single-serving container from qualifying for a descriptor based on the package size alone. Therefore, concern about the potential manipulation of single-serving container sizes to qualify for a "low" claim (e.g., a 1/2 oz. bag of potato chips making a "low sodium" claim) was eliminated. Because there is no lower limit for a single-serving container, a product that is packaged and sold individually and that contains less than the upper limit of the single-serving container must be labeled with the entire contents of the package being one serving. For example, if a muffin that weighs 45 percent of the reference amount is packaged and sold individually, it is a single-serving container product, and the nutrition information is to be provided per the entire content of the container, i.e., one muffin. The agency notes, however, that if a number of these muffins are packaged in a multiserving container, the label serving size for this multiserving container would be the number of muffins that most closely approximates the reference amount, i.e., in this case two muffins.

To avoid any potential confusion, FDA has modified new § 101.9(b)(2) to clearly state that single-serving containers are exempted from the general rule set forth in that section. The modified provision reads: "Except as provided in paragraphs (b)(3), (b)(4), and (b)(6) of this section, * * * serving size declared on a product label shall be determined from the 'Reference Amounts Customarily Consumed Per Eating Occasion' * * *." Single-serving containers are discussed in § 101.9(b)(6).

14. An industry comment did not object to a manufacturer voluntarily listing a product as a single serving if it is slightly greater than 200 percent of the reference amount, provided that this claim was preapproved by FDA. A nutrition professional organization also recommended preapproval of the single-serving status of a package that contains 200 percent or more of the reference amount.

FDA finds no basis to conclude that preapproval is necessary. Because the regulation requires that the serving size for single-serving containers or units (single-serving products) be the entire contents of the container or unit, FDA expects that the manufacturer's decision to declare products that contain 200 percent or more of the reference amount as a single serving will be self-limiting. As the size of the single-serving product increases, the nutrition information will show proportionately larger amounts of nutrients. Although a larger size of single-serving product will show larger amounts of nutrients having positive connotations (e.g., calcium, fiber), most foods also contain nutrients having negative connotations (e.g., calories, fat, sodium). Therefore, single-serving products that are good sources of nutrients with positive connotations will also show larger amounts of nutrients with negative connotations. FDA thus does not anticipate that there will be abuse of this option. In addition, the agency can control obvious abuses of this option under section 403(a) of the act.

15. A consumer organization expressed concern that the proposed upper limit restriction may lead to the declaration of two servings for obviously single-serving products (e.g., a large candy bar, ice cream bar, frozen dinner) that contain slightly more than 200 percent of the reference amount. The comment contended that consumers would be misled by a label that gives nutrition information for half of the obviously single-serving products. The comment requested that FDA require manufacturers to disclose how many servings the package contains on the front panel of packages that contain between 200 and 300 percent of the reference amount.

FDA does not believe that it should require the number of servings on the front panel of products that contain more than the upper limit for the single-serving container. The agency is concerned that such a requirement would result in an information overload, contribute to the space problem for single-serving containers,

and clutter the label. Moreover, to have a clear, readily understandable, and usable definition for "single-serving container," FDA finds that it is appropriate to adopt less than 200 percent of the applicable reference amount as the defining level. However, the agency recognizes the comment's concern. FDA's position, as stated earlier in this section, is that regardless of the package size, a product that is obviously intended to be consumed in one serving (e.g., one unit products in discrete units such as muffins, ice cream bars, and sandwiches; products bearing label descriptions that suggest a single serving such as "singles" and "the perfect size for one") must be labeled as one serving. If it is not, the labeling of the product will be misleading under section 403(a) of the act. Therefore, FDA concludes that no action in response to the comment is necessary.

16. An industry comment stated that, in determining whether a product meets the definition of a single-serving container, it is not clear whether the exact weight of an oz (i.e., 28.35 g) or a rounded value of 30 g or 28 g should be used to calculate the percent of the reference amount from the net oz weight of the package.

The Compliance Policy Guides (7150.17) define 1 oz as 28.34952 g for metric declarations of quantity of contents on product labels (Ref. 39). Therefore, manufacturers should use 28.35 g to convert the oz weight of the package to the g weight.

To calculate the percentage of the reference amount from the net weight of the package, because it is a determination made on a weight/weight basis, manufacturers should divide the net weight of the package in g by the reference amount of the product and multiply by 100. For example, the percent of a reference amount of a product having a net weight of 1.3 oz and a reference amount of 30 g would be [(1.3 x 28.35)/30] x 100, i.e., 123 percent.

For the purpose of expressing the serving size for nutrition labeling, new § 101.9(b)(5)(iv) defines 1 oz as 28 g. Therefore, to express the serving size, manufacturers should use 28 g to convert the serving size in oz to the g-weight equivalent.

D. Reference Amounts for Serving Sizes

To comply with the act with respect to serving sizes, FDA proposed, in § 101.12(b), reference amounts customarily consumed for 131 product categories, covering almost all food products that are regulated by FDA. FDA proposed that these reference amounts be used as the basis for determining serving sizes for specific products. FDA set forth the methodology (general principles and procedures) by which it arrived at the 131 reference amounts. FDA also proposed general rules for determining reference amounts for several product classes, including: (1) Products that require further preparation before consumption; (2) imitation or substitute foods, altered foods, and foods for special dietary use; and (3) products consisting of 2 or more foods having individual reference amounts. This section discusses the comments received on the methodology that FDA used to determine the reference amounts, the number and names of product categories, the reference amounts for specific product categories, the reference amounts for special product classes mentioned above, and how to express or present the reference amounts.

1. Methodology for determining reference amounts

This section discusses comments that addressed the general principles and procedures for determining the reference amounts. Comments that discussed the methodologies for determining the reference amounts for specific product categories are included in section III.D.5. of this document, which discusses issues related to the reference amounts for specific categories.

17. Some comments objected to using food consumption data as the primary source in determining the reference amounts. The reasons for this objection varied. Some comments reasoned that food consumption data have many limitations, and therefore it is not possible to derive accurate estimates of the customarily consumed amounts from such data. Other objections included that: (1) Food consumption data, such as the NFCS used by FDA, contain only a limited number of days of information (e.g., 3 days) and are not appropriate to use to determine "long-term" intake, and (2) reference amounts should be based on what people should eat rather than what they usually eat. The comments recommended using other sources of information such as industry's "longstanding" serving sizes, the serving sizes currently used by industry, or the serving sizes in dietary guidance documents. Some industry comments also stated that changing the currently used serving sizes would be confusing to consumers. Other comments, however, opposed the use of industry's "longstanding serving sizes or opposed the use of any data other than food consumption data, arguing that they do not fulfill the act's requirement that the serving sizes reflect amounts customarily consumed.

Section 403(q)(1)(A)(i) of the act, which states that a serving size is the amount customarily consumed, effectively requires the use of food consumption data as the primary basis for determining serving sizes. Without such data, it is impossible to determine the amount of food that is customarily consumed. FDA is well aware of the limitations of the available food consumption data bases. However, these data bases are still the best sources of food consumption data collected under actual conditions of use available to the agency. Thus, FDA concludes that its use of food consumption data as the primary source for the customarily consumed amounts of food for nutrition labeling purposes is appropriate.

FDA agrees with the comments that stated that sources other than food consumption data are sometimes appropriate. Thus, when food consumption data were inadequate, the agency used the other sources of information listed in § 101.12(a)(5) to determine the reference amounts.

As for the use of the "longstanding" serving sizes, in the notice for the 1991 public meeting (56 FR 8084), FDA requested comments and supporting data on the definition of a "longstanding" serving size. In response to this notice, the agency received only one comment that stated that "longstanding" serving size should include serving sizes used before 1973, as a minimum, and presented three examples of serving size used before that date. Since it had no established definition or sufficient data to define "longstanding" serving sizes, the agency took into consideration all serving sizes suggested in comments regardless of their history of use in determining the reference amounts proposed in the 1991 serving size proposal. In comments to the 1991 serving size proposal, the agency has not received any additional information or data on how to define a "longstanding" serving size. Therefore, it is unable to define "longstanding" serving sizes.

FDA does not agree with the industry comment that changing the currently used serving sizes would be confusing to consumers, and the agency has not received any data to support these arguments. On the contrary, consumer comments overwhelmingly attest to the fact that the current system that allows a proliferation of serving sizes has been very confusing. Congress also recognized this fact. The House Report specifically states: "The Committee believes that the current information

about serving size on many foods is extremely misleading" (H. Rept. 101–538, supra, 18). Establishing standard serving sizes will reduce this confusion and provide a consistent basis for serving sizes and for claims based on them. Moreover, some of the serving sizes currently in use (e.g., 2 servings on a 12-fl oz can of soft drink) are not consistent with the act because they do not reflect the amount customarily consumed.

With regard to the use of other dietary guidance materials and the claim that reference amounts should be based on what people should eat rather than what they usually eat, FDA acknowledges that it would be desirable to have serving sizes on product labels that are consistent with the serving sizes in the dietary guidance documents published by Federal agencies. However, FDA advises that the act defines serving size as an "amount customarily consumed," not an amount people should eat. The agency has made some modifications in reference amounts where the changes are consistent with the customarily consumed amounts of the products under consideration, such as those described for bread in section III.D.5. of this document. Although these changes have not deviated from the definition of serving size, they have resulted in serving sizes more in agreement with dietary guidance documents.

However, because dietary guidance documents were developed for purposes other than regulatory uses, these documents have several problems that prevent their use as the primary source in determining reference amounts. Of greatest significance is the fact that many serving sizes in the dietary guidance documents are not based on the amounts customarily consumed and, therefore, are not consistent with the definition of serving size in the act. Dietary guidance documents published by Government agencies usually list approximate amounts of food for the purpose of providing "general" guidance as to what quantity of each food group a person should consume to maintain good health. Therefore, the amount that represents a serving is often not well defined (e.g., 1 slice for bread when the weight of a slice of bread varies among different brands).

The documents also provide a measure that is not applicable for all products within a product category. For example, these documents recommend the serving size for vegetables, other than raw leafy vegetables, as 1/2 cup. Vegetables in small pieces (e.g., green peas, cut corn) can be measured with a cup. However, many other vegetables come in a form that cannot be measured with a cup (e.g., broccoli spears; although broccoli can be measured if it is cut in small pieces, the weight per cup would vary widely depending on the shape and size of the cut piece).

In addition, dietary guidance documents give one serving size for a broad food group. Customarily consumed amounts, however, vary for different types of food within the food group. Therefore, for nutrition labeling purposes, FDA cannot use one reference amount for the broad groups defined in these documents.

In summary, dietary guidance documents are written for purposes other than implementing the serving size requirements of the act, and thus the serving sizes in these documents do not provide the accuracy and specificity that are needed for the reference amounts that are used for nutrition labeling under section 403(q) of the act.

With regard to the comment that a food consumption data base such as the NFCS is inappropriate to determine long-term intake because the survey covered only a limited number of days, FDA notes that the comment has confused the procedures used to estimate the reference amounts with the procedures used to estimate the average daily intake of food. FDA advises that the number of days of data collection is not critical for the estimation of reference amounts, particularly if the survey included a large number of people as was done in the NFCS.

The number of days of data collection is an important issue when an estimate of the long-term intake (chronic intake) is needed, e.g., for the safety evaluation of a food or a component of food. A survey that contains a limited number of days of data may overestimate the chronic intake, by eaters, of a food that is consumed infrequently (e.g., a specific fish) but that was consumed during the survey. For example, estimates of the average daily intakes of swordfish derived from the NFCS are likely to overestimate the chronic intake of swordfish because this fish is not consumed frequently in the United States. If an uncommon food is consumed during the survey and the amount consumed is divided by the number of survey days, 3 in this example, the average daily intake estimate for long-term intake will be greatly exaggerated because even people who like swordfish are not likely to consume it once every 3 days.

However, in determining reference amounts, FDA used the amount consumed per eating occasion, which is a short-term not a long-term intake. Thus, it was not necessary to average the amount of food consumed by the number of survey days. For the determination of reference amounts, the amount of food consumed for each eating occasion reported was counted as a separate entry. Consequently, surveys that contain 3-day data for a large number of people, like the NFCS, are appropriate for use in determining the amount of food customarily consumed per eating occasion.

18. Several comments discussed the selection of the food consumption data base used in determining the reference amounts. Most of the comments objected to using the 1987–1988 NFCS either by itself or with the 1977–1978 NFCS. The comments were concerned that, because of the low response rate, the data from this survey may not represent the amount customarily consumed as directed by the act. Some comments stated that FDA should use only the 1977–1978 NFCS. Some comments opposed using the 1985 and 1986 Continuing Surveys of Food Intakes by Individuals (CSFII) because these data bases included only selected age/sex groups (women 19 through 50 and children 1 through 5 years of age). These comments asserted that the use of the CSFII data bases resulted in an underestimation of the amount customarily consumed because men and older children, who as a group usually consume larger quantities of food than women and younger children, were not included.

A comment from a consumer organization strongly objected to FDA's use of the 1987–1988 NFCS with validation by the CSFII if data from the 1987–1988 NFCS suggested a change in consumption practices since 1977–1978 NFCS. The comment asserted that the CSFII is an inappropriate data base for validating serving sizes because the CSFII included only women ages 19 through 50 and their young children ages 1 through 5. Therefore, the comment asserted, the data base did not reflect the food consumption practices of the entire population, and the validation cannot be used for the entire population. The comment also contended that in validating the trend change in consumption, FDA did not compare the data from the CSFII to what women and young children were eating in the 1977–1978 NFCS.

A manufacturer stated that FDA should solicit consumption data from manufacturers because "the industry may well be the most efficient, accessible and accurate source of information" because "an ongoing knowledge of current consumption data * * * is vital and basic to [the] production and marketing of a product."

Because the final results of the 1987–1988 NFCS were not available in time for the 1990 proposal, FDA relied primarily on the 1977–1978 NFCS to determine the "standard serving sizes." Numerous comments on the 1990 proposal opposed FDA's use of a data base that is more than 10 years old. The comments argued that the food consumption practices have changed since the 1977–1978 NFCS, and that, therefore, estimates derived from the 1977–1978 NFCS may not reflect current food consumption practices.

Since the publication of the 1990 proposal, USDA released the final data tape for the 1987–1988 NFCS. However, FDA could not use the 1987–1988 NFCS alone because this survey had an unusually low response rate. Therefore, FDA used both the 1977–1978 and the 1987–1988 survey data in developing the reference amounts in the 1991 serving size proposal. If the 1987–1988 NFCS had a higher response rate, the new survey data would have been preferable to the 1977–1978 NFCS data for determining the reference amounts of food because of its recency. The use solely of the 1977–1978 NFCS is also not desirable because the data are almost 15 years old, and many new products have been introduced into the marketplace for which the 1977–1978 NFCS had no data. Also, changes in the customarily consumed amounts that might have occurred since the 1977–1978 NFCS could not be determined from the use of that survey alone. Therefore, FDA tentatively concluded that using both survey data bases is the most desirable approach because such an approach compensates for limitations in each of the two surveys; increases the number of available data points; provides two sets of mean, median, and modal amount consumed rather than one; and therefore strengthens the reliability of the reference amounts determined. Comments that objected to the use of the 1987–1988 NFCS did not provide any solution on how to determine the current customarily consumed amount of food that reflect changes in the food consumption practices of the U.S. population since the 1977–1978 NFCS. In addition, the comments did not provide any suggestions on how to estimate the consumption of new products introduced into the marketplace since the 1977–1978 NFCS. Thus, in order to determine the customarily consumed amount of food that is representative of U.S. food consumption, that reflects current consumption practices, and that includes new products introduced into the marketplace since the 1977–1978 NFCS, the agency concludes that the use of both the 1977–1978 NFCS and the 1987–1988 NFCS is necessary to compensate for limitations in each of the two surveys.

The comments that objected to the use of the CSFII data bases because these data may have lowered the reference amounts, misunderstood the way FDA used these data bases in determining reference amounts. When the results of the 1987–1988 NFCS suggested a change in food consumption practices since the 1977–1978 NFCS (e.g., customarily consumed amounts increased or decreased substantially), FDA used the CSFII data bases, which had a high response rate, only to confirm the validity of the trends observed, i.e., to show that the apparent trends were not an artifact of the low response rate in the 1987–1988 NFCS. As mentioned in the 1991 serving size proposal (56 FR 60394 at 60403), such a validity check to confirm the trend observed in the 1987–1988 NFCS was recommended by an expert ad hoc committee that evaluated the impact of nonresponse in the 1987–1988 NFCS (Ref. 26). Only when the same trends were observed in the CSFII did FDA rely solely on the 1987–1988 NFCS, so that the reference amount would reflect the current consumption practices more accurately. The estimates of intakes derived from the CSFII were not used in arriving at the reference amounts proposed in the 1991 serving size proposal. Therefore, potentially lower estimates derived from the CSFII data bases had no effect on lowering reference amounts.

With regard to the objection to FDA's use of the 1987–1988 NFCS if it suggested a change in consumption since the 1977–1978 NFCS and the use of CSFII to validate that change, the agency recognizes that the CSFII included only limited age and sex groups. Although the CSFII data bases used to confirm the trends included only women 19 through 50 and children 1 through 5 years of age, these data bases were the only other recent data bases that: (1) Were produced in a study conducted about the same time period as the 1987–1988 NFCS using the same survey methodology, (2) reflected food consumption practices representative of the U.S. population groups that were studied under the actual conditions of use, and (3) had a high response rate. Therefore, the CSFII data bases were the only data bases available to the agency for the purpose of confirming the apparent trend observed in the 1987–1988 NFCS, and, as mentioned above, their use in this manner was recommended by an expert ad hoc committee that evaluated the impact of nonresponse in the 1987–1988 NFCS (Ref. 26).

As for the assertion that FDA should have compared the data from the CSFII to what women and young children were eating in the 1977–1978 NFCS, the agency has done data analysis for women and young children in the 1977–1978 NFCS for those product categories that relied on the 1987–1988 NFCS because of consumption changes since the 1977–1978 NFCS. The results showed that the same consumption changes were observed for women and young children as for the total population since the 1977–1978 NFCS (Ref. 40). Thus, FDA concludes that it used the 1987–1988 NFCS and the CSFII data appropriately, and that it made the best use of the available food consumption data bases.

With regard to the request that FDA solicit consumption data from manufacturers, in the preamble to the 1991 serving size proposal (56 FR 60394 at 60401), FDA requested such data by stating that "[T]he agency is willing to consider any data that may give a better estimate of an amount customarily consumed of a specific product category." Many comments submitted food consumption and other data in support of the requests for changes of the reference amounts. FDA has considered all data that were submitted. It will discuss and respond to these data in section III.D.5. of this document, which discusses requests for changes in reference amounts for specific product categories. However, while some of these data have led the agency to modify the specific reference amounts in Table 2 in new § 101.12(b), the fact that they have caused the agency to make only a relatively small number of changes supports the basic validity of FDA's reliance on the 1977–1978 and 1987–1988 NFCS data.

19. A few comments stated that reference amounts should be based solely on the modal amount consumed, which represents the most frequently consumed amount, not the mean or median amount consumed.

FDA received the same suggestions in the comments on the 1990 proposal. As explained in the 1991 serving size proposal (56 FR 60394 at 60400), the mode was not useful as the sole criterion for determining the reference amount because most food groups had two or more modes, and there usually was no obvious or rational basis to choose one over the other. Therefore, FDA used all three (or more, if there was more than one mode) values that could represent an amount customarily (commonly) consumed, i.e., the mean, the median, and the mode. Following

the procedures detailed in the 1991 serving size proposal (56 FR 60394 at 60404), FDA determined the reference amount that was most likely to represent the amount customarily consumed for each product category. The new comments offered no additional data or arguments to support that using only the modal value is better than using all three values suggestive of the amount customarily consumed and no suggestions for how to select one modal value over another when there were multiple modes that were similar in frequency. Thus, FDA concludes that it is appropriate to consider all three values that provide data on which to derive the customarily consumed amount (i.e., mean, median, and mode).

2. Expression of reference amounts

In the 1991 serving size proposal (56 FR 60394 at 60406), FDA described the general principles that it followed in expressing the reference amounts in proposed § 101.12(b). FDA expressed reference amounts for fluids in mL. It expressed reference amounts for other foods, to the extent possible, in g. For a limited number of product categories, FDA expressed the reference amounts in common household measures. For example, when foods within a product category varied considerably in density, and the customarily consumed amounts for different products were more uniform when expressed in volume than in weight, FDA expressed the reference amounts in cups, tbsp., and teaspoons (tsp.). In these limited cases, FDA selected volumes that could easily be expressed in fractions or multiples of common household measures as described in proposed § 101.9(b)(5). Several comments requested changes in some of these principles.

20. One manufacturer stated that all reference amounts should be expressed in g, and another suggested that reference amounts for specific product categories (e.g., soups, sauces, gravies, beans, and mixed dishes) should be in g instead of cups.

FDA agrees that when possible, reference amounts should be expressed in g. As discussed more fully in section III.D.5. of this document, some of the specific product categories originally expressed in volume-based reference amounts have been changed to weight-based reference amounts. However, the agency does not agree that it is appropriate or desirable to do so for all product categories, including some of those specifically mentioned in comments. As explained above, when products within a product category differ widely in density, the use of a fixed g reference amount would result in a serving size that is too large for some products in the category and too small for others, even though the volume amounts consumed are similar for all products within the category. For example, although the reference amount for "mixed dishes measurable with cup" is 1 cup, the g-weights of different types of products within the category differ widely, e.g., about 160 g for seafood with vegetables without sauce and about 250 g for seafood stew. Also, fluids (e.g., beverages) have been customarily expressed in volume (mL or fl oz) not in weight, and they can easily and accurately be measured in volumetric units. Thus, FDA has used weight-based reference amounts in most cases but has retained volume-based reference amounts for fluids and for a limited number of categories with products that vary greatly in density (e.g., mixed dishes measurable with a cup, product category having aerated products) or for which information on the g-weight of the household measure is scarce, and comments have provided no appropriate weight-based reference amounts that are accurate and nonmisleading for all products within the category (e.g., condiments).

21. A manufacturer stated that reference amounts should not be adjusted to reflect "nonmetric" household measures. The comment suggested that such adjustments would be confusing and of no assistance to the consumer. A consumer recommended expressing reference amounts in rounded metric units, e.g., 250 mL for juice (8.45 fl oz), not 240 mL (8 fl oz).

FDA disagrees with the comment. The act requires that serving sizes be declared in common household measures, and therefore, those measures must drive the reference amounts. The common household measures are the declaration that appears first on the nutrition label, followed in parentheses by the equivalent metric measure which may or may not be the same as the reference amount. Many consumers complained about odd fractions (e.g., 1.4, 2.3). Therefore, a fractional serving size such as 8.45 fl oz, which was suggested in the comment, is not desirable. Thus, it is important to adjust the reference amounts to be in metric amounts that convert to useful, whole number household measures rather than rounded metric units.

22. A manufacturer requested that FDA express the reference amounts in either U.S. measures or in metric equivalents that reflect the more precise factors of 28.35 g per oz instead of 28 g per oz and 29.57 mL per fl oz instead of 30 mL per fl oz.

FDA notes that the reference amounts are amounts customarily consumed that will guide manufacturers to determine the label serving sizes of their specific products in common household measures. The serving sizes in common household measures will be in units such as pieces, cups, tbsp., and tsp. These household measures are primarily for consumer use, and it is unlikely that they will measure a cup with the 4-digit accuracy suggested in the comment. Accordingly, the reference amount that will be used as a guide for determining the serving size in household measure does not need the 4-digit accuracy of the g and mL equivalency suggested in the comment. Also, both 28.35 g and 28 g will be translated to 1 oz for the label serving size when oz is used as the serving size. Both 29.57 mL and 30 mL will be translated to 1 fl oz for the label serving size. In addition, in the case of fl oz, the 30 mL equivalency of 1 fl oz allows for the exact conversion of 1 cup to 8 fl oz. Therefore, the agency has concluded that for nutrition labeling purposes, 28 g for 1 oz and 30 mL for 1 fl oz are sufficiently accurate and appropriate because they provide the accuracy needed for nutrition labeling purposes without implying unrealistic accuracy, and because whole numbers are easier to use than decimal fractions.

3. Presentation of reference amounts

23. In footnote 2 under Tables 1 and 2 in proposed § 101.12(b) in the 1991 serving size proposal (56 FR 60394 at 60418 and 60419), FDA stated that, unless otherwise noted in the reference amount column, the reference amounts in the tables are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve, brown and serve), and that if the reference amount is not listed separately, the reference amount for the unprepared form (e.g., dry mix, concentrate) of the product is the amount required to make one reference amount of the prepared form.

A trade association requested that FDA delete footnote 2 from Tables 1 and 2 because it "implies that most of the major reference amounts used to determine number of servings will be based on a cooked (consumed) basis." The comment further requested that if FDA did not mean that the number of servings should be based on the cooked basis, the agency should provide a complete explanation in the preamble of this document or in another official, readily accessible reference. The comment contended that it would be difficult to determine the number of servings for the unprepared form of the product.

FDA believes that the comment has misinterpreted the footnote. Many foods are available in the marketplace in several different forms: Ready-to-serve, almost ready-to-serve, dry mixes, batters, or concentrates. For example, pancakes come in three different forms: Dry mix, batter, and the frozen almost ready-to-serve form, which requires only heating before consumption. If FDA were to list reference amounts for all of the different forms of these foods, the tables would be needlessly lengthy. In addition, the list would not include forms of the food requiring further preparation that may be introduced in the future. Because the amounts of food consumed are similar for the ready-to-serve and the unprepared forms on an as consumed basis, as explained in the preamble of the 1991 serving size proposal (56 FR 60394 at 60407), FDA listed all forms of the same food together and provided one reference amount listed on an as consumed basis. Footnote 2 merely explains that the reference amounts in the table are expressed in the quantity of the food that is in the ready-to-eat or the almost ready-to-eat form of the food. Since nutrition labeling is required to be on an "as packaged" basis, the footnote further informs the manufacturer that, for the unprepared form of a product that requires further preparation before consumption (e.g., dry mix, batter, uncooked food), the manufacturer must determine the quantity of the unprepared product that is required to make one reference amount of the prepared product as specified in new § 101.12(b). Using the reference amount for the unprepared product, the manufacturer must then determine what the serving size of the unprepared product "as packaged" should be in common household measure.

For the pancake example, this requires that the manufacturer determine the weight of dry mix or batter required to make one reference amount (110 g) of the prepared pancake according to the label directions for the preparation. If 40 g of a pancake mix is needed to make 110 g of pancakes, 40 g of dry mix is the reference amount of this pancake mix. The serving size for this pancake mix will be about 1/3 cup (40 g). The number of servings per container will then be estimated from the net quantity of contents of the container and the reference amount for the unprepared form of the product. For the pancake example above, if the net quantity of the package is 12 oz, the number of servings per container can be determined by dividing the net quantity in g by the reference amount for the dry mix (40 g), e.g., (12 oz) x (28.35 g/oz)/ 40 g = 8.5, i.e., about 9 servings according to the provision for declaring the number of servings per container in new § 101.9(b)(8).

As requested in the comment, FDA has provided a complete explanation of the footnote and how to determine the number of servings per container for unprepared products that require further preparation. Therefore, the agency is retaining Footnote 2 for Tables 1 and 2 in the final regulation to inform manufacturers that the reference amounts in Tables 1 and 2 are the amount of the final product on a ready-to-serve or almost ready-to-serve basis. In addition, for clarity, the agency has added, at the end of footnote 2 to Tables 1 and 2, the following statement: "Prepared means prepared for consumption (e.g., cooked)."

24. A trade association suggested that FDA express the reference amounts in Tables 1 and 2 in proposed § 101.12(b), where possible, in common household measures with the equivalent metric quantity in parenthesis. The comment stated that consumers, FDA, and the food industry will be best served if the reference amounts in the regulation tables are stated as they should appear on the label.

FDA understands the concern expressed by the comment. However, different characteristics (e.g., shape, size, density) of different products preclude the presentation of most reference amounts as they would appear on the product label. For example, the reference amount for bread is 50 g. The serving sizes for most sliced bread will be 1 slice. However, the parenthetical metric measure will differ depending on the thickness of the slice. In addition, if a slice weighs 50 percent or less of the reference amount, the serving size will be the number of slices that most closely approximates the reference amount. Thus, both the household measure and the metric measure may vary for brands that come in different thicknesses as shown in the examples below.

BRAND A: 1 slice (35 g)
BRAND B: 1 slice (28 g)
BRAND C: 2 slices (45 g)

Therefore, for most products, FDA cannot express the reference amounts as they should appear on the label. However, in response to the comment, FDA is adding a label statement column to Tables 1 and 2 in new § 101.12(b). This column provides guidance on how the serving sizes of specific products in each product category will appear on the product labels and should help reduce confusion and promote uniformity in label serving size units. For example, the label statement for bread and rolls states "——— piece(s) (———g) for sliced bread and distinct pieces (e.g., rolls); 2 oz (56 g) for unsliced bread." For sliced bread or rolls, manufacturers will then fill in the number of slices or rolls that most closely approximates the 50 g reference amount and the g-weight equivalent of that number of slices or rolls. For unsliced bread, oz is the household measure most appropriate for the food and 2 oz most closely approximates the 50 g reference amount for bread. The metric measure equivalent to 2 oz is 56 g because 1 oz in weight is defined as 28 g for nutrition labeling purposes in § 101.9(b)(5)(iv). Therefore, the label statement for unsliced bread states "2 oz (56 g 1-inch slice)."

Where possible, FDA has also provided the exact household measure and the equivalent metric measure for serving sizes in volumetric measures other than oz (e.g., cups, tbsp.), using the g weight of the household measure reported by the USDA. For example, for the product category of "Confectioner's sugar," the reference amount is 30 g which is equivalent to 1/4 cup. Therefore, the label statement column states "1/4 cup (30 g)," which is how the information will appear on the product label.

25. An industry comment urged FDA not to include the reference amount table (proposed § 101.12(b)) in the regulation itself. Instead, the comment asked that FDA generally establish its intention to use such a table, then reference and formalize the table through policy memoranda. The comment stated that if the reference amount table is in the regulation, the petition process for modifying the reference amounts would require a notice and comment rulemaking which would necessitate publication in the Federal Register before a change could be made.

The reference amount table appropriately is included in the regulation because these amounts have the force and effect of law. While it is true that any changes in the reference amounts will require a notice and comment rulemaking, FDA concludes that giving the reference amounts legal effect is required to implement section 403(q)(1)(A)(i) of the act. The legislative history of section 2(b)(1)(B) of the 1990 amendments directs FDA to establish meaningful serving size *requirements* (H. Rept. 101–538, supra, 18). Such requirements are necessary to ensure that the serving size that appears on the label reflects the amount customarily consumed.

4. Product categories

a. Number of product categories

FDA proposed 131 product categories: 9 for foods specially formulated or processed for consumption by infants or toddlers and 122 for the general food supply. The agency asked for comments on whether these categories adequately cover the food supply (56 FR 60394, 60407).

Many comments addressed whether the 131 product categories are adequate. Some comments expressed their support for the 131 product categories proposed in the 1991 serving size proposal. These comments stated that the proposed product categories are reasonable and recognizable. Several comments suggested that some of the product categories should be combined. The vast majority of the comments, however, stated that the 131 categories were too restrictive and recommended expanding some of the categories.

Because the comments about the number of product categories are closely related to the comments on the reference amount, those comments that requested merging or expanding specific categories will be discussed in the next section of this document on requests for changes in reference amounts for specific product categories. This section includes only those comments that requested recategorization of entire product categories or addition of a product category.

26. A State government comment recommended that FDA regroup all products into six categories and establish one standard measure for each category that is easily understood and multipliable. For example, the comment suggested grouping dry cereal, rice, beans, raisins, nuts, bread, tortilla, crackers, cooked fish, and hard cheese into one category with a standard serving size of 1 oz.

Section 403(q)(1)(A)(i) of the act defines serving size as an amount of food customarily consumed. Therefore, FDA has not grouped products together unless their customarily consumed amounts are similar. Grouping of foods into such broad categories as those suggested by the comment is not possible because the amounts customarily consumed vary widely. For example, 1 oz may be an appropriate reference amount for some foods in the grouping suggested by the comment (e.g., cheese, some ready-to-eat cereals), but it is too small for other foods in that grouping (e.g., bread, fish). Food consumption data show that the amount customarily consumed for fish without sauce is 3 oz cooked, and that for fish with sauce (e.g., fish with cream sauce), it is 5 oz cooked.

27. A manufacturer requested that FDA add a product category for snack sandwiches, which have recently been introduced into the market, with a reference amount of 70 g.

The 1991 serving size proposal has a product category that includes products such as snack sandwiches. These sandwiches belong to the category of "mixed dishes not measurable with cup." The proposed reference amount for this category, that is retained in the final regulation, is 140 g. Because snack sandwiches are discrete unit products, the label serving size will be one sandwich if it weighs more than 70 g. If the sandwich weighs 70 g or less each, the serving size will be the number of sandwiches that most closely approximates the 140 g reference amount. However, the agency notes that, as discussed in section III.F.1. of this document, new § 101.9(b)(10)(ii) allows manufacturers to voluntarily provide a second column of values per unit on multiserving containers.

Regardless of the size of the individual unit, the 140 g reference amount will be used to evaluate the product's qualification for claims unless the sandwich meets the definition of a meal product or main dish product in new § 101.13(l) and (m). If the sandwich meets the definition of meal product or main dish product, the product's qualification for a claim will be evaluated by the rules described in the nutrient content claim regulation published elsewhere in this issue of the **Federal Register.**

28. A comment from a Federal agency stated that there should be a product category for gelatin salad.

In the 1991 serving size proposal, all gelatin products were included in the "Custards, gelatin, or pudding" category under Desserts. Because some gelatin products are served as salads rather than desserts, FDA agrees with the comment that it would be desirable to have a separate category for gelatin salads. Accordingly, a new category "Gelatin Salad" has been added to Table 2 in new § 101.12(b). Following the general principles and the procedures described in the 1991 serving size proposal (56 FR 60394 at 60402), FDA has determined the reference amount for the category to be 120 g, which is equivalent to 1/2 cup (Ref. 41).

29. A manufacturer of "herring salad" and smoked salmon spread stated that their products were not included in the 131 product categories proposed in the 1991 serving size proposal. The manufacturer stated that "herring salad" is a "fanciful name" and is not a fish salad. "Herring salad" and smoked salmon spread are ground pastes of herring or salmon and other ingredients such as celery, pickle relish, mayonnaise, and spices. They are neither used nor marketed for use as sandwich spreads like tuna salad. They are promoted for use as an appetizer to be spread on crackers, in the same manner consumers would use pickled herring. The manufacturer stated that "herring salad" and smoked salmon spread should be added to the 'Smoked or pickled fish or shellfish" category.

FDA agrees that the characteristics and the usage of "herring salad" and smoked salmon spread suggested in the comment most closely resemble those products used as appetizers in the "Smoked or pickled fish or shellfish" category. In addition, "herring salad" and smoked salmon are canned fish products. Both of these categories have a reference amount of 55 g. Therefore, it is a matter of choice in which category these products are placed. FDA has concluded that "herring salad" and smoked salmon are types of fish products used in the same manner of those products in the "Smoked or pickled fish or shellfish" category and thus, fit better in the "Smoked or pickled fish or shellfish" category than in the canned fish category. Therefore, FDA has modified the name for the "Smoked or pickled fish or shellfish" category in Table 2 in § 101.12(b) to include fish or shellfish spread.

30. A consumer comment stated that a category is needed for products such as tempeh. The comment suggested 1 oz as the reference amount for these products.

FDA acknowledges that tempeh should be included in § 101.12(b). However, the agency disagrees with the comment that it should have a separate category with a reference amount of 1 oz. The comment did not provide any data on the amount customarily consumed to support the recommendation of a 1 oz reference amount. Because tempeh is a type of soy product that is used interchangeably with tofu (Ref. 42), the agency concludes that tempeh belongs in the "Bean cake (tofu)" category with a reference amount of 85 g. Accordingly, FDA has revised the "Bean cake (tofu)" category to include tempeh.

In addition, the agency is aware that there are an increasing number of ethnic foods entering the general food supply. However, available food consumption data do not usually provide information on these ethnic foods. Therefore, FDA requests that manufacturers or other interested persons submit a petition as described in § 101.12(h), if any

additions or amendments to § 101.12(b) are necessary to encompass the ethnic foods sold to the general public.

31. The spice industry requested exemption from nutrition labeling on the basis that spices in general contain insignificant amounts of nutrients on a 1/4 tsp. basis. The comments requested that FDA establish 1/4 tsp. as the reference amount and "acknowledge that when used at that level, the industry is not covered by the mandatory nutrition labeling requirements of the proposals."

Exemptions from mandatory nutrition labeling are discussed in the final regulation entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" published elsewhere in this issue of the Federal Register. The agency agrees with the comment that there is a need for a reference amount for spices and herbs and, accordingly, has added a category for these products. Spices and herbs are used to flavor foods. Cookbooks (Refs. 43 and 44) usually recommend using 1 to 2 tsps. of these products in recipes that make several servings. Therefore, one serving of food contains only a fraction of a tsp. of spices or herbs (e.g., 1/4 tsp. or less). One-fourth tsp. is also the smallest household measure allowed to be declared as a serving size for nutrition labeling purposes. Therefore, FDA has concluded that 1/4 tsp. is the most reasonable reference amount for this product category. For spices and herbs that cannot be measured with a tsp. (e.g., whole clove, whole bayleaf), the agency has determined the reference amount of 0.5 g which represents the average g weight of 1/4 tsp. of spices and herbs. Consequently, FDA has added a new product category under the miscellaneous category for spices and herbs with a reference amount of 1/4 tsp. or 0.5 g if not measurable by a tsp.

32. An industry comment stated that it is confused about which products go into the breads category. Another industry comment requested clarification as to which category canned hot dog chili sauce belongs.

First, the agency notes that as discussed in section III.D.5. of this document, FDA has divided the "Bakery Products: Breads (excluding sweet quick type), biscuits, rolls, * * *" category (the original bread category) into two categories: One for breads and rolls, and the other for the remaining products included in this category in the 1991 serving size proposal. This was done in response to many requests for dividing the original bread category into several subcategories. The breads and rolls category in the final regulation includes all breads (e.g., white, wheat, rye, multigrain, raisin, and soda bread) and all rolls (e.g., dinner rolls, hamburger rolls, hot dog rolls).

With regard to the hot dog chili sauce, FDA advises that it belongs to the "Major condiments, e.g., catsup * * *" category under "Sauces, Dips, Gravies and Condiments" because it is used as a substitute for catsup on hot dogs.

To help manufacturers and others to identify the category in which their specific products fit, in the 1991 serving size proposal, FDA provided an extensive list of products for each product category (Ref. 20). The agency has updated this list to incorporate changes made in product categories and in the products included in each product category in response to the comments on the 1991 serving size proposal (Ref. 45). FDA will continue to update the list as necessary. Copies of the list are available from the Division of Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204. FDA advises that those who are not sure about which product category their specific products belong should refer to this list or consult with the agency.

33. A manufacturer contended that "not having a provision for new or undefined food products is of concern" to those developing new products.

FDA agrees that new products should be provided for in this regulation. It was for this reason that FDA proposed to establish a petition process in § 101.12(h) by which a reference amount could be amended or added. New § 101.12(h) describes the information needed in the petition in order for FDA to evaluate the request for a change or addition of a product category or a reference amount of a food in Tables 1 and 2, as well as the information needed to determine a suitable reference amount for the petitioned food, if the agency concludes that the change or addition is appropriate.

From the comments on the 1991 serving size proposal and through its own observation of products in the marketplace, the agency has identified three additional product classes (dessert shells, pastry shells, and dehydrated vegetables) that were not covered in the 1991 serving size proposal. The agency intends to publish a proposal for reference amounts for these product classes in the near future.

b. Product category names

Because each product category encompasses many different types and brands of products, it is impossible to fully describe all products within each product category. Therefore, in the 1990 proposal, FDA provided a generic description of each product category. A generic description is also desirable to accommodate the brands and types of products that may be introduced in the future. Some comments on the 1990 proposal stated that because some product categories were not sufficiently descriptive, they experienced difficulty in identifying the product category in which their products fit. Thus, in the 1991 serving size proposal, FDA modified the names of some product categories to be more descriptive and also provided a few recognizable examples where it felt that it was necessary to do so. In addition, the agency provided a separate extensive list of products for each product category (Ref. 20). Several comments on the 1991 serving size proposal again requested clarifications or changes in product category names as described below.

34. An industry comment requested that FDA add "crumbcakes and similar products" to the "Coffee cakes * * *" category under Bakery Products.

FDA advises that because crumbcakes are similar to coffee cakes in their nutrient content and use in the diet, coffee cakes and crumbcakes are included in the same food code in the NFCS. Consequently, crumbcakes were included in the coffee cake group in determining the customarily consumed amount of coffee cakes. Therefore, the agency agrees with the comment that it is appropriate to include crumbcakes in the name of the coffee cake category. However, the agency finds that it would not be appropriate or desirable to add a term such as "similar products" to the product category name because such a term could be interpreted differently by different companies and may result in an inappropriate classification of a product. For example, because apple crisp has a crumb topping, like crumbcakes, it could be misclassified as belonging to the "Coffee cakes * * *" category. However, apple crisp belongs in the "Pies, cobblers * * *" category, not the "Coffee cakes * * *" category because apple crisp resembles products in the "Pies, cobblers * * *" category in nutrient content and in use in the diet as indicated by being listed in the same food group as cobblers in the NFCS. Therefore, FDA has modified the name for the "Coffee cakes * * *" category to read: "Coffee cakes, crumbcakes * * *" For clarity, FDA has also modified the name for the "Pies, cobblers * * *" category to read: "Pies, cobblers, fruit crisp * * *"

35. Another comment pointed out that game meats are missing from FDA's product category list.

Game meats belong to the major product category of "Fish, Shellfish, and Meat or Poultry Substitutes," because this category includes all meat or poultry substitutes and is the product category comparable to the meat and poultry categories in the USDA regulation. Because meat and poultry substitutes replace meat and poultry in the diet, FDA used the amount customarily consumed for meat and poultry as a surrogate for the amount customarily consumed for meat and poultry substitute products. Therefore, because game meat is a type of meat and is used interchangeably with other meat, fish, or poultry in the diet, similar to those products in the "Fish, Shellfish, and Meat or Poultry Substitutes" category, FDA has included game meat in that category. Accordingly, FDA has modified the name of this major product category, and the names of its two subcategories, to include game meats as shown below:

"Fish, Shellfish, Game Meats, and Meat or Poultry Substitutes:"

"Fish, shellfish, and game meat, canned"

"Smoked or pickled fish, shellfish, or game meat; or fish or shellfish spread"

36. A nut industry comment stated that it is not clear in which category sliced nuts fit, "Nuts, seeds, and mixtures;" or "Nuts and Seeds: Used primarily as ingredients, e.g., coconut, nut, and seed flour, etc."

The agency advises that sliced nuts belong in the "Nuts, seeds, and mixtures" category because they were included in the analysis for the amount customarily consumed for the "Nuts, seeds, and mixtures" category. For clarity, FDA has modified the name for the "Nuts, seeds, and mixtures" category to "Nuts, seeds and mixtures, all types, sliced, chopped, slivered, and whole."

37. A manufacturer requested that FDA not use "popsicle" as part of the product category name because it is a trademark owned by a particular company.

FDA has deleted "popsicle" from the product category name. The new name for the product category is "Frozen flavored and sweetened ice and pops, frozen fruit juices: all types, bulk and novelties (e.g., bars, cups)." As discussed in section III.D.5. of this document, this category has been moved from the category for Sugars and Sweets and placed under the category for Desserts.

38. A pickle trade association stated that the product category name for relish ("Pickles, relish") suggests that the category excludes relishes that contain nonpickle ingredients. The comment argued that the category should include all relishes and requested that FDA change the category name from "Pickles, relish" to "Pickle relishes."

FDA agrees with the comment that "Pickle relishes" is a more appropriate name for the category that includes all vegetable relishes, including relishes containing nonpickle ingredients. The agency notes, however, that fruit relishes (e.g., cranberry relish) are a different type of product and are listed under "Fruits and Fruit Juice" with the reference amount of 70 g.

In addition, for clarity or for a better categorization of products, FDA on its own initiative has modified the names of the following product categories:

(1) Hushpuppies and cornbread have been deleted from the "Coffee cakes * * *" category under Bakery Products and placed in the "Biscuits * * *" category under Bakery Products.

(2) To prevent a misclassification of tortillas as taco shells because they are often used as a wrapper for tacos, the name for the taco shell category has been modified to read: "Taco shells, hard."

(3) To incorporate "frozen flavored and sweetened ice" and to reflect better the products included in the category, the name for the "Ice cream, ice milk, frozen yogurt, sherbet: All types, bulk and novelties * * *" category under Desserts has been changed to "Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: All types, bulk and novelties * * *"

(4) To reduce the number of product categories, FDA has deleted water as a separate category. For a better categorization of products, fruit-flavored drinks have been deleted from the "Juices, nectars, fruit drinks, or fruit-flavored drinks" category under Fruits and Fruit Juices. Water and fruit-flavored drinks have been combined with the category for "Carbonated beverages * * *" under Beverages. The revised name for the "Carbonated beverages * * *" category is "Carbonated and noncarbonated beverages, wine coolers, water."

These changes are intended only to clarify Table 2 and to make it more usable. They do not result in any substantive changes in the reference amounts of the products affected.

As mentioned in the previous section, to help manufacturers identify the product category in which their specific products fit, FDA has updated the list of products for each product category (Ref. 45). The agency will keep updating this list as new products are identified. Copies of the list are available from the Division of Nutrition (HFF–260), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

5. Reference amounts for specific product categories

FDA proposed, in § 101.12(b), the reference amounts for 131 product categories that it developed through the use of the general principles and procedures described in the 1991 serving size proposal. These reference amounts were presented in two tables. Table 1 contained the reference amounts for the 9 product categories that are specially formulated or processed for consumption by infants or toddlers. Table 2 contained the reference amounts for the 122 product categories in the general food supply.

FDA received more comments on the proposed reference amounts for specific product categories than on any other serving size issue. Many comments supported the proposed reference amounts. However, the majority of the comments that discussed specific reference amounts opposed one or more specific proposed reference amounts. The agency received requests for changes of the reference amounts for about 80 specific product categories. About half of the requests merely voiced their opinion on the proposed reference amounts for certain product categories (e.g., too large or too small) or provided generic types of bases for wanting the changes. The other half of the requests presented more specific reasons for each product or product category or presented data supporting their requests. FDA will first respond to the requests that provided generic types of bases and then will respond to the requests that provided more specific bases by product category.

a. Generic requests

Because many comments provided similar bases for wanting changes in the reference amounts, responding separately to them would be repetitive and would make the document needlessly lengthy. Therefore, FDA has grouped these bases and is responding to each type of basis for a change.

39. Many comments merely stated that they believed that the proposed reference amounts for specific product categories were too large or too small, but they did not present any specific arguments or data supporting their beliefs.

Section 403(q)(1)(A)(i) of the act defines serving size as "an amount customarily consumed." To determine this amount of food, FDA performed extensive analyses and evaluations of

data from four large national food consumption survey data bases, namely the 1977–1978 NFCS, 1985 CSFII, 1986 CSFII, and the 1987–1988 NFCS conducted by the USDA (56 FR 60394 at 60403). To respond to the recommendations in the IOM report and to comments requesting the use of other relevant information in addition to food consumption data, and to promote international harmonization, in addition to the food consumption data, FDA used several other sources of information listed in the proposed § 101.12(a)(5) in developing the proposed reference amounts. The agency carefully considered the food consumption data and the other information to determine the reference amounts proposed in the 1991 serving size proposal. Food consumption data and the other information used, along with the detailed description of the procedure and the basis used to determine the proposed reference amounts, were made available to the public (Ref. 2).

The law establishes an objective standard against which serving sizes are to be established. FDA cannot change the proposed reference amounts that were determined after careful and extensive consideration of food consumption data and other relevant information simply because some comments stated that the reference amounts are too large or too small without providing any data to support their assertions. Accordingly, FDA has not adopted recommendations based merely on belief or opinion.

40. A consumer organization and a few fast food companies recommended that FDA change some reference amounts to make them consistent with the average serving sizes of restaurant foods.

First, FDA advises that in determining the customarily consumed amount for each product category, it used both foods consumed at home and away from home (e.g., restaurant foods). Therefore, the serving sizes of restaurant foods were reflected in the reference amounts determined for each product category. In addition, the act mandates the nutrition labeling of retail products, not restaurant foods. Accordingly, new § 101.9(j)(2) exempts restaurant foods from the nutrition labeling regulation unless a claim is made. Therefore, it is more important for the reference amounts to be appropriate and applicable to retail products than to restaurant foods. Reference amounts that are solely based on the serving sizes of restaurant foods may not be appropriate for retail products. Furthermore, most restaurant foods are single-serving products. Based on the reference amounts in new § 101.12(b) and the definition for single-serving products, the serving sizes for restaurant foods will be one unit. Therefore, FDA has not changed the reference amounts to make them consistent with the average serving sizes of restaurant foods.

41. A manufacturer requested that FDA establish two different reference amounts, one for retail products and one for food-service products, for some product categories (e.g., 1 cup for retail soups and 3/4 cup for food service soups). The comment argued that the proposed reference amounts represent the amount customarily consumed in the home. The serving sizes used for food service products are smaller. Because these products are sold in some retail "club" stores, they will be required to bear nutrition labeling. The comment contended that if these products are required to use the same serving size as for the regular retail products, it would cause problems in providing preparation instructions and yield information directed to the food service operator because the serving size recommended for food service would differ from the serving size shown on the nutrition panel. The comment claimed that such labeling would be very confusing to the food service buyers and operators. The comment requested that food service products be allowed to use serving sizes that correspond to their traditional label instructions as long as the simplified-format of nutrition information is provided per serving based on the reference amount.

The same food cannot have different reference amounts (or label serving sizes) simply because it is intended to be sold or served for different purposes. Reference amounts of the same food sold at retail stores must be the same to facilitate nutrition comparisons of different brands regardless of where they are purchased. The reference amount for the food service products that are sold at retail stores must be based on the same reference amount as for the regular retail products.

42. Some comments recommended using a range of values rather than a fixed reference amount.

The reference amounts in § 101.12(b) will serve two purposes: (1) They will be used by manufacturers to determine serving sizes for their specific products, and (2) they will be used to determine whether food products meet the definitions for nutrient content and health claims. As explained in the 1991 serving size proposal (56 FR 60394 at 60414), both of these purposes require specific reference amounts, not a range of values. None of the comments provided any evidence that a range of values would be better than a fixed value to meet the two objectives of the reference amounts. Therefore, FDA has not adopted the recommendations for using a range of values.

43. A comment from a foreign government recommended changing the reference amounts because they differ from the amounts in its own guidelines or differ from the food consumption data developed in its country.

Although the act did not explicitly define the serving size as an amount customarily consumed by the U.S. population, it is implicit that the food consumption data used to determine this amount of food should be based on the food consumption practices by the U.S. population, not food consumption data from surveys conducted in other countries. The nutrition information on products sold in the United States is for the U.S. consumer. Moreover, the legislative history of the 1990 amendment talks about helping Americans to maintain a balanced and healthful diet and to follow the Surgeon General's guidelines (H. Rept. 101–538, supra 9–10). Moreover, one of the main sponsors of the legislation said in thanking the other main sponsor in the House that: "He has insisted that the bill be as effective as possible so that all Americans can be fully and fairly informed about the nutritional characteristics of the food that they eat" (136 Congressional Record H5841 (July 30, 1990)). Therefore, the reference amounts should be appropriate to U.S. consumers. FDA cannot change the reference amounts that reflect the food consumption practices of the U.S. population to make them consistent with the guidelines that are targeted for non-U.S. population groups or to make them agree with the data from food consumption surveys conducted in foreign countries. Accordingly, FDA has not adopted these recommendations.

b. Specific requests

In addition, FDA received many comments requesting changes in specific reference amounts. Some comments addressed meat and poultry products which are regulated by USDA. Unless such comments contained specific issues that were directed to FDA or that significantly bear on the labeling of products regulated by FDA (e.g., how to determine reference amounts for the unprepared form of the product), FDA is not responding to those comments pertaining to meat and poultry. FDA has forwarded these comments to USDA for consideration. Comments about game meats are included in this document.

Although the names and the order of the product categories in the final regulation have been changed somewhat, for the purpose of discussing the comments on specific reference amounts, the names and the order of the product categories presented in the 1991 serving size proposal are used below for ease of identifying the product category to which the comments were directed.

(1) Infant and toddler foods: other cereal and grain products, dry ready-to-eat, e.g., ready-to-eat cereals, cookies, teething biscuits, and toasts

FDA proposed 7 g as the reference amount for this product category.

44. A manufacturer of infant and toddler foods stated that 7 g is appropriate for infants but not for toddlers. Based on the published value for the median amount of ready-to-eat breakfast cereals consumed by toddlers 1 and 2 years of age as reported in the 1977–1978 NFCS, the manufacturer recommended 21 g, or 3/4 oz, as the reference amount for ready-to-eat cereals for toddlers.

FDA derived the proposed 7 g reference amount from the amount consumed by infants. Some of the products in this product category (e.g., teething biscuits, teething cookies) are primarily consumed by infants. However, FDA acknowledges that other products in the product category (e.g., cereals) may be consumed by both infants and toddlers. Therefore, the agency agrees that it is appropriate to have a separate reference amount for toddlers. However, the agency could not adopt the reference amount suggested in the comment because it was based solely on the 1977–1978 NFCS and included only toddlers 1 and 2 years of age. As discussed in section III.D.1. of this document, FDA is not using a reference amount that is solely based on the 1977–1978 NFCS. Also, new § 101.9(b)(1) defines toddlers as children 1 through 3 years of age. Therefore, the reference amount for toddlers should reflect the amount customarily consumed by toddlers 1 through 3 years of age. Following the procedures for determining the reference amount described in the 1991 serving size proposal (56 FR 60394 at 60403), FDA has determined the reference amount of cereals for toddlers 1 through 3 years of age to be 20 g (Ref. 41).

(2) Dinner, fruit, vegetable, stew or soup for toddlers, ready-to-serve

FDA proposed 170 g as the reference amount for this product category.

45. A manufacturer of infant and toddler foods stated that 170 g is too large for fruits and vegetables specially formulated or processed for consumption by toddlers. The comment recommended a separate reference amount of 100 g or 3 to 4 oz for fruits and vegetables based on the published data for the amount of fruits and vegetables consumed by toddlers 1 and 2 years of age as reported in the 1977–1978 NFCS.

FDA agrees with the comment that a separate reference amount is needed for fruits and vegetables. Detailed information on the characteristics of fruits and vegetables specially formulated or processed for consumption by toddlers was not available to FDA during the formulation of the 1991 serving size proposal. The information provided in the comment showed that fruits and vegetables specially processed for consumption by toddlers differ from fruits and vegetables specially formulated or processed for consumption by infants. Toddlers' products more closely resemble the canned fruits and vegetables in the general food supply than do fruits and vegetables for infants. The toddler products differ from the products in the general food supply primarily in the piece size, which makes them easier for toddlers to pick up with their fingers. Therefore, the agency believes that it is appropriate to use the amount of fruits and vegetables consumed by toddlers reported in the NFCS to derive the reference amount for the fruits and vegetables specially processed for consumption by toddlers.

Consistent with the discussion in section III.D.1. of this document, FDA is not using a reference amount that was suggested in the comment because it was solely based on the 1977–1978 NFCS and included only toddlers 1 and 2 years of age. Following the procedures for determining the reference amount that it described in the 1991 serving size proposal (56 FR 60394 at 60403), FDA has determined the reference amount for ready-to-eat fruits and vegetables specially formulated or processed for consumption by toddlers 1 through 3 years of age to be 125 g and 70 g, respectively (Ref. 41). Therefore, FDA has added 2 categories, "Fruits for toddlers, ready-to-serve" with a reference amount of 125 g and "Vegetables for toddlers, ready-to-serve" with a reference amount of 70 g.

(3) Infant and toddlers foods: egg/egg yolk, ready-to-serve

FDA proposed 55 g as the reference amount for this product category.

46. One comment recommended that FDA change the reference amount to 50 g because 50 g corresponds more closely to one-half of the net contents of a jar.

As discussed in the 1991 serving size proposal (56 FR 60394 at 60401), the act requires that the serving size be the amount customarily consumed. Therefore, jar size cannot be used as the basis for determining reference amounts. Furthermore, there is nothing that ties jar size to the amount customarily consumed. One may change, while the other does not. Therefore, FDA has not adopted this recommendation.

(4) Infant and toddler foods: juice, all varieties

FDA proposed 120 mL as the reference amount for juices specially formulated or processed for consumption by infants.

47. A consumer recommended that FDA change the reference amount to 125 mL because 125 mL is a rational metric size.

For the reason explained in section III.D.1. of this document, concerning the presentation of reference amounts in rational metric size, FDA has not adopted this recommendation. Accordingly, FDA has retained the reference amount as proposed.

(5) Bakery products: breads (excluding sweet quick type), biscuits, rolls, croissants, bagels, tortillas, soft bread sticks, soft pretzels (hereinafter referred to as "the original bread category" for simplicity).

FDA proposed 55 g as the reference amount for this product category.

48. Many industry comments requested that FDA divide this category into several subcategories with separate reference amounts for each subcategory. Two bakery trade associations recommended dividing the category into 4 subcategories with the following reference amounts: 45 g for bread, 50 g for rolls, 60 g for biscuits and English muffins, and 70 g for tortillas. The comments submitted published data from the 1977–1978 NFCS to support their position. In addition to these four subcategories, another industry comment suggested separate reference amounts for sliced and unsliced bread (e.g., 45 g for sliced bread and 55 g for unsliced bread). Several additional comments recommended a 45 g reference amount for bread but did not specify what the reference amount should be for other products in the bread category. The major reason stated by the industry in comments was to have a separate, lower reference amount for sliced bread so that the label serving size for sliced bread will be 1 slice, which is consistent with the serving size

in the dietary guidance documents published by Federal agencies. A nutrition professional organization also stated that the 2-slice serving size conflicts with the serving sizes in dietary guidance documents. This comment contended that consumers who hear that dietary guidance documents recommend 6 to 11 servings daily from the bread/cereal group, and then see that a label serving size is 2 slices, may be confused and think that the recommendation means 12 to 22 slices of bread a day. A few other comments suggested a 25 to 30 g reference amount for bread which is equivalent to the g weight of 1 slice of most breads. An international comment suggested changing the reference amount for bread to 45 g but keeping the 55 g reference amount for rolls because rolls are heavier than breads. One comment stated that the amount of bread customarily consumed was overestimated because FDA did not include the bread that was consumed as toast. The comment asserted that many people consume only one piece of bread as toast, and thus the amount customarily consumed would have been lower if FDA had included the bread consumed as toast in the data analysis.

FDA agrees that the 55 g reference amount could result in 2-slice serving sizes for some brands of sliced bread, and that it would be desirable to have serving sizes of sliced bread consistent with that in the dietary guidance documents published by Federal agencies. However, the agency does not agree that it should divide the original bread category into four subcategories with their own individual reference amounts. The data submitted in support of the four subcategories came from a USDA publication from the 1977–1978 NFCS (Ref. 46). These data are inappropriate for use in determining the reference amounts for several reasons.

First, the data represent the mean consumed amount per eating occasion by the total population including infants and children less than 4 years of age. New § 101.9(b)(1) defines the term "serving" or "serving size" for the general food supply as an amount of food customarily consumed by persons 4 years of age or older. Therefore, the reference amounts for the general food supply should reflect the customarily consumed amounts by individuals 4 years of age or older, not by the total population which includes infants and children less than 4 years of age.

Secondly, as discussed in the 1991 serving size proposal (56 FR 60394 at 60400), the mean is often influenced by "outliers" (i.e., extremely small or extremely large amounts). Therefore, the mean alone is not sufficient to determine the customarily consumed amount. As explained above, FDA has concluded that to determine a reliable estimate of the amount customarily consumed, all three statistical estimates that represent an amount customarily consumed (the mean, the median, and the mode) must be considered.

Thirdly, the data submitted in the comments represent estimates from the 1977–1978 NFCS. The sole use of the 1977–1978 NFCS is not appropriate for the reason stated in section III.D.1. of this document.

FDA, therefore, has reanalyzed the 1977–1978 NFCS and the 1987–1988 NFCS to determine the mean, median, and modal consumed amounts of bread per eating occasion including the bread that was eaten as toast for persons 4 years of age or older. The amounts consumed as toast were adjusted to account for the moisture loss during toasting in order to more closely determine the weight of the bread, i.e., the form sold.

The reanalysis of the food consumption data showed that both the 1977–1978 NFCS and the 1987–1988 NFCS showed somewhat lower customarily consumed amounts for breads and rolls than for other products included in the original bread category (Ref. 47). Therefore, the agency concludes that it is appropriate to divide the original bread category into two categories, one for breads and rolls and one for all other products (e.g., bagel, English muffins, tortillas). Based on the results of the reanalysis, FDA finds that 50 g is the amount customarily consumed of breads and rolls, and 55 g is the amount customarily consumed for all other products. Accordingly, FDA has divided the bread category into 2 categories with separate reference amounts.

FDA notes that the new 50 g reference amount together with the new lower limit for a single-serving unit (more than 50 percent of the reference amount) in § 101.9(b)(2)(i) would make 1 slice as the serving size for most sliced breads on the market. The agency also notes that it has added a provision in new § 101.9(b)(10)(ii) that allows voluntary labeling of a second column of values per unit (per slice in the case of sliced bread) if the serving size of a product in discrete units is more than one unit. Both of these changes should help alleviate any potential for consumer confusion, as discussed in the comments.

As for the other comments, FDA does not agree with having separate reference amounts for sliced and unsliced bread. The same food cannot have different reference amounts simply because it comes in different forms or shapes. The act directs the agency to establish uniform serving size. Therefore, the same food should have the same reference amount regardless of its form or shape. The agency also disagrees with the comments that recommended reference amounts based on the weight of 1 slice of bread because food consumption data did not support such reference amounts. The agency also does not agree with the international comment that suggested keeping the 55 g reference amount for rolls because rolls are heavier than bread. The agency notes that the act defines the serving size as an amount customarily consumed. Food consumption data of the U.S. population showed that the amount customarily consumed is not higher for rolls than for bread (Ref. 47). Therefore, FDA has not adopted these recommendations.

49. A manufacturer of "lite bread" suggested a separate category for "lite" breads with a reference amount of 40 g. The comment stated that if "lite" breads are grouped with regular breads, the serving size for "lite" breads will be 3 slices, not 2 slices.

FDA advises that § 101.12(e) of the 1991 serving size proposal, which has been combined with new § 101.12(d) (see section III.D.6. of this document), requires that the reference amount for an altered version of a food be the same as for the food for which it is offered as a substitute. Therefore, it is inappropriate to have a lower reference amount for "lite" breads. However, if the product has been modified to be an aerated product as described in new § 101.12(e), manufacturers may determine the density-adjusted reference amount for the "aerated" bread by adjusting for the difference in density of the "aerated" bread relative to the density of the appropriate reference bread. (See section III.D.6. of this document for further discussion).

50. Comments from the tortilla industry unanimously requested a separate category for tortillas because: (1) Tortillas are not used interchangeably with other products in the bread category; (2) the tortilla industry continues to grow and deserves a separate category; and (3) a separate category would "help focus guidelines more specific to tortillas rather than baked goods in general." The comments did not suggest what the reference amount for this separate category should be. A comment from a foreign government contended that tortillas should be included in the "Taco shell" category.

FDA does not agree with the comments. To minimize the number of product categories, FDA proposed to include tortillas in the bread category because the amounts customarily consumed of tortillas and other products in the bread category (e.g., bagel, English muffin) are similar. The comments did not provide data to the contrary. FDA recognizes that tortillas have uses somewhat different from other products in the bread category, and that the tortilla industry is growing. However, balancing the interest in minimizing product categories against the significance of these facts, FDA concludes that it is appropriate to list tortillas with other bakery products that have the same reference amount. Therefore, FDA is not creating a separate category for tortillas.

Also, tortillas cannot be grouped with taco shells because the reference amounts for the two foods differ by two-fold. Although they both are foods that originated in Mexico, tortillas are much higher in moisture content and thus are much heavier than hard taco shells. This difference in the moisture content is reflected in the g weight of the reference amount.

(6) Bakery products: breakfast bars and toaster pastries

FDA proposed 55 g as the reference amount for this product category.

51. Manufacturers of breakfast bars and toaster pastries commented that it is more appropriate to separate these products into two categories with separate reference amounts because they are not consumed in similar amounts or in similar manners. The comments submitted market research data that showed that less than 20 percent of the bars are actually consumed at breakfast, and almost 80 percent are consumed at lunch or as a snack. In contrast, approximately 80 percent of the toaster pastries are eaten at breakfast. The comments suggested 40 g or 41 g as the reference amount for grain-based bars including breakfast bars and granola bars. Another comment suggested a 35 g reference amount for granola bars. The comments agreed on the 55 g reference amount proposed for toaster pastries, but they contended that these products are used interchangeably with the products in the coffee cake category. The comments said that, therefore, they should be included in the coffee cake category.

FDA agrees that grain-based bars should have a separate category with their own reference amount. The agency finds that 40 g is appropriate because it is consistent with the amount of these bars customarily consumed (Ref. 2).

FDA also agrees with including toaster pastries in the Coffee cake category with a reference amount of 55 g. The comments support that doing so reflects how these products are customarily consumed. Therefore, in Table 2 of new § 101.12(b), FDA has deleted the category for breakfast bars and toaster pastries and has added a new category for "Grain-based bars with or without filling or coating, e.g., breakfast bars, granola bars, rice cereal bars" with a reference amount of 40 g, after the category for French toast and pancakes under the major category for Bakery Products. The agency has also revised the name of the coffee cake category to include toaster pastries.

(7) Bakery products: brownies

FDA proposed 40 g as the reference amount for this product category.

52. Two industry comments agreed with the 40 g reference amount. One comment, however, contended that brownies should have the same reference amount as cake because brownies do not differ from cake nutritionally, technologically, or in ingredients. Another comment asserted that an 80 g reference amount for brownies is consistent with consumption data and industry practice. Another comment recommended that FDA change the reference amount for brownies to make it uniform with the reference amount for snacks.

FDA disagrees with all of the comments that requested a change in the reference amount for brownies. Products that are similar nutritionally, technologically, and in ingredients often differ in amounts customarily consumed because they differ in other characteristics that affect the amount consumed (e.g., density). For example, the customarily consumed amount of dense ready-to-eat breakfast cereals (e.g., sweetened granola cereals) is about twice that of light weight cereals (e.g., flake-type cereals). Therefore, foods do not have the same reference amount simply because they are similar nutritionally, technologically, and in ingredients. They have the same reference amount if consumption data show that they do.

Data from the 1977–1978 NFCS and the 1987–1988 NFCS showed that 40 g, not 80 g, is consistent with consumption data for brownies (Ref. 2). FDA cannot change a reference amount simply to make it consistent with industry practice. The reference amount must reflect the amount customarily consumed. Also, the agency is not adopting the recommendation for a uniform reference amount for brownies and snacks because these foods are not necessarily used interchangeably, and such a uniform reference amount is not supported by food consumption data (Ref. 2). Accordingly, FDA has retained the reference amount as proposed.

(8) Bakery products: cake

FDA proposed 4 categories with separate reference amounts based on the density of the cakes: Heavy weight, medium weight, light weight, and very light weight. The heavy weight category included cakes weighing more than or equal to 10 g per cubic inch (e.g., cheese cake, fruit cake, and pineapple-upside down cake). The medium weight category included all cakes weighing more than or equal to 6 g but less than 10 g per cubic inch (e.g., most cakes with icing or filling, carrot cake, pound cake). The light weight category included all cakes weighing more than or equal to 4 g but less than 6 g per cubic inch (e.g., most cakes without icing or filling, very light cakes with icing or filling, eclairs). The very light weight category included all cakes weighing less than 4 g per cubic inch (e.g., angel food, chiffon, or sponge cake without icing or filling).

53. All comments that addressed the reference amounts for cakes opposed the density-based categories. The comments recommended eliminating the density specifications from the product category because: (1) Density has never been used by industry, the Government, or the trade to classify cakes; (2) it is difficult to determine the density because it varies with shelf life, temperature, and atmospheric pressure; (3) the density of a commercially prepared cake and the same cake baked from a mix may be slightly different and may result in the same type of cake falling into two different categories; and (4) there is potential for the manipulation of the densities of cakes that fall near category boundaries to fit in a favorable category.

Most comments recommended that FDA regroup cakes into 3 categories based on cake types: Heavy weight, medium weight, and light weight. The comments essentially requested retaining the proposed heavy and the very light weight categories with some modifications and combining the two proposed middle categories with a reference amount of 80 g. The comments also suggested including only those fruit cakes that contain 35 percent or more of the finished weight as fruit or nuts, as opposed to all fruit cakes, in the heavy weight category. The combined medium weight category would contain all chemically leavened cakes with or without icing or filling and other cakes (e.g., Boston cream pie, eclair) that do

not belong to the heavy or light weight category. A comment submitted a detailed description and results of analysis of data from the 1987–1988 NFCS in support of the 80 g reference amount recommended for the medium weight category.

FDA recognizes that it is difficult to determine the density of cake because it varies with shelf life, temperature, and atmospheric pressure. The agency also recognizes that other problems may arise from using the density-based categories such as that the density of a commercially prepared cake and the same cake baked from a mix may have slightly different densities that could result in the same type of cake falling into two different categories, and that the product categories based on density may encourage the manipulation of the density of cakes that fall around the borderline of a category to fit in a favorable category. The agency thus agrees with the comments that it is better to group cakes by type and to combine the proposed two middle categories into one medium weight category. The agency has reanalyzed the NFCS to confirm the 80 g reference amount suggested in the comment for the medium weight category (Ref. 41). Accordingly, the product category names for cakes have been renamed by type of cakes as suggested in the comments and the proposed middle two categories have been combined into one medium weight category with a reference amount of 80 g. The revised product category names and reference amounts are as follows:

Cakes, heavy weight (cheese cake; pineapple upside-down cake; fruit, nut, and vegetable cakes with more than or equal to 35 percent of the finished weight as fruit, nuts, or vegetables)—125 g

Cakes, medium weight (chemically 80 g leavened cake with or without icing or filling except those classified as light weight cake; fruit, nut, and vegetable cake with less than 35 percent of the finished weight as fruit, nuts, or vegetables; light weight cake with icing; Boston cream pie; cupcake; eclair; cream puff)—80 g

Cakes, light weight (angel food, chiffon, or sponge cake without icing or filling)—55 g.

The agency notes that although the cake categories are named by the type of cakes, not by the density, density was used as a guideline to group the cakes into the three categories. The heavy weight category includes cakes that weigh 10 g or more per cubic inch, the medium weight category includes cakes that weigh 4 g or more per cubic inch but less than 10 g per cubic inch, and the light weight category includes cakes that weigh less than 4 g per cubic inch. The density information described here provides guidance for cakes that may enter into the future market and do not fit in the cake types described in the product category names. The agency also notes that angel food, chiffon, and sponge cake without icing or filling that are prepared by traditional recipes and preparation methods are light and usually weigh less than 4 g per cubic inch. Therefore, they are included in the light weight category. However, if angel food, chiffon, or sponge cake contains heavy ingredients (e.g., fruits, chocolate chips, and nuts) that are usually not called for in the traditional recipes of these cakes, or if these cakes are processed in such a way as to increase the density, they will not be qualified to be called light weight cakes.

54. Two comments recommended a three-category system similar to the one discussed above but suggested that the medium weight category include only cakes without icing. The comments contended that the reference amount for the medium weight cakes with icing is not necessary because icing has a separate reference amount.

The system suggested by this comment will work for cakes with icing only. Many cakes have fillings. There is no reference amount for cake fillings. The agency is unable to determine a reference amount for cake fillings because there is no information from food consumption surveys or other sources to determine the customarily consumed amount of the fillings. Accordingly, FDA has not adopted this recommendation.

55. Some comments recommended that FDA include all cheese cakes other than New York style cheese cake in the medium weight category, rather than the heavy weight category. The comments contended that the 125 g reference amount is too large for non-New York-style (aerated) cheese cakes. One comment recommended that if FDA decides not to include cheese cake in the medium weight category, cheese cake should have a separate category with its own reference amount because cheese cakes differ from other cakes in many characteristics that affect the consumption size. The comment recommended 85 g as the reference amount for cheese cakes and submitted data collected by a "mail panel" survey that supported the 85 g reference amount.

FDA acknowledges that some commercially-prepared cheese cakes have air incorporated (aerated cheese cakes) and therefore, weigh much less than the unaerated (New York style) cheese cakes. The agency agrees with the comments that these aerated cheese cakes need a separate approach.

As discussed in section III.D.6. of this document, the agency has provided guidelines for determining the reference amount for products that are modified by incorporating air. If the aerated cheese cakes mentioned in the comment meet the 25 percent minimum reduction in density relative to the density of the appropriate unaerated cheese cake, manufacturers may use the "density-adjusted" reference amount for the aerated cheese cake following the guidelines described in section III.D.6. of this document, provided that the manufacturer will show FDA detailed protocol and records of all data that were used to determine the density-adjusted reference amount for the aerated cheese cake (see section III.D.6. for further discussion). Therefore, it is not necessary to create a separate category for aerated cheese cake or to establish a separate reference amount for aerated cheese cakes. Accordingly, FDA has retained the proposed 125-g reference amount for cheese cakes.

56. Some comments recommended that FDA include pound cake without icing in the light weight category with angel food, sponge, and chiffon cake without icing. The comments argued that USDA's density data used to convert a piece of pound cake to the g weight (conversion factor) were based on home recipes. The comments contended that commercially-prepared pound cakes are much less dense than the home-prepared versions. Thus, the conversion factor used in the NFCS was too high. Consequently, the amount customarily consumed for pound cake was overestimated. One comment recommended that if FDA decides not to include pound cake in the light weight category, pound cake should have a separate category with its own reference amount because pound cake differs from other cakes in many characteristics that affect the consumption amount. The comment recommended 45 g as the reference amount for pound cakes as a separate category and submitted data collected by a "mail panel" survey in support of the 45 g reference amount.

FDA disagrees with the comments. The cakes included in the light weight category (e.g., angel food, sponge, and chiffon cake) weighs less than 4 g per cubic inch (density). Commercial pound cakes without icing are much higher in density (about 6.1 g per cubic inch) than the cakes included in the light weight category (Ref. 48). The comment did not present density data to prove that commercial pound cakes weigh less than 4 g per cubic inch. All cakes that weigh more than 4 g per cubic inch, with the exception of those included in the heavy weight cake category, are

included in the medium weight cake category.

With regard to the survey data submitted in support of a separate reference amount of 45 g, FDA notes that in this survey, respondents were asked to record the total number of servings (slices) they usually get from a specific size of pound cake but were not asked how many slices each person in the household ate at a particular eating occasion. People often consume multiple slices at a single eating occasion. In addition, the survey included only frozen pound cake manufactured by the company that submitted the comment. The survey did not include the unfrozen, ready-to-eat forms of pound cake or competitors' products. Therefore, the data submitted in the comment do not represent all forms of pound cake in the marketplace. Therefore, the agency questions the representativeness and appropriateness of the data submitted in the comment and finds that they do not support a change in the reference amount.

FDA has thus concluded that the comments did not submit adequate data to justify the inclusion of pound cake without icing in the light weight category or to establish a separate category for pound cake with a reference amount of 45 g. Accordingly, the agency has retained pound cake without icing in the medium weight cake category.

57. One comment suggested a 90 g reference amount for all cakes.

Considering the large variability in the density of cakes, a uniform reference amount, regardless of the value, would result in a serving size too large for some cakes and too small for other cakes. The 90 g reference amount suggested would make the serving size for a light cake (e.g., angel food cake) a huge piece (e.g., about 1/3 of a 10 oz (about 8 inch diameter) angel food cake), whereas the serving size for a heavy fruit cake would be a small, thin slice.

58. One comment suggested separate reference amounts for cupcakes, 55 g for iced cupcakes and 35 g for un-iced cupcakes. The comment contended that the NFCS data suggest 55 g as the reference amount for frosted cupcakes and that the 55 g reference amount agrees with the reference amount for other products that are used interchangeably with cupcakes (e.g., muffins, Danish, doughnuts, coffee cakes). One comment requested that FDA establish a reference amount for assorted cupcakes.

FDA advises that the smallest reference amount for cake is 55 g for the light weight cake category. The cakes included in the light weight category (e.g., angel food, sponge, and chiffon cake) weigh less than 4 g per cubic inch. The comment did not present density data to prove that cupcakes weigh less than 4 g per cubic inch. All cakes that weigh more than 4 g per cubic inch, with the exception of those included in the heavy weight cake category, are included in the medium weight cake category. The labels of cake mixes that belong to the medium weight cake category (e.g., chocolate, yellow, or white cake) frequently provide preparation directions for a 2-layer cake, a sheet cake, and cupcakes. These label directions suggest that cupcakes are the same cake as a 2-layer or a sheet cake included in the medium weight category but differ only in shape, i.e., cupcakes are an individually shaped form of cake. The act directs the agency to establish uniform serving sizes. Therefore, the same food should have the same reference amount regardless of its shape. Thus, the agency included all cupcakes both with and without icing (including assorted cupcakes) in the medium weight category in this final regulation with the reference amount of 80 g. Accordingly, FDA has not established a separate reference amount for cupcakes.

59. One comment requested that FDA change the reference amount for muffins prepared at home, either from scratch or from a mix, to 45 g. The comment contended that a 45 g reference amount more closely approximates the weight of the muffin made with consumer baking pans.

FDA disagrees with the comment. First, food prepared at home from scratch is not subject to nutrition labeling. Secondly, the agency cannot establish a separate reference amount for the same food depending on the equipment used for preparation (e.g., commercial equipment versus equipment used at home). The reference amount for muffins is based on what consumption data show as the amount customarily consumed. Thus, it complies with the statute. Accordingly, FDA has not adopted this recommendation.

60. One comment suggested that FDA add microwave cakes to the coffee cake category. The comment stated that because of the characteristics of microwave cooking, microwave cakes have an unusually high density (7 to 7.5 g per cubic inch) and are very rich. According to the density classification, microwave cakes belong to the proposed medium weight category with the reference amount of 110 g. The comment contended that 110 g is too large for the microwave cakes. The comment, therefore, suggested including microwave cakes in the coffee cake category.

FDA does not agree that microwave cakes should be grouped with the products in the coffee cake category because microwave cakes are not used interchangeably with the products in the coffee cake category. Microwave cakes are a kind of cake that differs from other cakes only in that they are prepared in the microwave oven rather than in the conventional-type oven. Therefore, microwave cakes belong to a cake category. The agency points out that all cakes other than those classified as heavy weight and light weight are included in the medium weight category in the final regulation. The 7 to 7.5 g per cubic inch density for microwave cakes that the comment reported is within the range of the density of cakes in the medium weight cake category (4 g or more per cubic inch but less than 10 g per cubic inch). The agency notes that the reference amount for this new medium weight category is 80 g, not 110 g. Therefore, the agency has provided the relief that the comment sought, although for different reasons.

(9) Bakery products: crackers, all varieties excluding sweet and sandwich type—includes hard bread sticks and ice cream cones

FDA proposed 15 g as the reference amount for this product category.

61. Several comments argued that it is unfair to have two different reference amounts for competing products (i.e., crackers and snacks) that are used interchangeably. The comments requested that FDA establish a uniform reference amount for snacks and "snack crackers." If not, the comments asserted that a false impression will be created that snack crackers are lower in fat than the competing snack products. Some of these comments pointed out that some products that are more appropriately classified as snacks bear the name cracker (e.g., Cracker Crisps). A manufacturer suggested defining snacker crackers as crackers to which oil has been applied after baking (postbaking oil application).

FDA agrees with the comment that many crackers are used interchangeably with products in the snacks category. The agency acknowledges that it is very difficult to draw a line between cracker and snack products. Therefore, FDA has reexamined the products included in the cracker category and has concluded that it is more reasonable to divide it into two categories: Crackers that are usually not used as snacks and crackers that are usually used as snacks, based on their customary usage, how they are positioned in the marketplace, and the

amount of the cracker that is customarily consumed.

The former category includes saltines, soda crackers, and oyster crackers. These crackers are usually used as part of the meal (e.g., with soup) rather than as snacks. Reanalysis of the data from the 1977–1978 NFCS and the 1987–1988 NFCS showed that the proposed 15-g reference amount is reasonable for crackers that are usually not used as snacks. However, the customarily consumed amount of other crackers is closer to 1 oz than to 0.5 oz. Therefore, the agency has concluded that the cracker category should be divided into two categories with separate reference amounts. Accordingly, FDA has revised the cracker category as follows:

Crackers that are usually used as snacks—30 g

Crackers that are usually not used as snacks—15 g

The agency could not use the postbaking oil application suggested in the comment to divide the cracker category into "snack crackers" and "nonsnack crackers" because manufacturers can change the practice of the postbaking oil application, and therefore, a classification system based on this application could easily become irrelevant.

(10) Bakery products: French toast, pancakes

FDA proposed 110 g as the reference amount for this product category.

62. One comment recommended that FDA combine French toast and pancakes with waffles, with a reference amount of 85 g. The comment contended that these products "make similar contributions to the diet and are customarily consumed in the same way."

FDA agrees that French toast, pancakes, and waffles are used interchangeably in the diet. However, because French toast and pancakes are denser than waffles, the amount customarily consumed in g is much larger for French toast and pancakes than for waffles. Food consumption data do not support the 85 g reference amount for French toast and pancakes suggested in the comment (Ref. 2). Therefore, these foods cannot be grouped into one category. Accordingly, FDA has retained reference amounts for French toast and pancakes as proposed.

63. One comment recommended that FDA add a new category for dry pancake mix and variety mixes with a reference amount of 55 g. The comment contended that 55 g is equivalent to the amount of mix required to make three 4-inch pancakes, which is equivalent to the reference amount proposed by FDA.

New § 101.12(c) provides that the reference amount of a product that requires cooking or the addition of water or other ingredients be the amount required to prepare one reference amount of the final product as established in new § 101.12(b). Therefore, the reference amount for dry pancake mix will be the amount of the mix required to make one reference amount of the prepared product, so there is not need to establish a reference amount for dry pancake mix. Moreover, this approach is more reasonable than that suggested by the comment because pancake mixes come both in complete and incomplete forms, and the amount to make one reference amount may differ for the different forms.

Because variety mixes are used for many different purposes, the agency agrees with the comment that a reference amount for the dry form would be desirable so that all variety mixes will have a uniform label serving size to facilitate nutrition comparisons of different brands. Otherwise, different brands may choose different uses as the basis to determine the amount of the dry mix to make one reference amount of the prepared food.

According to the product label, a major use of variety mixes is to make pancakes. Using the recipe file for the 1987–1988 NFCS (Ref. 49), the agency has estimated that about 40 g of dry mix is needed to make one reference amount of the prepared pancakes. Therefore, FDA has established the reference amount for the variety mixes to be 40 g of dry mix. Accordingly, the agency has revised the product category to read: "French toast, pancakes, variety mixes." The reference amount has been revised to read: "110 g prepared for French toast and pancakes; 40 g of dry mix for variety mixes."

(11) Bakery products: pies, cobblers, turnovers, other pastries

FDA proposed 125 g as the reference amount for this product category.

64. A comment from a trade association for bakery products supported the proposed reference amount. A few other comments opposed the 125-g reference amount. One comment requested that FDA change the reference amount to 4 oz (110 g) based on the size of 1/6 and 1/8 of pies tested. Another comment argued that the proposed reference amount would result in an extremely large serving size for some pies (e.g., 1/3 of an 8-inch frozen cream pie) and a small serving size for other pies (e.g., 1/10 of a 10-inch fruit pie). The comment recommended that FDA establish three separate reference amounts: 1/6 of a pie for 8 inch pies, 1/8 of a pie for 9-inch or larger pies, and 125 g for individual pies and pastries. The comment submitted estimates of amounts consumed per serving for various pies that it manufactures which were derived from a "Mall Intercept Method" survey conducted in 15 cities in the United States. The survey was designed to recruit people who are representative of the demographic and socioeconomic characteristics of the people who buy the test products based on the sales data for frozen pies.

FDA carefully examined all data submitted in the comments. FDA disagrees with the request to change the reference amount to 4 oz. The data submitted in support of the 4-oz reference amount do not represent food consumption data collected under actual conditions of use or an estimate representative of all types and varieties of products included in the product category.

FDA also disagrees with the comment that contended that reference amounts should be expressed in fractions of pies. The agency used fractions as the reference amount for pie crust because in this particular case, fractions are the most meaningful measure, and there is not much concern about the manipulation of the serving size for the pie crust. Because pies come in different diameters and heights, reference amounts based on fractions of pies would result in different reference amounts for different size pies of the same brand as well as for different brands of the same kind of pie. Therefore, there would be no uniform basis to evaluate the qualification for claims on pies. For example, data submitted in the comment showed that the reference amount based on fractions of pies for one brand alone could vary from 64 to 163 g. Furthermore, reference amounts based on fractions of pies may encourage the manipulation of the reference amount to produce a more favorable presentation of the nutrition information or to qualify for a claim by changing the diameter or height.

The agency, however, agrees that the 125-g reference amount would result in an unreasonably large serving size for frozen cream pies. These commercially prepared frozen cream pies differ from homemade cream pies. Commercial cream pies are aerated and thus weigh much less than homemade cream pies. Therefore, FDA believes that these pies need a separate approach that is more reasonable for aerated cream pies.

As discussed in section III.D.6. of this document, the agency has provided guidelines for determining the reference amount for products that are modified by incorporating air. If the aerated

cream pies mentioned in the comment meet the 25 percent minimum reduction in density relative to the density of the appropriate unaerated cream pie, manufacturers may use the "density-adjusted" reference amount for the aerated cream pie following the guidelines described in section III.D.6. of this document, provided that the manufacturer will show FDA detailed protocol and records of all data that were used to determine the density-adjusted reference amount for the aerated cream pie (see section III.D.6. for further discussion). Therefore, it is not necessary to establish a separate reference amount for aerated cream pies. Accordingly, FDA has retained the proposed 125-g reference amount for cream pies.

(12) Bakery products: taco shell

FDA proposed 30 g as the reference amount for this product category.

65. A comment from a trade association for bakery products supported the proposed reference amount. Another comment recommended that FDA change the reference amount to 15 g which is equivalent to 1 taco shell. The comment contended that one filled taco shell equals the reference amount for the mixed dishes not measurable with cup category (140 g).

FDA disagrees with the latter comment. The agency points out that according to the USDA manual (Ref. 31), one filled taco weighs about 70 to 80 g. Therefore, two filled tacos would approximate one reference amount for filled tacos. Accordingly, FDA has retained the reference amount as proposed.

(13) Bakery products: waffles

FDA proposed 85 g as this reference amount for the product category.

66. Two comments from a trade association for bakery products and a manufacturer supported the proposed reference amount. One comment from another manufacturer opposed the 85-g reference amount. The comment contended that the 85-g reference amount would make the serving size for some of their waffles three waffles instead of two. The comment recommended that FDA revise the reference amount for waffles to state "85 g, and not to exceed 2 waffles or 2 sets of connected waffles, if their total weight is 67 percent of the reference amount or more." The comment submitted data from a "Mall Intercept Method" survey conducted in 15 cities in the United States to support that people customarily consume 2 waffles or 2 sets of connected waffles. The comment also requested that FDA allow manufacturers to provide nutrition information per waffle or per 1 set of waffles.

FDA advises that it is inappropriate to call 2 pieces of a product that weigh 67 percent of the reference amount one serving when 3 pieces are equal to one reference amount. In addition, FDA notes that the 85-g reference amount was derived using data from large national food consumption surveys that were collected under actual conditions of use and included all types of waffle products (dry mixes and frozen) and many different brands available in the marketplace. The agency finds that it would be inappropriate to modify the reference amount to make it consistent with questionable data submitted in the comment.

The data submitted in the comment have several problems. First, they are not food consumption data that were collected under actual conditions of use. People were asked to show the number of waffles that the participants and other members of their families normally eat. People did not answer or record the number of waffles that they actually ate during the survey days. In addition, the survey tested only frozen waffles manufactured by the company that submitted the comment. Waffles come in dry mixes and frozen prepared forms. There are many different brands of waffle products in the marketplace. Therefore, it is questionable if the data submitted in the comment are representative of all waffle products in the marketplace.

Accordingly, FDA has retained the reference amount as proposed. The agency notes that new § 101.9(10)(ii) allows voluntary labeling of a second column of values per unit for products in discrete units.

(14) Beverages: all categories

Because FDA proposed a uniform 240-mL (8-fl oz) reference amount for all beverages, comments on all the categories under Beverages are considered together.

67. Comments from several manufacturers and trade associations and a comment from a nutrition professional organization supported the proposed uniform 8-fl oz reference amount for all beverages. There were no objections to the 8-fl oz reference amount for carbonated beverages, wine coolers, or water. However, two comments from the carbonated beverage industry stated that if FDA abandons the uniform 8-fl oz reference amount, they want a 6-fl oz reference amount for carbonated beverages. Comments from coffee and tea manufacturers and their trade associations opposed the 8-fl oz uniform reference amount. These comments contended that the reference amount for coffee and tea should be 180 mL (6 fl oz). Among other things, these comments argued that: (1) 6 fl oz is the serving size currently used by the industry, in recipe books and other literature, (2) hot beverages are generally not used interchangeably with cold beverages, and (3) standard coffee cups as well as the graduation on coffee makers and pots are designed for 5 1/2- to 6-fl oz serving sizes. The comments contended that changing the serving size for coffee to 8 fl oz would cause unnecessary costs to manufacturers to change the graduation on the coffee making apparatuses. Such cost increases would be passed on to consumers.

First, FDA advises that new § 101.9(j)(4) exempts plain coffee and tea from all requirements of the nutrition labeling regulation. Accordingly, the reference amount for plain coffee and tea has been deleted from Table 2 in new § 101.12(b). As for the reference amount for flavored and sweetened coffee and tea, the agency points out that food consumption data support the 8-fl oz reference amount for these coffees and teas (Ref. 2). The agency notes that unlike plain coffee, flavored and sweetened coffee are not made in coffee makers, and thus there is no concern about changing the graduation on the coffee making apparatuses which would increase the cost of coffee. Flavored and sweetened tea (e.g., iced tea mixes) is also used interchangeably with other cold beverages. Considering the weight of support for the uniform 8-fl oz reference amount for all beverages and the reasons stated here, the agency has concluded that the uniform 8-fl oz reference amount for all beverages including flavored and sweetened tea is appropriate under section 403(q)(1)(A)(i) of the act. Accordingly, FDA has retained the reference amount as proposed for all beverages under the beverages category except for plain coffee and tea. The uniform reference amount for all beverages facilitates nutrition comparisons among different beverages.

(15) Cereals and other grain products: breakfast cereals (hot cereal type), hominy grits

FDA proposed 1 cup prepared or 40-g plain dry cereal or 55-g flavored, sweetened dry cereal as the reference amounts for this category.

68. Several comments opposed the proposed reference amounts for the dry cereal form. One comment recommended that FDA change the

reference amount to 1-oz dry because this amount is more consistent with current labeling practices by manufacturers. Another comment recommended a 35-g uniform reference amount for all cereals, including hot and ready-to-eat cereals (and a 50-g reference amount for a second category if a second category is necessary). The comment did not submit any supporting data for the recommended reference amounts. A manufacturer of hot cereals recommended that FDA use a uniform reference amount of 40 g for both regular, and flavored and sweetened cereals. To support the uniform 40-g reference amount, the comment submitted estimates of the dry weight of cereals derived from the mean consumed amounts from the 1987–1988 NFCS for the two types of cereals (regular and quick hot cereals and instant hot cereals) and the conversion factors it used to determine the dry weight from the prepared weight.

Under the act, the serving size must reflect an amount customarily consumed, not the current labeling practices by manufacturers. Therefore, the agency cannot change the reference amount derived from the food consumption data, which represents the customarily consumed amount, to make it consistent with the current labeling practices.

With regard to the comment that recommended a uniform reference amount of 40 g for all hot cereals, FDA carefully examined the data submitted in support of the uniform 40-g reference amount. The data showed that the mean intake for the instant cereal was lower than the mean intake for the regular and quick cereal because many instant cereals come in single-serving packages, and the single-serving packages currently on the market generally contain less than the amount of dry cereal required to make one reference amount (1 cup) of the prepared cereal. Therefore, the mean consumed amount of flavored and sweetened cereals was lower than that of regular and of quick hot cereals.

Basing the reference amount on the data in the comment would result in using two different bases for determining the reference amount for hot cereals: (1) Regular and quick hot cereals would reflect the amount customarily consumed from multiserving containers, and (2) flavored and sweetened hot cereals would reflect the amount customarily consumed from current single-serving containers. As the comment pointed out, the flavored and sweetened hot cereals currently come in single-serving containers only. However, although the amount of hot dry cereal customarily consumed may remain the same, the single-serving container size may change, or these products may be available in multiserving containers in the future. Therefore, the agency has concluded that the reference amounts for both varieties of hot dry cereal must reflect the multiserving containers.

FDA's independent analysis, using both the 1977–1978 NFCS and the 1987–1988 NFCS showed that the amount customarily consumed for the plain dry hot cereals is 40 g (Ref. 41). The flavored and sweetened hot cereals, however, contain additional ingredients (e.g., sugar, dried fruit) and, therefore, weigh more than plain dry hot cereals on an "as packaged" basis. Based on the difference in weight of plain dry hot cereal and flavored and sweetened cereal, FDA estimated the difference in weight to be, on the average, about 15 g (Ref. 2). Therefore, the reference amount for flavored and sweetened hot cereals must include the 15-g extra weight to account for the additional ingredients. Accordingly, FDA has retained the reference amount as proposed (55 g). The agency points out, however, that according to new§ 101.9(b)(2)(i) and (b)(6), the serving sizes of all single-serving packages of hot cereals will be one package.

(16) Cereals and other grain products: breakfast cereals, ready-to-eat, all categories

FDA proposed three reference amounts for ready-to-eat cereals depending on the density or shape of the cereal: 1 cup for cereals weighing less than 3 oz per cup; 1/2 cup for cereals weighing more than or equal to 3 oz per cup; and 50 g for cereals not measurable with a cup (e.g., biscuit type).

69. Most comments objected to the reference amount in a volumetric (cup) measure because of the lack of precision in the measurement of the g weight of the cup measure. The comments preferred weight-based reference amounts. One comment stated that the volumes of small pieces of dry solids can be accidentally altered or even intentionally manipulated to reach different volumetric measurements. Cereals' shapes, sizes, ingredients, and textures, as well as handling practices, settling characteristics, measurement methods, and timing can affect the accuracy of measurements. The comment contended that measured g weights of the servings by two persons trained to follow identical procedures varied not only for servings from the top to the bottom of the boxes but at identical levels of different boxes. Overall, the g weights of the individual cup measurements differed by more than two-fold (29 to 68 g). The comment contended that because there are large variabilities in the estimates for g-weight-per-cup measure, the specific g-weight measure a manufacturer chooses to declare on the label may be arbitrary and, worse, may be manipulated in order to permit nutrient content claims.

As a solution to the problems discussed above, some comments recommended a uniform weight-based reference amount for all ready-to-eat cereals. Others recommended that the cereals be divided into two categories based on density with separate weight-based reference amounts. For a uniform reference amount, a health professional organization recommended 1 oz, and a cereal manufacturer recommended 35 g. Comments that recommended the two-category system differed in both how the two categories should be split and the reference amounts for the two categories. One comment suggested a 35-g reference amount for all cereals and, if a second category is necessary, 55 g for the second category. The comment did not provide details about what products the second category should include. Another comment recommended a 15-g reference amount for plain puffed cereal grains and a 35 to 40 g reference amount for all other cereals. Two other comments recommended a 30-g reference amount for cereals weighing less than 43-g per cup and for cereals that contain at least 8 g of fiber per oz, and a 55-g reference amount for cereals weighing 43 g or more per cup.

The comments provided a good description of the difficulties in accurately determining the g weight equivalents of the cup measures of ready-to-eat cereals. FDA acknowledges the characteristics of ready-to-eat cereals that present particular problems in determining the g-weight equivalents of household measures. The agency agrees with the comments that volume-based reference amounts present compliance problems and may result in manipulation of the serving size. Therefore, FDA has concluded that the reference amounts for ready-to-eat cereals should be in g quantities.

FDA carefully examined the weight-based reference amounts suggested in the comments. FDA does not believe that a uniform reference amount for all ready-to-eat cereals is appropriate. Regardless of the value, a uniform reference amount would result in serving sizes that are too large for some cereals and too small for others. For example, the 35-g reference amount

suggested in the comment would result in serving sizes that range from about 1/4 cup for heavy cereals (e.g., sweetened granola-type cereals) to about 3 cups for light cereals (plain puffed rice or wheat). These serving sizes are not consistent with the amounts of these types of cereals customarily consumed. Food consumption data showed that customarily consumed amounts for the heavy cereals are about 1/2 cup and for the light cereals about 1 cup (Ref. 41).

FDA also carefully examined all reference amounts for the two-category system suggested in the comments. One of the comments submitted a detailed description and results of an analysis of data from the 1987–1988 NFCS to support the 43-g per cup dividing line, with 30- and 55-g reference amounts. FDA has done an independent data analysis of ready-to-eat cereals and confirmed the validity and reasonableness of the reference amounts recommended in the comment for most cereals (Ref. 41).

However, the agency does not believe that the 30-g reference amount is reasonable for light cereals that weigh less than 20-g per cup (e.g., plain puffed rice or wheat). The 30-g reference amount would result in a serving size that is about 2 to 2 1/2 times the customarily consumed amounts of these cereals. Therefore, FDA has divided the category for cereals weighing less than 43 g per cup into 2 categories: Cereals weighing less than 20 g per cup, which primarily consist of plain puffed cereal grains, and cereals weighing 20 g or more but less than 43 g per cup. Following the principles and procedures described in the 1991 serving size proposal, FDA has determined the reference amount for light cereals to be 15 g (Ref. 41).

Accordingly, FDA has revised the product categories, and the reference amounts, for ready-to-eat cereals as follows:

Breakfast cereals, ready-to-eat weighing less than 20 g per cup, (e.g., plain puffed cereal grains)—15 g

Breakfast cereals, ready-to-eat weighing more than 20 g but less than 43 g per cup; high fiber cereals containing 28 g or more of fiber per 100 g—30 g

Breakfast cereals, ready-to-eat weighing 43 g or more per cup; biscuit types—55 g

70. Other comments on the reference amounts for ready-to-eat cereals included objections to some specific aspects of the methodology used to determine the reference amounts. One comment objected to the first step used in determining the product categories (56 FR 60394 at 60403) for cereals. This step divided the cereals into subcategories according to "other characteristics" that are likely to affect the levels of consumption of foods within the product class, i.e., in this case, the density of the cereals. Other comments objected to relying solely on the 1987–1988 NFCS in determining the reference amount for cereals measurable with a cup. Another comment stated that USDA's density information that FDA used to categorize ready-to-eat cereals differed from the manufacturers' data for at least 11 cereals.

As mentioned above, the amounts customarily consumed for ready-to-eat cereals vary by the density of the cereal. Therefore, the step that divided the cereals into subcategories by density was necessary in order to determine the appropriate amounts customarily consumed for specific types of cereals. As explained in the technical report (Ref. 2), FDA relied solely on the 1987–1988 NFCS because many new cereals have been introduced since the 1977–1978 NFCS, and the 1977–1978 NFCS did not contain food consumption data or density information for the new varieties. Also, density information in the 1977–1978 NFCS was not as useful as that in the 1987–1988 NFCS even for cereals that existed at the time of, or prior to, the 1977–1978 NFCS. Also cereals that differed in density had often been combined into one food code in the 1977–1978 NFCS. In the 1987–1988 NFCS, however, USDA greatly expanded the list of ready-to-eat cereals and their density information. FDA continues to believe that ready-to-eat cereals need to be divided into subcategories, and that it is necessary to rely solely on the 1987–1988 NFCS to estimate the amounts customarily consumed for the cereals currently on the market and to reflect the more recent data on density.

With regard to the discrepancy in measurements of densities of ready-to-eat cereals between USDA and manufacturers' data, the comment did not specify the cereals for which there was a discrepancy, or how large the discrepancies were. USDA's density information is the most current and the best data available to FDA. These density measurements were done without any knowledge about a possible use in nutrition labeling. Therefore, there was no manipulation of the measurements to provide a favorable nutrition profile or to be able to make a claim. In light of the extreme difficulties in measuring the g weights of cup measures and the lack of well-established standard procedures for measuring the g weights of cup measures for ready-to-eat cereals, FDA will use USDA's measurements for compliance purposes to check for proper categorization of ready-to-eat cereals. USDA's density data can be found in Reference 45.

If a manufacturer does not agree with USDA's density data, the manufacturer can petition FDA for a reevaluation of the density of a particular cereal. The manufacturer should submit density data that includes a detailed description of the methodology used (e.g., materials and equipment used, procedures followed), name and qualification of the operator, records of all individual measurements, the mean and the standard deviation of the measurements, and any other information that may help FDA to evaluate the density of the product in question. Density measurements should be repeated a sufficient number of times to produce a reliable estimate. In determining the density, manufacturers should also follow FDA's general Guidelines for Determining the Gram Weight of the Household Measure mentioned in new § 101.9(b)(7).

(17) Cereals and other grain products: flours or cornmeal

FDA proposed 30 g as the reference amount for this product category.

71. One comment opposed the 30 g reference amount for bread. The comment contended that their research showed that 55 g (2 oz) of flour is needed to make 2 slices of homemade bread. The comment stated that they used 2 slices as the amount customarily consumed because the 1977–1978 NFCS showed that consumers typically consume 2 slices of bread per eating occasion regardless of the density. Because the primary use of flour is homemade bread, and homemade bread is typically more dense than commercially-made bread, the comment argued that more flour is needed to make 2 slices of homemade bread than 2 slices of commercial bread. The comment did not submit the protocol for the research upon which it relied or data in support of the suggested change in the reference amount.

FDA disagrees with the comment. The agency notes that the comment's assumption that the amount customarily consumed in g is larger for homemade bread than for commercial bread is wrong. Data from the 1977–1978 NFCS and the 1987–1988 NFCS showed that the amount customarily consumed of homemade bread is not greater than 55 g (Ref. 41). The 30-g reference amount is the amount of flour required to make 55 g of bread. Accordingly, FDA retained the reference amount as proposed.

(18) Cereals and other grain products: grains, e.g., rice, barley, plain

FDA proposed 140 g prepared or 45 g dry as the reference amount for this product category. The agency notes that the product category name in the 1991 serving size proposal (56 FR 60394 at 60418) had a typographical error and included seasoned rice. A correction notice was published on March 6, 1992 (57 FR 8179).

72. Several comments from the rice industry stated that the proposed reference amount was based on the 1977–1978 NFCS data which are outdated. The comments argued that rice consumption patterns have changed since the 1977–1978 NFCS, and that the proposed 140-g reference amount does not reflect the amount of rice customarily consumed today. The comments contended that rice products introduced since the 1977–1978 NFCS (e.g., rice mixes) are customarily consumed in 1/2-cup servings. None of the comments submitted food consumption data to support this claim. One comment pointed out that the 140-g prepared reference amount yields different cup measures for different types of rice, and therefore, the label serving size will differ for different types of rice. The comment contended that rice is easily and conveniently measured with a cup, and that a reference amount that is expressed in a volume measure would yield more consistent label serving sizes for different types of rice. The comment recommended 3/4 cup prepared as the reference amount and submitted the g weights per cup measures of different types of rice in support of the 3/4-cup reference amount. A few comments requested that FDA delete the reference amount for the dry form because the customarily consumed amounts are more consistent on a prepared basis among different types and forms of rice.

FDA advises that it used both the 1977–1978 NFCS and the 1987–1988 NFCS to determine the reference amount for plain rice (Ref. 2). In the 1991 serving size proposal, seasoned rice mixes were included in the Mixed dishes measurable with cup category (see further discussion on seasoned rice mixes under the Mixed dishes measurable with cup category).

FDA disagrees that the reference amount for cooked rice should be expressed in cups. Although cup is the household measure most appropriate for expressing the label serving size for rice, its use in defining the reference amount for rice is not desirable for several reasons. First, cooked rice has several unique characteristics that make it difficult to accurately determine the g weight of the cup measure. For example, cooked rice is not free-flowing, and when cooked, some rice becomes sticky. Secondly, there is no well-established procedure for determining the g weight of the household measure. Therefore, if the reference amount is expressed in cups, the parenthetical metric measure that is used for compliance monitoring would be inaccurate. Thus, the agency has concluded that it is more important to have the reference amount in the most accurate measure possible, i.e., in g. In addition, comments on the 1990 proposal wanted a uniform "standard" serving size (equivalent to the reference amount in the 1991 serving size proposal) for pastas and rice. Changing the reference amount for rice to 3/4 cup would make the reference amounts for these two foods nonuniform. Accordingly, FDA has retained the reference amount of cooked rice as proposed (140 g).

FDA also disagrees that the reference amount for the dry form should be deleted. Because the weight of the cooked rice depends on the amount of water used in the preparation, the amount required to make one reference amount in cooked form can vary widely. The reference amount on a cooked basis also opens a door to a manipulation of the reference amount for dry rice. Therefore, if the reference amount for rice is expressed only on a cooked basis, FDA cannot effectively monitor the compliance. Consequently, the agency rejects this recommendation and has decided to retain the reference amount for the dry form as proposed.

(19) Cereals and other grain products: pastas, without sauce

FDA proposed 140 g prepared or 55 g dry as the reference amount for the product category.

73. A comment from a trade association for pasta products supported the proposed reference amount. One comment contended that because FDA relied on the 1977–1978 NFCS and the 1987–1988 NFCS, refrigerated filled pastas were not adequately represented. The comment argued that the refrigerated filled pastas (e.g., tortelloni, tortellini, and ravioli) were introduced to the market in 1987, and the comment further argued that a study of consumer "habits and attitudes" done by a company showed that people eat smaller portions of meat and cheese filled pastas compared to "cut pasta." Therefore, the comment recommended a 100 g reference amount for filled pasta and claimed that 100 g most closely agrees with the amount customarily consumed of filled pasta. The comment did not submit the results of the consumer "habits and attitudes" study or data supporting the claim that 100 g represents the amount customarily consumed for filled pasta.

FDA advises that this category includes only plain pastas. Filled pastas contain components from two or more food groups, pasta and filling from another food group (e.g., cheese, meat). Filled pastas are included in the Mixed dishes measurable with cup category (Refs. 2 and 20). Because the refrigerated filled pastas were introduced into the market in 1987, there were more reportings of these products in the 1987–1988 NFCS than in the 1977–1978 NFCS. The 1987–1988 NFCS had a total of 67 individual eating occasions of ravioli and tortellini. The customarily consumed amount was 1 cup or about 200 g without sauce (Ref. 41), not 100 g. Accordingly, FDA has retained filled pasta under the Mixed dishes measurable with cup category, with a reference amount of 1 cup. For clarity, the agency has revised the product category name to read: "Pastas, plain."

74. A few comments stated that the proposed 140 g reference amount is too large for lasagna noodles because lasagna noodles are used only as an ingredient of lasagna. One comment recommended 2 oz prepared as the reference amount for lasagna noodles. The comment contended that 2-oz prepared would be consistent with the amount of lasagna noodles required to make one reference amount of lasagna, but the comment did not explain how it arrived at this amount. Another comment recommended 1-oz dry as the reference amount for lasagna noodles. The comment contended that this amount is reasonable because it is half of the reference amount for the dry form of other pastas in the category.

FDA acknowledges that lasagna noodles have a specific usage, i.e., they are customarily consumed as an ingredient of lasagna. However, other pastas in this category are also used primarily as an ingredient of other foods (e.g., spaghetti noodles in spaghetti, macaroni noodles in macaroni and cheese or macaroni salad). Because neither comment explained or submitted data in support of the recommended reference amount for lasagna noodles, FDA has independently estimated the amount of lasagna noodles that are required to make one reference amount (1 cup) of lasagna. Using the recipe file for the 1987–1988 NFCS (Ref. 49) and the percent yield information reported by USDA (Ref. 18), the agency has estimated that about 3.5-oz prepared or about 1.5-oz dry lasagna noodles are

needed to make 1 cup of lasagna (Ref. 50). These values are considerably larger than the 2 oz prepared and 1 oz dry that were suggested in the comments. The data from the 1977–1978 NFCS and the 1987–1988 NFCS showed that customarily consumed amounts of products in this category vary widely, and the 3.5-oz cooked lasagna is well within one standard deviation of the mean customarily consumed amount (Ref. 41). Considering the large variability in customarily consumed amounts of pastas, the relatively small difference between the amount of lasagna required to make one reference amount of lasagna and the reference amount for the pasta category, and that lasagna is not the only pasta used as an ingredient, the agency has concluded that a separate reference amount specific for lasagna noodles is not warranted. Accordingly, FDA had retained the reference amount as proposed.

(20) Dairy products and substitutes: cheese, grated hard, e.g., Parmesan and Romano

FDA proposed 5 g as the reference amount for this product category.

75. One comment contended that the 5-g reference amount is too small and requested that FDA change it to 1 tbsp. FDA advises that 5 g is equivalent to 1 tbsp. in terms of volume. Accordingly, FDA has retained the reference amount as proposed.

(21) Dairy products and substitutes: eggnog

FDA proposed 120 mL as the reference amount for this product category.

76. One comment requested that FDA change the reference amount to 8 fl oz to make it consistent with the reference amounts for other beverages.

FDA does not believe that a uniform 8-fl oz reference amount is necessary for eggnog. Eggnog differs from other beverages. It usually is not used interchangeably with other beverages. Eggnog is a special type of beverage that is customarily served at special occasions (e.g., holidays and parties) and is customarily consumed in amounts smaller than other beverages, such as soft drinks. Comments on the 1990 proposal supported the 120 mL (4 fl oz) reference amount. Food consumption data did not provide a reasonable basis to increase the reference amount to 8 fl oz. Therefore, FDA has retained the reference amount as proposed.

(22) Dairy products and substitutes: milk, evaporated, undiluted

FDA proposed 15 mL as the reference amount for this product category.

77. Several comments from the dairy industry opposed the proposed reference amount. The comments contended that: (1) Evaporated milk is used interchangeably with condensed milk in recipes, (2) the proposed reference amount reflected the use of evaporated milk in coffee, and (3) evaporated milk is used more often as an ingredient of other foods, and 30 mL is closer than 15 mL to the amount used as an ingredient. The comments requested that FDA change the reference amount to 30 mL. One comment submitted data from a recent survey on the use of evaporated milk involving 2,000 households that showed that about 70 percent of the households surveyed used evaporated milk as an ingredient in recipes as opposed to about 35 percent of the households that used it in coffee. The comment also submitted results from a study done by a manufacturer that showed the amounts of evaporated milk consumed per serving of the recipes most frequently used by consumers.

FDA carefully examined the arguments and data submitted in the comments. The agency agrees that evaporated milk is used primarily as an ingredient of other foods, and that the amount customarily consumed as an ingredient is generally larger than the proposed reference amount. The data submitted in the comment showed that the amount of evaporated milk, as an ingredient, consumed per serving ranged mostly from 20 to 50 mL. The mid-range of these values is 35 mL (about 1 fl oz). Because the major use of evaporated milk is as an ingredient, the agency has concluded that the reference amount for evaporated milk should reflect the amount used as an ingredient. Following the principles in expressing the reference amounts for fluids described in the 1991 serving size proposal (56 FR 60394 at 60406), the agency has determined the reference amount for evaporated milk to be 30 mL. Accordingly, FDA has revised the reference amount to 30 mL.

(23) Dairy products and substitutes: milk, milk-based drinks, e.g., instant breakfast, meal replacement, cocoa

FDA proposed a uniform 240 mL (8 fl oz) as the reference amount for all beverages.

78. Comments from several manufacturers and trade associations and a comment from a nutrition professional organization supported the proposed uniform 8-fl oz reference amount for all beverages. A few comments requested that FDA create a separate category for hot cocoa or hot cocoa and cocoa beverages with a reference amount of 6 fl oz. The comments contended that 70 percent of the servings of hot cocoa mix sold are in single-serving envelopes that yield a 6-fl oz serving, and that hot cocoa sold from vending machines also has a 6-fl oz serving.

Cocoa beverages are a type of flavored and sweetened milk beverages. FDA does not believe that it is appropriate to have two different reference amounts for flavored and sweetened milk beverages, one for cocoa beverages and one for other flavored and sweetened milk (e.g., chocolate milk, malted milk). Cocoa beverage mixes are available both in single-serving and multiserving containers. These beverage mixes are consumed both hot or cold and interchangeably with other hot or cold beverages. Food consumption data showed that the amount customarily consumed for cocoa beverages is 8 fl oz (Ref. 41). FDA also notes that the 6-fl oz single-serving envelopes in a multiserving container are single-serving units according to new § 101.9(b)(2)(i), and therefore, the serving size will be one envelope. Considering the weight of the support for the uniform 8-fl oz reference amount for all beverages, food consumption data, and the other reasons stated here, the agency concludes that 8 fl oz is the appropriate reference amount for cocoa beverages under the act. Accordingly, FDA has retained the reference amount as proposed.

(24) Dairy products and substitutes: yogurt

FDA proposed 225 g as the reference amount for this product category.

79. Two comments requested that FDA change the reference amount to 170 g (6 oz). One comment argued that the mean consumed serving from the 1987–1988 NFCS was 6.9 oz, and this value rounded to the nearest container size would be 6 oz. Another comment contended that recent data from a marketing survey on yogurt sales showed that 6 oz rather than 8 oz would be a more appropriate reference amount. The comment stated that on a pound-volume basis, the survey showed that 40 percent of all yogurt was packaged in 6-oz containers or smaller, and approximately 60 percent was packed in 8-oz containers. The comment claimed that when these data were converted to a per serving basis, they showed that 52 percent of yogurt was eaten from 6-oz containers or smaller. The comment did

not submit actual survey data or explain how the 5?-percent estimate on a per serving basis was derived.

FDA disagrees with all requests for a change in the reference amount for this category. As for the comment that requested a change based on the mean intake of yogurt from the 1987–1988 NFCS, FDA advises that it is not using the mean alone or a reference amount that is solely based on the 1987–1988 NFCS for the reasons explained in section III.D.1. of this document, unless there is a valid reason for doing so (e.g., trends that are confirmed by another survey that had a high response rate, or information was not available in the 1977–1978 NFCS).

As for the comment that requested a change based on the sales volume of single-serving yogurt containers, FDA notes that sales data are not consumption data and do not necessarily equate to consumption data. For example, some people could have consumed two 4-oz containers of yogurt which makes the consumed amount 8 oz, while the sales data would have counted two 4-oz containers. It is not clear how the comment derived the percent estimates on a serving basis from the sales data. FDA's independent analysis of the sales data from the same source as the comment showed that both on a pound basis and on a serving basis, 8-oz containers were clearly the major container size (Ref. 51). On a pound basis, containers that were 6 oz or smaller accounted for about 21 percent of the total weight, whereas 8-oz containers accounted for about 59 percent. On a serving basis, the respective values were about 27 and 54 percent (Ref. 51). Therefore, the sales data also supported the 8-oz reference amount derived from food consumption data.

Accordingly, FDA has retained the reference amount as proposed.

(25) Desserts: ice cream, ice milk, frozen yogurt, sherbet: all types, bulk and novelties (e.g., bars, sandwiches, cones)

FDA proposed 1/2 cup (4 fl oz) as the reference amount for the product category. The reference amount included the volume of coatings and wafers for the novelty type varieties.

80. Several comments recommended that FDA divide this category into two categories, one for bulk products and one for novelties. Some comments agreed with the 1/2-cup (4-fl oz) reference amount for bulk products. A few other comments asserted that the reference amount for bulk products should be larger. One comment suggested 6 oz, and another comment suggested 1 cup. Most comments recommended a 2.5-fl oz (an average size of 1 novelty) as the reference amount for novelties. The comments contended that novelty type products are consumed by piece, and the serving size should be 1 piece. The comments argued that the proposed reference amount of 4 fl oz would make the serving size 2 bars for some novelties packaged in multiserving containers.

First, FDA notes that food consumption data showed that the customarily consumed amount for novelty-type products was 2.5 oz. When converted to volume, 2.5 oz is equivalent to about 4 fl oz (Ref. 2). Bulk products and novelty-type products are the same type of products in different shapes. Some novelty-type products come without coating or wafers, and thus the bulk-type and the novelty-type differ only in shape. It is inappropriate to have two reference amounts for two forms of the same food that are used interchangeably. If FDA did have two separate reference amounts as suggested in the comments, one for bulk products (e.g., 4 fl oz) and one for novelty-type products (e.g., 2.5 fl oz), nutrition information and the evaluation for the qualification for claims for these two types of products would be based on different amounts. Consequently, although a bulk product might not be able to qualify for a claim, a similar novelty-type product might be able to do so because of the smaller reference amount. This result would be misleading.

Therefore, based on available consumption data, the agency has concluded that a uniform 1/2-cup reference amount is appropriate for both the bulk and the novelty-type products (Ref. 2). The 1/2-cup reference amount is also consistent with the reference amount for other desserts (e.g., custard, pudding, and gelatin desserts), which are often used interchangeably with products in this category as a dessert. The 1/2 cup reference amount is desirable for several other reasons: (1) It is in agreement with most serving sizes in dietary guidance documents, (2) it is consistent with the Canadian serving size guidelines, (3) it is the serving size currently used by many manufacturers, and (4) it was supported by many comments on the 1990 proposal.

The agency notes that new § 101.9(b)(2)(i) allows optional declaration of nutrition information on a single unit basis for products in discrete units that are more than 50 percent but less than 67 percent of the reference amount. Therefore, the serving size for most novelty-type products will be one unit.

For all the above reasons, FDA has retained the reference amount as proposed.

(26) Desserts: custard, gelatin or pudding

FDA proposed 1/2 cup as the reference amount for this product category.

81. Two comments opposed the proposed 1/2-cup reference amount. The comments argued that the powdered mix type of puddings comprised only about 52 percent of the retail food store sales of puddings in 1990. More recently, ready-to-eat puddings have taken the lead in terms of market share and are growing at a faster rate as compared to dry-mix type puddings. The comment stated that the reference amount should reflect the recent sales trend in puddings, or that FDA should establish a separate reference amount of 4 oz for ready-to-eat puddings. The comments contended that ready-to-eat puddings either come in 4 oz single-serving containers or in bulk containers that are multiples of 4 oz. Therefore, the customarily consumed amount of the ready-to-eat puddings is 4 oz. The comments argued that a volumetric measure is appropriate for dry pudding mixes but is inappropriate for ready-to-eat puddings.

FDA recognizes the recent trend in the availability of ready-to-eat puddings. However, the agency is not establishing separate reference amounts for different forms of the same food because the act directs the agency to establish uniform serving sizes. Therefore, it would be inconsistent with the act to have different reference amounts for different forms of the same food that are used interchangeably. The act also relates serving size to the amount of the food customarily consumed, not the form in which the food is sold. The comments did not present any food consumption data to prove that the amount of all forms of puddings customarily consumed is 4 oz, not 1/2 cup. The agency notes that sales data are not consumption data and do not necessarily equate to consumption data.

In addition, the agency points out that direct interpretation of the sales data often result in the wrong conclusion. For example, the comments compared sales data for ready-to-eat puddings and dry-mix type puddings on an as packaged basis. These two types of puddings cannot be compared directly on an as packaged basis because ready-to-eat puddings are in a prepared form, whereas dry-mix type puddings are not. Before these two types of products can be compared, they should be on an equal basis in weight, i.e., both types

should be on a prepared basis. FDA's independent analysis of the recent sales data showed that when the two types of products were compared on a prepared basis, dry-mix type puddings are still the major type of puddings in the marketplace, accounting for about 88 percent of the total prepared weight of all types of puddings sold (Ref. 51), as they were when the NFCS's were conducted. The results of this analysis reconfirmed that the 1/2 cup reference amount, which reflects the customarily consumed amount of the dry-mix type puddings, is still valid because the dry-mix type is still the major type of puddings used in the United States. Finally, the agency notes that according to new § 101.9(b)(2)(i), 4-oz containers of ready-to-eat puddings in the multiserving package are single-serving units, and under that section of the regulations, the serving size for the 4-oz container will be one container, i.e., 4 oz. Accordingly, FDA has retained the reference amount for puddings as proposed (1/2 cup).

(27) Egg and egg substitutes: egg mixture, e.g., egg foo young, scrambled egg, omelet

FDA proposed 110 g as the reference amount for this product category.

82. One comment contended that the reference amount for this category should be 100 g. The comment argued that it is inappropriate to add the weight of 2 eggs (100 g) and then an arbitrary amount of 10 g for the reference amount of egg mixtures. Another comment stated that the reference amount for an omelette should be related to the number of eggs used per omelette. For example, a "one egg omelette" should have a smaller reference amount than a "two egg omelette."

First, FDA points out that it did not arrive at the proposed reference amount by adding the weight of 2 eggs and then arbitrarily adding 10 g. According to the act, the serving size is an amount customarily consumed. The proposed reference amount represents the customarily consumed amount of the foods belonging to this category determined from food consumption data, following the procedures described in the 1991 serving size proposal (56 60394 at 60403) (Ref. 2). Secondly, the same food cannot have two different reference amounts, one for the egg mixture containing one egg and one for the egg mixture containing two eggs because, under the act, the reference amount is the amount of the food customarily consumed. These mixtures are used interchangeably. Therefore, FDA is establishing the same reference amount for both. Accordingly, FDA has not adopted these requests.

(28) Fats and oils: butter, margarine, oil, shortening

FDA proposed a uniform 1 tbsp. reference amount for this product category.

83. Comments on this reference amount were split fairly evenly for and against the proposed 1 tbsp. reference amount. Comments from the margarine and oil industry and a few others, including a consumer, supported the 1-tbsp. reference amount. Comments from the dairy industry and others, including a nutrition professional organization, opposed the proposed reference amount. Two comments recommended that FDA change the reference amount to 1 tsp. to be consistent with the serving size in the diabetic exchange list or to be consistent with dietary guidance recommendations which recommend lowering the total fat in the diet.

FDA has examined all arguments for and against the proposed uniform 1-tbsp. reference amount. FDA advises that it cannot change the reference amount to make it consistent with the serving size in the diabetic exchange list because, as explained in the 1991 serving size proposal (56 FR 60394 at 60407) and in section III.B. of this document, the serving size for the diabetic exchange list is designed to meet the needs of a special subgroup of the population having medical problems. It is not intended for the general public. As for the recommendation to change the reference amount to 1 tsp. to be consistent with the dietary guidance recommendations, FDA points out that the serving size on the product label is not the amount recommended for consumption. In section III.D.1. of this document, the agency has explained in detail why the serving sizes in the dietary guidance documents are not appropriate for nutrition labeling purposes. The agency also points out that food consumption data showed that 1 tsp. is not the customarily consumed amount of foods in this category. The amount customarily consumed for most products in this category is 1 tbsp. (Ref. 2). The comments to the 1991 serving size proposal merely reiterated the reasons stated in the comments on the 1990 proposal. No new arguments or data have been presented to persuade the agency to change the proposed uniform 1 tbsp. reference amount. Therefore, FDA finds no basis to change the reference amount, and it has retained the reference amount as proposed.

(29) Fats and oils: dressings for salad

FDA proposed 30 g as the reference amount for this product category.

84. Two comments suggested that FDA change the reference amount to 15 g (equivalent to 1 tbsp.). One comment argued that 30 g is too large and precludes dressings for salads "from claims where they would be considered as good sources of oils that would reduce serum cholesterol."

FDA advises that the serving size declared on the product label is by statute an amount customarily consumed. The amount customarily consumed for dressings for salad is 2 tbsp., not 1 tbsp. (Ref. 2). The agency cannot change a reference amount so that certain products can make a claim. Accordingly, FDA has retained the reference amount as proposed.

(30) Fish, shellfish, and meat or poultry substitutes: entrees (cooked) with sauce, e.g., fish with cream sauce, shrimp with lobster sauce

FDA proposed 140 g as the reference amount for this product category.

85. Two comments requested that FDA establish a uniform 85-g reference amount for all fish products with or without sauce. One comment contended that the proposed reference amount of 140 g is too high. The comment did not submit data to support this claim. The other comment contended that it will be difficult to categorize products into two categories, with and without sauce.

FDA advises that the serving size declared on the product label is, by statute, an amount customarily consumed. The amount customarily consumed for the products in this category (that is, with sauce) is 140 g, not 85 g (Ref. 2). No consumption data that would support a different reference amount were presented. The agency notes that it has provided an extensive list of products for each product category to assist manufacturers to locate the product category in which their specific products fit (Ref. 44). Accordingly, FDA has retained the reference amount as proposed.

(31) Fish, shellfish, and meat or poultry substitutes: entrees (cooked) without sauce, plain or fried fish and shellfish, fish and shellfish cake

FDA proposed 85 g as the reference amount for this product category. Many comments on the reference amount for this category specifically addressed the reference amount for meat and poultry products. FDA has forwarded these comments to USDA for consideration in the development of the final regulation for nutrition labeling of meat and

poultry products. The agency is responding to comments that included discussions on the reference amounts of FDA regulated products.

86. Comments from a nutrition professional organization and a nutrition professional supported the proposed 3-oz reference amount. However, FDA received a large number of comments from consumers stating that the 3-oz "serving size" is too small for "meat, poultry, and fish." These consumer comments did not state what the serving size for "meat, poultry, and fish" should be. (Although FDA does not regulate meat and poultry, the comments were responding to a prestructured questionnaire distributed by a consumer organization that discussed the serving sizes of meat, poultry, and fish together. Many other consumer comments that were not recorded on the prestructured questionnaire also stated that the 3-oz serving size is too small for meat and poultry, but they did not mention fish. Thus, the agency is not sure that the comments recorded on the questionnaire apply to the reference amount for fish. Therefore, the agency has presented the food names as they appeared in the questionnaire.) Two comments from consumer organizations requested that FDA establish two separate reference amounts for fish and shellfish. They suggested 1.4 or 1.5 oz for "shrimp" and 4 oz for fish based on the published data for the median consumed amount per eating occasion from the 1977–1978 NFCS. One industry comment requested that FDA create a new category for fish sticks with a reference amount of 70 g. The comment submitted data on the mean, percentiles, and modal consumed amounts from the 1987–1988 NFCS in support of the 70-g reference amount.

FDA has carefully examined all arguments against the 3-oz reference amount and the data submitted in support of the requested changes of the reference amount. FDA believes that comments from consumers indicated a misunderstanding of the meaning and purpose of the serving size on the product label. The serving size on the product label is not the amount recommended as the serving size for any individual. It represents an amount customarily consumed by the U.S. population that manufacturers are to use to present the nutrition information on their products. Therefore, the serving size on the product label may be too small or too large for some individuals. FDA plans to followup the publication of the nutrition labeling regulations with consumer education to assist consumers in using nutrition information on the label. Consumer education will include information on how nutrition information based on labeled serving size should be adjusted for the individual's own serving size.

As for the request for two separate categories for fish and shellfish, FDA finds that separate categories are inappropriate. As explained in the 1991 serving size proposal (56 FR 60394 at 60403), the agency grouped similar foods to determine reference amounts for product categories, not for specific foods. This grouping allows for product comparisons among similar foods that are likely to be used interchangeably. In determining the reference amount for this product category, fish and shellfish were grouped together because they are used interchangeably as entrees. Two separate reference amounts for fish and shellfish would undermine nutrition comparisons of these products that are used interchangeably in the diet. Although, if determined separately, the amount customarily consumed would be lower for shellfish than for fish (Ref. 41), it is also the case that the 1977–1978 NFCS and the 1987–1988 NFCS showed that about 40 to 50 percent of people consumed 3 oz or more shellfish per eating occasion, the amount of fish consumed per eating occasion by most people (Ref. 47). The two separate reference amounts suggested in the comment (1.5 oz for shellfish and 4 oz for fish) could also give a false message about the nutrient contents of fish and shrimp to the people who consume fish and shellfish in similar amounts. For example, shrimp is known to be high in cholesterol. On the same serving basis, shrimp is about three times as high in cholesterol as most finfish (Ref. 52). However, if shellfish has a serving size that is about one-third of the serving size for finfish as suggested in the comment, there will be little difference in the cholesterol content per serving. This information would be a disservice to the public, particularly to those consumers who have been told by their physician to limit their cholesterol intake. In addition, the agency points out that it is not using a reference amount that is derived solely from the 1977–1978 NFCS for the reasons stated in section III.D.1. of this document.

Therefore, to reduce consumer confusion and to promote uniform serving sizes for nutrition comparisons of products that are used interchangeably, the agency has concluded that fish and shellfish should have the same reference amount.

As for the request for a separate category for fish sticks, FDA advises that a separate category for fish sticks is not justified.

FDA's independent data analysis for fish sticks from the 1977–1978 NFCS and the 1987–1988 NFCS showed that the amount customarily consumed is 85 g, not 70 g (Ref. 41). Also, as discussed in section III.D.1. of this document, unless there is a good reason for relying solely on the 1987–1988 NFCS, FDA has used both the 1977–1988 NFCS and the 1987–1988 NFCS. Data submitted in the comment were based solely on the 1987–1988 NFCS without any explanation.

Having carefully examined all arguments and data submitted in the comments, FDA has concluded that the proposed 85-g reference amount is the amount of fish customarily consumed. Accordingly, the agency has retained the reference amount as proposed.

87. Proposed § 101.12(c) requires that the reference amount of uncooked seafood be the amount required to prepare 85 g of cooked seafood. A seafood trade association stated that they are very concerned that their members will be unable to determine the serving sizes for uncooked seafood needed to produce the reference amount. The comment contended that the amount of uncooked seafood required to make one reference amount is affected by many uncontrollable variables such as methods of cooking (e.g., frying in oil or conventional and microwave cooking) and cooking time. The comment asserted that given these uncertainties, the serving size should be based on an "as packaged" basis for processed foods that require no further preparation other than cooking.

FDA recognizes the variability in cooking methods and time used to prepare seafoods. The agency agrees that this variability makes it difficult to determine the serving size of the uncooked seafood. Therefore, the agency has concluded that it should establish a reference amount for uncooked seafoods except for those fish and shellfish that are allowed to provide nutrition information on a cooked basis in new § 101.9(j)(11) and § 101.45. Using USDA's cooking yield information (Ref. 18), FDA has estimated the reference amount for uncooked fish and shellfish as 110 g (Ref. 53). Accordingly, the description "(cooked)" has been deleted from the product category name and the reference amount has been changed to read: "85 g cooked; 110 g uncooked." A footnote has been added to inform manufacturers that the 110 g uncooked reference amount does not apply to the raw fish and shellfish subject to § 101.45 and packaged single-ingredient fish and shellfish in new § 101.9(j)(11).

(32) Fish, shellfish, and meat or poultry substitutes: fish and shellfish, canned

FDA proposed 85 g as the reference amount for this product category.

88. Two comments opposed the proposed reference amount. One comment from a trade association contended that the category should be divided into subgroups with separate reference amounts: 56 g for canned tuna and bonito and 100 g for canned salmon. The comment contended that these reference amounts are more consistent with the current industry practices and equal to the contents of single-serving containers on the market. A comment from a seafood trade association requested that FDA change the reference amount to 55 g to make it consistent with the reference amount for luncheon meats. The comment submitted data showing that the largest use of tuna is as an ingredient in sandwiches.

FDA advises that it cannot change the reference amount simply to make it consistent with current industry practices or to make it equal to the contents of single-serving containers on the market. The agency's review of the data submitted in the comment showed that the major usage of tuna is as an ingredient in sandwiches. One of the general principles in determining the reference amount in new § 101.12(a)(7) states that the reference amount should reflect the major usage of the food. In the United States, more tuna is consumed than other canned fish (Ref. 47), and its major use is as an ingredient in sandwiches. The amount of the sandwich cutomarily consumed is one sandwich, and about 2 oz tuna (on a drained weight basis) is used to make one sandwich (Ref. 47). Thus, the agency has concluded that the reference amount for canned fish should be changed to 55 g to reflect the use as an ingredient in sandwiches. The 85-g reference amount proposed in the 1991 serving size proposal was based on all uses of tuna and other canned fish, including their use as an entree and for fish salad.

Accordingly, FDA has revised the reference amount to 55 g.

(33) Fish, shellfish, and meat or poultry substitutes: smoked or pickled fish or shellfish

FDA proposed 55 g as the reference amount for this product category.

89. A comment from a seafood trade association stated that smoked/pickled fish are specialty foods consumed as appetizers, not as a "center-of-the-plate item." Therefore, the comment said, the reference amount should be closer to the reference amount for snacks (30 g). The comment did not submit any data to support the 30 g reference amount that it recommended.

FDA advises that food consumption data did not support a 30-g reference amount. The 55-g proposed reference amount reflects the amount customarily consumed for smoked or pickled fish or shellfish (Ref. 2). Accordingly, FDA has retained the reference amount as proposed.

(34) Fruits and fruit juice: dried

FDA proposed 40 g as the reference amount for this product category.

90. A comment from a Federal agency recommended that FDA change the reference amount to 30 g. The comment contended that the proposed reference amount is too large for some dried fruit (e.g., dried apple rings, dried apricots).

FDA advises that the serving size declared on the product label is, by statute, an amount customarily consumed. Food consumption data showed that the amount customarily consumed for the products in this category is 40 g, not 30 g (Ref. 2). The comment did not present any data to support that 30 g better reflects the customarily consumed amounts of products in this category. Accordingly, FDA has retained the reference amount as proposed.

(35) Fruits and fruit juice: fruits used primarily as ingredients, e.g., avocado, cranberries, lemon, lime

FDA proposed 55 g as the reference amount for the product category.

91. One comment from a Federal Government agency opposed the 55 g reference amount. The comment stated that the proposed reference amount is too large, but the comment did not suggest what the reference amount should be. A comment from a trade association for avocadoes requested that FDA change the reference amount of avocados to 1 oz. The comment contended that USDA's g weight conversions (conversion factors) of small, medium, and large avocados were too high and did not reflect the California avocados which account for over 90 percent of the total U.S. avocado crop. In addition, the percent yield values used to determine the edible portion of avocados in the NFCS were too high. The comment submitted corrected conversion factors from a "National Retail Weight Study" sponsored by a trade association, an extensive list of the updated percent yield values, and results of a reanalysis of the NFCS data using the corrected conversion factors and the updated percent yield values. The data supported a 1-oz reference amount rather than 2 oz.

FDA carefully examined all of the data submitted in the comment. The results of the "National Retail Weight Study" showed that the conversion factors for small, medium, and large avocados were considerably lower than the values used in the NFCS. The updated percent yield values for 200 avocados of three California avocado varieties were significantly lower than the yield values used in the NFCS. The results of the comment's reanalysis of the 1987–1988 NFCS data using corrected conversion factors, and the updated percent yield values showed that the mean was about 2 oz, the median was about 1 oz, and the primary mode, that which accounted for over 50 percent of the total number of eatings, was 1 oz. The data submitted in the comment clearly showed that the customarily consumed amount is closer to 1 oz than to 2 oz. Because data from the 1987–1988 NFCS showed a decreasing trend in the amount of avocado consumed since the 1977–1978 NFCS, and the trend was confirmed by the CSFII (Ref. 40), the agency is relying on the data from the 1987–1988 NFCS submitted in the comment. Therefore, the agency has concluded that avocados should have a separate category with a reference amount of 30 g. Accordingly, FDA has divided the "Fruits used primarily as ingredients * * *" category into two categories: "Fruits used primarily as ingredients, avocado" with a reference amount of 30 g and "Fruits used primarily as ingredients, others (cranberries, lemon, and lime)" with a reference amount of 55 g as proposed.

(36) Fruits and fruit juice: all other fruits (except those listed as separate categories), fresh, canned or frozen

FDA proposed 140 g as the reference amount for this product category.

92. Several comments from the industry stated that the 140-g reference amount (equivalent to 5 oz) is too large. The comments requested that FDA change the reference amount to the g-equivalent of 1/2 cup.

FDA advises that it cannot use the g-equivalent of the 1/2 cup measure as the reference amount for two reasons: (1) For fruits that can be measured with a cup (e.g., canned or frozen fruits), food consumption data showed that the amount customarily consumed is about 5 oz, not 1/2 cup (Ref. 2), and (2) for the fruits that cannot be measured with a cup (e.g., most fresh fruits), the g-equivalent for the 1/2 cup measure cannot be determined. Food consumption data showed that the amount of fresh fruits is also about 5 oz

(Ref. 2). Accordingly, FDA has retained the reference amount as proposed.

(37) Fruits and fruit juice: juice, nectar, fruit drinks, or fruit-flavored drinks

FDA proposed 240 mL (8 fl oz) as the reference amount for the product category.

93. Comments from several manufacturers and trade associations (including a juice manufacturer and trade associations for juices) and a comment from a nutrition professional organization supported the proposed uniform 8-fl oz reference amount for all beverages. Comments from two other trade associations requested that FDA change the reference amount for juices to 6 fl oz. One comment stated that 6 fl oz is the amount that represents long established industry practice, and that 6 fl oz is a more appropriate reference amount when extended to multiserving containers. The comment submitted no data to support its claims, however. A manufacturer contended that FDA has no authority to manipulate the customarily consumed amount of food in order to standardize the reference amount. The comment argued that FDA's own data from the 1977–1978 NFCS (Ref. 2) indicated that 4 fl oz is the amount customarily consumed, and therefore, FDA must change the reference amount to 4 fl oz. A consumer asserted that 250 mL (8.45 fl oz) is a more appropriate reference amount because most small size juices are sold in 250 mL packs.

The agency notes that data from the 1977–1978 NFCS suggested 6 fl oz (not 4 fl oz as claimed by one comment) to be the customarily consumed amount. The agency notes that the comment that asserted that 4 fl oz is the amount customarily consumed misread the data. Data from the 1977–1978 NFCS had a mean of 6.3 fl oz, the median of 6 fl oz and 3 modes (4 fl oz, 6 fl oz, 8 fl oz). However, data from the 1987–1988 NFCS suggested that 8 fl oz is the customarily consumed amount for juices. Also, both the 1977–1978 NFCS and the 1987–1988 NFCS showed that 8 fl oz is the customarily consumed amount for fruit juice drinks and fruit-flavored drinks that are used interchangeably with fruit juices. Therefore, the agency has concluded that 8 fl oz is the most reasonable reference amount for all fruit juices and drinks.

As for the consumer comment, the agency advises that food consumption data did not support a 250-mL reference amount. The agency notes that the 250 mL packs of juice are single-serving containers and, therefore, will be labeled as 1 serving.

Considering the weight of support for the uniform 8 fl oz reference amount for all beverages and for the other reasons stated above, the agency has concluded that 8 fl oz is the appropriate reference amount under section 403(q)(1)(A)(i) of the act for all beverages including fruit juices and fruit drinks. The uniform reference amount for all beverages facilitates nutrition comparisons of different beverages. Accordingly, FDA has retained the reference amount as proposed.

(38) Legumes: bean cake (tofu)

FDA proposed 85 g as the reference amount for the product category.

94. A comment from a consumer organization stated that, because the sample size for tofu in the 1977–1978 NFCS was so small (n=12), an accurate estimate of the amount customarily consumed could not be derived from this survey. The comment contended that because tofu is used as a substitute for meat and poultry, the reference amount should be equivalent to the reference amount for meat and poultry.

FDA agrees that the sample size for tofu in the 1977–1978 NFCS was too small to give a reliable estimate of the amount customarily consumed. However, for other reasons explained in section III.D.1. of this document, the agency is not using a reference amount that is based solely on the 1977–1978 NFCS. The 1987–1988 NFCS had a larger sample size for tofu (n=31), and all three statistical values from the 1987–1988 NFCS data that FDA uses in determining the amount customarily consumed (the mean, the median, and the mode) showed that 3 oz is the amount of tofu customarily consumed (Ref. 2). Therefore, the agency has concluded that 3 oz is a reasonable reference amount for tofu. The 3 oz reference amount is the same as the reference amount for fish, shellfish, game meats, and meat or poultry substitutes without sauce regulated by FDA and the reference amount for meat and poultry regulated by USDA. Accordingly, FDA has retained the reference amount as proposed.

(39) Legumes: beans, plain or in sauce

FDA proposed 1/2 cup as the reference amount for the product category.

95. Two comments, from a trade association and a manufacturer, supported the proposed 1/2-cup reference amount. However, the comments requested that FDA change the 1/2 cup reference amount to a g weight. One comment opposed the use of drained weight for plain canned beans. The comment contended that nutrition information on the canned beans should be based on an as packaged basis, including the liquid.

In light of the difficulty in determining the g weight of the household measure, FDA has concluded in section III.D.2. of this document that volume-based reference amounts should be converted to weight-based reference amounts where a weight-based reference amount is feasible. The agency has reexamined foods in this product category and has concluded that the weight-based reference amount can be determined for this category. By taking the average of the g weights per 1/2 cup of cooked plain beans reported by USDA (Ref. 54), the agency has determined that the reference amount for beans that are not canned in liquid or in sauce to be 90 g (Ref. 55).

Regarding the comment that requested nutrition information of canned beans on an as packaged basis, including the liquid, the agency, as discussed in section III.H.2. of this document, has concluded that the nutrition information of canned beans will be based on an as packaged basis including the liquid because a large percentage of people do use the liquid in the canned food. By taking the average of the g weights per 1/2 cup of canned beans including the liquid reported by USDA (Ref. 54), the agency has determined that the reference amount for canned beans, including the liquid, is 130 g (Ref. 55). Also, by taking the average of the g weights per 1/2 cup of beans with sauce (e.g., pork and beans, baked beans) reported by USDA (Ref. 54), the agency has determined that the reference amount for beans in sauce is 130 g (Ref. 55).

Accordingly, FDA has revised the reference amount to read: "130 g for beans in sauce or canned in liquid; 90 g for others."

(40) Miscellaneous category: batter mixes, bread crumbs, meat, poultry, and fish coating mixes, dry

FDA proposed 30 g as the reference amount for this product category.

96. An industry comment opposed the 30 g reference amount for coating mixes. The comment stated that because of the varying densities of the products and the varying surface areas of the products they coat (e.g., meat and fish), 30 g of coating mix will coat between 3 and 8 oz of meat. The industry suggested including coating mixes with seasoning mixes with a reference amount equal to the amount of the product required to prepare one portion of the end product (e.g., the amount necessary to coat 3 oz of meat or fish).

FDA recognizes that coating mixes vary in density, and that the amount needed to coat the surface areas depends on the type of the mixes and the products they coat. These products are made for use in a specific end dish (e.g., coating mix for fish). Thus, a reference amount that is the amount required to prepare one reference amount of the end product would be more consistent with the amount customarily consumed of coating mixes.

Therefore, the agency has concluded that the reference amount for coating mixes should be changed to the amount to make one reference amount of the final dish as listed in new § 101.12(b). In the case of multiple uses, manufacturers should determine the major use of the coating mix based on food consumption data, marketing survey data on the consumer usage of the product, or in the case of a new product, promoted use, and use that major use to determine the reference amount. The agency agrees that coating mixes should be grouped with seasoning mixes because they are a type of seasoning mixes. Accordingly, FDA has revised the seasoning mixes category to read: "Meat, poultry and fish coating mixes, dry; seasoning mixes, dry, e.g., chili seasoning mixes, pasta salad seasoning mixes."

(41) Miscellaneous category: chewing gum

FDA proposed 3 g as the reference amount for the product category.

97. Two comments from the chewing gum industry stated that the reference amount for chewing gum should be one piece because, according to a recent marketing research study, people consume chewing gum piece by piece, not by weight. The comment contended that because chewing gum products vary so widely in the piece size, it is not possible to fix a standard weight that adequately encompasses the serving size. The comment also argued that much of the chewing gum consumed weighs less than 2 g per piece. Another comment argued that a 3 g reference amount is too small because it corresponds to 3/4 stick or 1 7/8 chiclets. The comment requested that FDA change the reference amount to 4 g.

FDA agrees that chewing gums vary widely in the piece size, and that chewing gums are usually consumed by piece. However, the agency cannot use one piece as the reference amount. Some chewing gums come in very small pieces (mini-size chewing gums weighing about 1 g per 10 to 12 pieces), and people usually chew several pieces at a time. Therefore, it is not appropriate to call one piece of these mini-size chewing gums a serving. The reference amount is needed to determine the serving size of these mini-size chewing gums.

As explained in section III.D.5.a. of this document, for compliance monitoring, the agency also needs a fixed value as the reference amount, not a measure that varies from brand to brand (e.g., piece). The wide variability in the piece size makes the determination of the reference amount difficult. Based on the piece size of the chewing gums commonly available in the Washington, DC metropolitan area, the agency has determined 3 g to be a reasonable reference amount (Ref. 2). The agency acknowledges that there are some chewing gums that weigh less than 2 g per piece. The new lower limit for the single-serving unit in new § 101.9(b)(2)(i), however, will make all chewing gums that weigh more than 1.5 g per piece one serving.

The agency also recognizes that there are many chewing gums that weigh more than 200 percent of the reference amount. Although they weigh more than the upper limit of the single-serving unit, marketing data submitted in the comment show that gums are intended to be single-serving products. Therefore, footnote 9 of Table 2 informs the manufacturer that the serving sizes of all chewing gums that weigh more than 3 g, that can reasonably be consumed at a single-eating occasion, is 1 piece.

As for the comment that recommended the 4-g reference amount, a 4-g reference amount would make the serving sizes of all chewing gums weighing 2 g or less, 2 or more pieces. Chewing gums, with the exception of the mini-size chewing gums, are customarily consumed one piece per eating occasion. In light of the many chewing gums weighing less than 2 g per piece mentioned in the comment, the agency has concluded that a 4 g reference amount is too large. The agency also notes that FDA's measurements showed that commonly available chewing gums weigh about 3 g per stick (Ref. 2).

Accordingly, FDA has retained the 3-g reference amount as proposed.

(42) Miscellaneous category: salad and potato toppers, e.g., salad crunchies, salad crispins, substitutes for bacon bits

FDA proposed 7 g as the reference amount for the product category.

98. One comment opposed the proposed reference amount. The comment recommended that FDA change the reference amount to 5 g (approximately 2 tsp.). The comment contended that a 5-g reference amount is supported by "consumer-based consumption data" collected by the comment. The comment submitted no data, however, to support this claim.

FDA advises that food consumption data showed that the customarily consumed amount for products in this category is 7 g (Ref. 2). The 7 g reference amount also approximates 1 tbsp., a convenient household measure, and is consistent with the reference amount for croutons that are used as a salad topper. The comment did not submit any data. Thus, there is no basis for the agency to change the reference amount to 5 g. Accordingly, FDA has retained the reference amount for this category as proposed.

(43) Miscellaneous category: salt, salt substitute, seasoning salt (e.g., garlic salt)

FDA proposed 1 g as the reference amount for this product category.

99. One comment agreed with the proposed reference amount because it is in the best interest of the consumers. A comment from a trade association for spice products agreed with the proposed reference amount of 1 g for seasoning salts. However, the comment requested that FDA allow manufacturers to voluntarily declare the sodium content per 1/4 tsp. Another comment objected to the weight-based reference amount. The comment contended that it had developed a low-density salt product that provides a salt taste similar to that of regular salt in a smaller g amount, because the low-density salt is processed to dissolve faster and more completely than the regular salt. Because the low-density salt weighs significantly less than salt, a weight-based reference amount (e.g., 1 g) would result in a serving size of the low-density salt 2 1/2 to 3 times larger than that of salt. Therefore, the comment requested that FDA change the reference amount to a volume-based reference amount (e.g., 1/4 tsp.). The comment did not submit any data to support that regular salt and the low-density salt are consumed equally on a volume basis.

FDA advises that the reference amount for sugar substitutes is "an amount equivalent to one reference amount for sugar in sweetness." Both sugar and salt are used as flavoring agents. People use them to attain the level of sweetness or saltiness that they desire. Therefore, like sugar the reference amount for a salt substitute (e.g., low-density salt) should be the amount necessary to provide a salty taste equivalent to one reference amount of salt. Salt is used both in cooking and at the table. Although regular salt may not completely dissolve when added at

the table, it will dissolve completely when used in cooking. Because, as the name indicates, the low-density salt is lighter than the regular salt, 1/4 tsp. of the low-density salt will contain less salt than 1/4 tsp. of the regular salt. Therefore, when used in cooking, a larger volume of the low-density salt than the regular salt will be required to achieve the same salty taste. Thus, low-density salt and regular salt may not be used on an equal volume basis at least in cooking. Accordingly, the agency rejects the request for a volume-based reference amount.

100. A comment from a consumer organization stated that the reference amount should be expressed as 1,000 milligrams (mg), instead of 1 g, to be consistent with the sodium content listed in the nutrition information panel. The comment contended that most Americans are unfamiliar with the metric system, so they will not understand that 1 g is equal to 1,000 mg.

FDA does not agree with the comment. Whether the reference amount is expressed 1 g or 1,000 mg, the serving size on the product label by statute has to be in a common household measure (e.g., 1/4 tsp.). The nutrition information on the label tells consumers how much sodium is in one serving (1/4 tsp.) of salt. It is not necessary for consumers to know that 1 g equals 1,000 mg to use the nutrition information on the product label. Therefore, the agency has concluded that it is not necessary to change the reference amount to 1,000 mg.

(44) Mixed dishes: measurable with cup, e.g., casserole, hash, macaroni and cheese, pot pie, spaghetti with sauce, stew, etc

FDA proposed 1 cup as the reference amount for the product category.

101. Many comments agreed with the proposed reference amount. One manufacturer agreed with the 1-cup reference amount for mixed dishes that are served as main dishes. However, the comment contended that 1/2 cup is a more appropriate reference amount for mixed dishes that are served as side dishes (e.g., potato dishes, pasta salad, potato salad). The comment contended that the 1987–1988 NFCS supported the 1/2-cup reference amount for these products. The comment did not submit data to support this claim.

FDA advises that pasta salad and potato salad have a separate category under Salads with a reference amount of 140 g which is equivalent to about 3/4 cup. Because the comment did not submit data to support the 1/2-cup recommendation, the agency is unable to verify the 1/2-cup reference amount claimed by the comment for the mixed dishes that belong to this product category. However, the agency notes that both the 1977–1978 NFCS and the 1987–1988 NFCS showed that the customarily consumed amount for products that belong to the "Mixed dishes measurable with cup" category is 1 cup, not 1/2 cup (Ref. 2). The agency recognizes that mixed dishes are used for both a main dish and a side dish. However, FDA rejects the suggestion to establish two different reference amounts for the same type of food for three reasons. First, one of the uses of the reference amount is to determine the appropriateness of nutrient content and health claims made on food products. Such a determination cannot be made for the same food on two or more different bases (i.e., reference amounts), e.g., a smaller reference amount (1/2 cup) to evaluate a claim for a side dish and a larger reference amount (1 cup) to evaluate a similar claim on a similar product labeled as a main dish.

Secondly, there is no assurance that a product labeled as a side dish will not be consumed as a main dish, and vice versa. Thirdly, this suggestion is not in the best interest of the consumers. Two reference amounts for the same type of products will interfere with the goal that there be uniformity among serving sizes declared on similar products by different manufacturers.

In the 1991 serving size proposal (56 FR 60394 at 60402), the agency stated that it would not object to manufacturers providing a second column of nutrition information as a side dish or as a main dish. The agency advises that the second column of information is allowed only if the serving size as a side dish or as a main dish meets the requirement for the second column in new § 101.9(b)(11), i.e., if the serving size for the second column differs from the serving size for the required column by at least two fold. However, the agency wants to make it clear that it will use the appropriate reference amount in new § 101.12(b) to evaluate whether a mixed dish that does not qualify as a meal product or a main dish product as defined in new § 101.13(l) and (m) meets FDA standards for any claim made for the product.

102. Several comments requested that FDA use a weight-based reference amount or include g weight equivalent of 1 cup in the reference amount (e.g., 1 cup (235 g)). One manufacturer suggested a 7.5 oz reference amount. Another manufacturer requested that the same reference amount be used for canned mixed dishes and frozen mixed dishes and suggested a 7.5-oz reference amount.

Although mixed dishes measurable with a cup are consumed in similar quantities by volume (e.g., 1 cup), it is not possible to have one uniform g-weight equivalent reference amount (e.g., 235 g) or weight-based reference amount (e.g., 7.5 oz) because mixed dishes come in many different forms and combinations of ingredients. Therefore, the g-weight-per-cup measure will vary greatly for different dishes. Accordingly FDA has retained the volume-based reference amount.

With regard to the comment that recommended that the same reference amount be used for both canned and frozen mixed dishes, FDA advises that although the reference amounts in new § 101.12(b) are expressed in the prepared ready-to-eat weight, they apply to all forms of the products in the product category: Dry, canned, frozen, refrigerated, and ready-to-eat. Therefore, both canned and frozen (fully-cooked "heat and serve") mixed dishes have the same reference amount. The reference amount for uncooked frozen mixed dishes would be the amount of such a product necessary to prepare one reference amount established in new § 101.12(b).

103. A manufacturer requested that FDA use a uniform 6-oz (170 g) reference amount for both mixed dishes measurable with a cup and mixed dishes not measurable with a cup to provide more continuity and consistency in reference amounts for products that qualify as "meal-type" products.

FDA advises that the serving size on the product label is, by statute, an amount customarily consumed. Both the 1977–1978 NFCS and the 1987–1988 NFCS showed that the amounts customarily consumed for the mixed dishes measurable with a cup and the mixed dishes not measurable with a cup differ considerably (Ref. 2). Therefore, it is not possible to have a uniform reference amount that reflects the amount customarily consumed for the two categories. Accordingly, the agency rejects this request.

104. One comment recommended that FDA delete seasoned flavored rice mixes from this category and include it in the rice category. The comment contended that flavored rice mixes differ from all other products in the mixed dishes category, which all contain two or more components from at least two different food groups. Rice mixes contain only rice and seasoning.

FDA agrees with the comment that many flavored rice mixes are mixtures of rice and seasoning. However, some varieties do contain two or more components from two or more food

groups. For example, dry spanish rice mix contains rice and tomato. Also, seasoned flavored rice comes both canned and in dry mixes. The canned flavored rice (e.g., canned spanish rice) contains a large amount of tomato.

The agency included seasoned flavored rice mixes in the Mixed dishes measurable with cup category instead of the plain rice category for the following reasons: First, the amount of seasoned flavored rice customarily consumed was generally higher in g than that of plain rice (Ref. 2), and therefore, the 140 g reference amount for the plain rice was not appropriate for seasoned flavored rice.

Secondly, "seasoned flavored rice" includes a diverse variety of rice products. Some are clearly mixed dishes and others are not. Because the customarily consumed amount in volume of seasoned flavored rice (1 cup) was similar to that of other products in the "Mixed dishes measurable with cup" category (1 cup), the agency included all seasoned flavored rice in the "Mixed dishes measurable with cup" category in the proposal.

FDA concludes that seasoned flavored rice fits best in the "Mixed dishes measurable with cup" category because the amount customarily consumed is the same for both of these products. Accordingly, the agency rejects the request.

(45) Mixed dishes: not measurable with cup, e.g., burrito, egg roll, enchilada, pizza, pizza roll, quiche, all types of sandwiches

FDA proposed 140 g for pizza and products without sauce and 195 g for products topped with sauce as the reference amounts for the product category.

105. Some manufacturers contended that unlike other products included in this category that are consumed as a main dish (e.g., burritos, enchiladas, sandwiches, and pizza), pizza rolls and egg rolls are not customarily consumed as the main part of a meal, and thus pizza rolls and egg rolls should not be classified as a mixed dish not measurable with a cup. The comments asserted that these products are designed and promoted as snacks. The comments recommended that FDA either include pizza rolls and egg rolls in the category "Entrees without sauce" or create a separate category for appetizers with a reference amount of 85 g. Another manufacturer agreed with the 5-oz reference amount for pizza as a meal, and they also agreed that the claim evaluation should be based on the 5-oz reference amount. However, the comment requested that FDA establish a separate reference amount (e.g., 70 g) for presenting the nutrition information when pizza is used as a snack. The comment stated that the manufacturer should have the right to decide if the product is a meal or a snack.

FDA advises that the "Entrees without sauce" category under the major category for Fish, Shellfish, Game Meat, or Meat or Poultry Substitutes includes products whose major ingredients are fish, shellfish, game meat, or meat or poultry substitutes such as plain or fried fish and shellfish, fish and shellfish cake, and meatless hamburger. Pizza rolls and egg rolls do not belong to the "Entrees without sauce" category because the major ingredients of these rolls are not fish, shellfish, game meat, or meat or poultry substitutes. The NFCS included pizza rolls and egg rolls in the same group as pizza which is classified as mixed dishes not measurable with cup in § 101.12(b). Therefore, the agency has concluded that pizza rolls and egg rolls belong to the category of mixed dishes not measurable with cup.

With regard to a separate category for pizza rolls and egg rolls as appetizers, FDA finds no basis to justify a separate category. As explained in the 1991 serving size proposal (56 FR 60394 at 60403), the agency grouped similar foods to determine reference amounts for product categories, not specific foods. This grouping allows for product comparisons among similar foods that are likely to be used interchangeably. The agency included pizza rolls and egg rolls in the category for mixed dishes not measurable with cup because they are frequently used interchangeably with other products in this category as entrees. Although pizza rolls and egg rolls may be promoted as a snack or appetizer, and the amount of these rolls customarily consumed may be smaller than the amount customarily consumed for other products in the mixed dishes not measurable with cup category (e.g., pizza) that are used primarily as an entree, food consumption data show that a large percentage of people consumed 4.5 to 9 oz (Ref. 47) of pizza rolls or egg rolls per eating occasion, which are amounts that are appropriate for use as an entree, not an appetizer. To promote uniform serving sizes for nutrition comparisons of products that are used interchangeably, FDA has concluded that pizza rolls and egg rolls should have the same reference amount as other products in the mixed dishes not measurable with cup category. Accordingly, FDA rejects this request.

106. A consumer organization contended that the reference amount for pizza should be 7 oz. The comment stated that the 5-oz reference amount is too small because: (1) The average weight of single-serving pizzas in supermarkets is 6.6 oz, (2) two slices of pizza at a popular pizza restaurant averages 7.3 to 7.4 oz, and (3) a personal pan pizza served at a popular pizza restaurant is 9 oz. The comment also argued that the reference amount for vegetable burgers should be 7 oz because the average weight of hamburgers in fast-food restaurants is 7 oz. The comment contended that the "serving size" should reflect what is commonly consumed at fast food restaurants as well as at home.

FDA advises that all sizes of pizzas mentioned in the comment will be one serving based on the 5-oz reference amount and the single-serving container definition in § 101.9(b)(6). There is no need to change the reference amount which is based on consumption data, not the weight of products on the market (Ref. 2).

As explained in section III.D.5.a. of this document, FDA included the pizza and hamburger consumed at the fast food restaurants in arriving at the 5-oz reference amount. Therefore, there is no need to change the reference amount to reflect the amount consumed at fast food restaurants.

Accordingly, FDA has retained the reference amount as proposed.

(46) Nuts and seeds: nuts, seeds and mixtures

FDA proposed 40 g as the reference amount for the product category.

107. Many comments were received from the nut industry requesting that FDA change the proposed reference amount to 1 oz or 28 g or 30 g. The comments contended that nuts are used interchangeably with snacks and thus should have the same reference amount as snacks to facilitate nutrition comparisons of different types of snacks. The comments argued that 1 oz is the historical serving size, and airline single-serving packets are less than 1.5 oz. Many of these comments stated that a research study conducted by a consulting firm on the comments' behalf uncovered a series of potential biases built into the protocol for using consumption data for the purposes of determining a reference amount. The comments claimed that many of the g-weight equivalents of cup measures in the NFCS data base used to convert the cup measures of nuts to the g weights were too high. Consequently, the g amounts reported in the NFCS that FDA used to estimate the reference amount for the nut category were overestimated. The comments contended that reanalysis of the NFCS data, using their

own "correct" g-weight equivalents per cup measures, showed that 1 oz is closer to the customarily consumed amount than 1.5 oz. Some comments submitted the g-weight equivalents of cup measures used in the reanalysis and detailed descriptions and data from the reanalysis. Other biases in determining the reference amounts for nuts described in the comments included: (1) FDA's analysis did not include all food codes in the nuts and seeds category, and (2) FDA used mean weights that were between two modal values when one modal value was twice as large as the other.

One comment contended that estimates of nut consumption from the NFCS are not accurate because the amounts consumed were reported in an approximate measure (e.g., cups). To obtain more accurate estimates of the consumption, the comment conducted an independent "in-home usage" survey in 20 cities across the United States, using a diary method in which the respondents recorded the number of nuts that they consumed at each eating occasion. The survey tested four different nuts commonly consumed in the United States and included 568 households. The survey was designed to parallel, as closely as possible, the demographic and socioeconomic characteristics of the nut users in the United States. The comments contended that the results of this survey showed that the amount of nuts customarily consumed is 1 oz, not 1.5 oz. The comment submitted detailed descriptions of the survey methodology and the methodology for the sample selection and the determination of the number of nuts per oz, and detailed data.

FDA carefully examined all arguments and data submitted in the comments. In the absence of well-established procedures, the agency acknowledges that NFCS data may have inaccuracies, as data from food consumption surveys usually do. The agency also recognizes the difficulties in determining the g-weight equivalents of cup measures of solid foods such as nuts. However, the agency advises that the comments' own reanalysis of the NFCS data using the comments' own estimates of the g-weight equivalents of cup measures did not give any better estimates of the nut consumption. The comments' reanalysis of the NFCS underestimated the nut consumption reported in the NFCS because the technique used to determine the g-weight equivalent of cup measures did not measure a volume of nuts equivalent to 1 cup as defined in new § 101.9(b)(5)(iv), i.e., 240 mL (Ref. 47). Therefore, FDA cannot use the results of the reanalysis of the 1987–1988 NFCS submitted by the many comments.

However, the agency agrees that the methodology used in the independent "in-home usage" survey (counting the number of nuts) estimated the nut consumption more accurately than the NFCS. The survey also had a much larger sample size (number of individual eating occasions) than the NFCS. The survey's sample size was 8 times as large as that in the 1987–1988 NFCS. The methodology used to determine the number of nuts per oz that was then used to convert the number of nuts consumed to g weight was sound. Data from this survey showed that the amount of nuts customarily consumed is closer to 1 oz than 1.5 oz. Accordingly, FDA has revised the reference amount to 1 oz.

FDA does not agree that FDA's estimate of the customarily consumed amount for nuts was biased because the analysis did not include all food codes in the nuts and seeds category. To facilitate data analysis given severe time constraints, FDA, in some cases, selected foods having a high frequency of consumption to represent the category instead of using all foods appropriate for the category. In response to a similar comment on the 1990 proposal, the agency presented evidence that inclusion or exclusion of infrequently consumed food did not affect the determination of the amount customarily consumed (Ref. 19). In response to the above comment on the 1991 serving size proposal, FDA reanalyzed the data analysis including all food codes for nuts, seeds and mixtures (excluding boiled peanuts which the comment said was inappropriate), and the results showed that the inclusion of all food codes did not make a significant difference (Ref. 41).

With regard to the comment that stated that FDA's estimate of the customarily consumed amount for nuts is inappropriate because it used mean weights that were between two modal values, the agency advises that the comment misinterpreted the way FDA derived the reference amount from the survey data. When the sample sizes were adequate, but the three statistical estimates that represent an amount customarily consumed (mean, median, and mode) did not agree, the agency considered all three values in deciding the reference amount (56 FR 60394 at 60405). Nuts had adequate sample size, but the three values differed. Therefore, the agency considered all three values to determine the reference amount for nuts. When all three values were considered together, 1.5 oz was determined to be the customarily consumed amount which happened to be closer to the mean value than to either of the two modes. The agency did not arbitrarily take the mean weights that were between two modal values.

After a careful examination of all arguments and data submitted in the comments and for the reasons explained above, FDA has concluded that the amount of nuts customarily consumed is 1 oz. Therefore, the agency has revised the reference amount for nuts to 30 g (equivalent to 1 oz).

(47) Nuts and seeds: nut and seed butter, paste, or cream

FDA proposed 30 g as the reference amount for this product category.

108. A manufacturer pointed out that several new product developments within the peanut butter market, of which FDA was not likely aware during the development of the 1991 serving size proposal, have resulted in a range of product densities among existing products. The comment stated that consumers eat peanut butter according to volume. The comment contended that the weight-based reference amount makes the serving size for whipped butter 3 tbsp., instead of 2 tbsp. Therefore, the proposed weight-based reference amount would severely undermine manufacturers' incentive to produce a peanut butter lower in fat. The comment pointed out that when products within the product category differ widely in density, FDA expressed the reference amount in volume, not in weight. The comment contended that because the densities of different brands of peanut butter differ widely, FDA should express the reference amount for peanut butter in volume, not in weight. The comment, therefore, requested that FDA change the reference amount to a volume-based reference amount (e.g., 2 tbsp.). The comment submitted data showing the differences in the densities of the regular and whipped peanut butter.

FDA acknowledges that it was not aware of the new line of whipped peanut butter during the deliberation of the 1991 serving size proposal. The agency also agrees that it has expressed the reference amount in volume, not in weight, when the density of the products within the product category vary widely and the amount customarily consumed is more uniform in volume. The agency also acknowledges that commonly used cookbooks show that peanut butter is used by volume (e.g., tbsp. and cups), not by weight (Refs. 43 and 44). Therefore, the agency has concluded that the reference amount for

peanut butter should be changed to a volume-based reference amount to encompass the differing densities of the different brands of peanut butter. Accordingly, FDA has changed the reference amount for the "Nut and seed butter * * *" category from 30 g to 2 tbsp. (volume equivalent to 30 g). However, manufacturers that make whipped peanut butter must comply with other labeling requirements for aerated food in new § 101.12(e).

(48) Potatoes and sweet potatoes/yams: French fries, hash browns, skins, or pancake

FDA proposed 70 g as the reference amount for this product category.

109. Two comments stated that French fries come in many different sizes and styles (e.g., shoestrings, thin crinkles, regular crinkles, dinner fries), and that they are prepared in many different ways (e.g., deep fat frying, microwave cooking, skillet frying, conduction oven hearing). The variation in the size and style of the cut and in the preparation method makes it difficult to determine the serving size of frozen French fries because the yield differs for different sizes, styles, and preparation methods. The comment requested that FDA establish a reference amount of 85 g for the uncooked form of the products. The comment submitted data on the cooking loss for different types of french fries that showed that the weight loss varied from about 15 to 40 percent for different sizes, styles, and quantities cooked.

FDA recognizes that there are many differing sizes, styles, and preparation methods for French fries and agrees that a reference amount for the uncooked frozen product would promote uniformity in the serving sizes of frozen french fries. Based on the average percent cooking yield of 78 percent reported by USDA (Ref. 18), FDA estimated that 89-g frozen French fries would be needed to make the 70 g of prepared French fries that are customarily consumed. The 89-g reference amount approximates 3 oz in a household measure. Therefore, the 85-g reference amount (equivalent to 3 oz) suggested in the comment is reasonable for the uncooked frozen French fries. Accordingly, FDA has revised the reference amount to read: "70 g prepared; 85 g for frozen unprepared French fries."

(49) Potatoes and sweet potatoes/yams: plain, fresh, canned, or frozen

FDA proposed 110 g as the reference amount for this product category.

110. A trade association requested that FDA change the reference amount to the g weight of 1/2 cup because it is the amount currently used by the industry on canned potato products. The comment also opposed the requirement that the nutrient content be based on the drained weight of the product. The comment contended that nutrition labeling for this product has been traditionally labeled on the contents of the entire container.

FDA advises that the serving size declared on the product label is, by statute, an amount customarily consumed. Food consumption data showed that the amount customarily consumed for plain potatoes is 110 g, not the g equivalent of 1/2 cup (90 g drained solids) as recommended in the comment (Ref. 2). Therefore, FDA rejects this request.

Consistent with the agency decision on the nutrition information on an "as packaged" basis for canned beans, potatoes, and vegetables discussed in section III.H.2. of this document, FDA has revised the reference amount for canned potatoes to include the liquid. Using the average yield of 68 percent reported by USDA (Ref. 18), the agency has determined the reference amount for canned potatoes including the liquid, to be 160 g. Accordingly, FDA has revised the reference amount to read: "110 g for fresh or frozen; 160 g for canned in liquid."

(50) Salads: pasta or potato salad

FDA proposed 140 g as the reference amount for the product category.

111. One comment recommended that FDA change the reference amount to a volume-based reference amount. The comment contended that consumers measure these products on a volume basis, and therefore, a volume measure is more consumer friendly than a weight measure. The comment recommended 1/2 cup for the reference amount.

FDA advises that it is not necessary to change the reference amount to a volume-based reference amount to make it consumer friendly. Reference amounts appear only in the Code of Federal Regulations, and consumers usually do not see them. Although the reference amount is in g, the label serving sizes of products in this category will be expressed in cup measures because cup is the common household measure most appropriate for products in this category. Manufacturers should determine the cup measure that most closely approximates 140 g of their product.

112. A few comments claimed that the proposed reference amount is too large. The comments contended that most single-serving containers of these products hold 3.5 oz, and that manufacturers do not make single-serving containers that hold 5 oz (140 g). One comment claimed that serving scoops measure 3.5 oz. The comments recommended that FDA change the reference amount to 100 g.

The serving size on the product label is, by statute, an amount customarily consumed. Food consumption data showed that the customarily consumed amount of products in this category is 140 g, not 100 g (Ref. 2). Therefore, the agency cannot change the reference amount to make it consistent with the single-serving container size or the serving scoop size. The agency notes that the serving size of a 3.5 oz single-serving container will be the content of the container, not 140 g. However, the 140 g reference amount, not 3.5 oz, will be used to evaluate the qualification of this single-serving container for claims.

(51) Salads: all other salad, e.g., egg, fish, shellfish, bean, fruit, or vegetable salad

FDA proposed 100 g as the reference amount for this product category.

113. One comment requested that FDA expand the salads category to have a separate reference amount for "entree" type salads (e.g., pasta and seafood salad, tuna salad) and to reflect changes in the past decade in the availability and variety of salads in the supermarkets and restaurants. The comment contended that these major changes in salad consumption have occurred since the 1977–1978 NFCS, and therefore, the changes were not reflected in that survey.

FDA advises that it used both the 1977–1978 NFCS and the 1987–1988 NFCS in determining the reference amount for salad proposed in the 1991 serving size proposal. Therefore, by using data from the 1987–1988 NFCS, the changes in the salad consumption practices since the 1977–1978 NFCS were factored into the determination of the reference amounts for salads. The agency also points out that § 101.9(j)(2) and (j)(3) exempt deli foods and restaurant foods (e.g., salad bars). Accordingly, FDA has retained the reference amount as proposed.

(52) Sauces, dips, gravies, and condiments: all categories

FDA grouped these products into five categories with separate reference amounts.

114. One comment stated that some sauces might be more appropriately grouped in different categories. The comment contended that because barbecue sauce and marinade are more similar to catsup than to dips in their usage, they "might" be included in the

major condiments instead of with the hollandaise and tartar sauce. The comment continued that cocktail sauce is used in the same manner as tartar sauce and would more appropriately be grouped with tartar sauce. Worcestershire sauce might be more appropriately included with major condiments because it is used in a similar manner to steak sauce and soy sauce. The comment did not submit any data to substantiate the suggested regrouping of sauces.

FDA advises that it has classified products in this category according to the similarity in the customarily consumed amounts as reported in the 1977–1978 NFCS and the 1987–1988 NFCS. As explained in section III.D.5.a. of this document, the agency cannot recategorize products merely because someone believes that the products need to be regrouped. Accordingly, FDA rejects this suggestion.

(53) Sauces, dips, gravies, and condiments: barbecue sauce, Hollandaise sauce, tartar sauce, other sauces for dipping (e.g., mustard sauce, sweet and sour sauce), all dips (e.g., bean dips, dairy-based dips, salsa), marinade

FDA proposed 2 tbsp. as the reference amount for this product category.

115. Several comments stated that the 2-tbsp. reference amount is too large for marinades. The comments contended that most of the marinade is discarded after use, so the amount consumed is only about 1 tbsp. or less. The comments recommended that FDA include marinade in the "Major condiments" category because the amount of marinade consumed is closer to the reference amount for this category than that of the proposed category.

FDA acknowledges that much of the marinade is discarded after use. There is no good estimate about what percentage of the marinades used is actually consumed, but the amount consumed is certainly less than the amount used. The smaller reference amount for related products is 1 tbsp. Therefore, the agency has concluded that 1 tbsp. is more reasonable for marinades than 2 tbsp. Accordingly, FDA has moved marinades to the "Major condiments" category.

(54) Sauces, dips, gravies, and condiments: major main entree sauces, e.g., spaghetti sauce

FDA proposed 1/2 cup as the reference amount for this product category.

There was no request for a change in the reference amount for this product category. However, to follow the decision made in section III.D.2. of this document for converting the volume-based reference amount to the weight-based reference amount, the agency has changed the reference amount from 1/2 cup to 125 g (Ref. 55) using the g-weight-per-cup measure for spaghetti and marinara sauce reported by USDA (Ref. 56).

(55) Sauces, dips, gravies, and condiments: minor main entree sauce (e.g., pizza sauce, pesto sauce), other sauces used as toppings (e.g., gravy, white sauce, cheese sauce), cocktail sauce

FDA proposed 1/4 cup as the reference amount for this product category.

116. One comment stated that the 1/4-cup reference amount seems large, and that a 2-tbsp. reference amount may be more appropriate. The comment also suggested that cocktail sauce is used in the same manner as tartar sauce, so it would be more appropriate to include it in the Barbecue sauce category.

FDA advises that the serving size on the product label is, by statute, an amount customarily consumed. Food consumption data showed that the customarily consumed amount of cocktail sauce is 1/4 cup (Ref. 2). Accordingly, FDA has retained the reference amount as proposed.

(56) Sauces, dips, gravies, and condiments: major condiments, e.g., catsup, steak sauce, soy sauce, vinegar, teriyaki sauce, etc.

FDA proposed 1 tbsp. as the reference amount for this product category.

117. One comment requested that FDA change the reference amount to 2 tbsp. because it believed that 2 tbsp. is more consistent with the usage of these condiments. The comment submitted no data to support this change in the reference amount.

FDA advises that the 1 tbsp. reference amount was based on the amount customarily consumed of these condiments (Ref. 2). As explained in section III.D.5.a. of this document, the agency cannot change the reference amount because someone believes it is too small. Accordingly, FDA has retained the reference amount as proposed.

(57) Sauces, dips, gravies, and condiments: minor condiments, e.g., horseradish, hot sauce, mustard, worcestershire sauce, etc.

FDA proposed 1 tsp. as the reference amount for this product category.

118. One comment argued that 1 tsp. of hot sauce is too large. The comment contended that the average amount consumed is 1/2 tsp. for the regular hot sauce and 1/4 tsp. for extra hot sauce. The comment did not submit any data to support the suggested reference amounts.

FDA advises that the 1977–1978 NFCS and the 1987–1988 NFCS showed that the amount customarily consumed of hot sauce is about 1 tsp. (Ref. 2). The comment did not submit food consumption data to support that the amounts customarily consumed are 1/2 tsp. for the regular hot sauce and 1/4 tsp. for the extra hot sauce. Accordingly, FDA has retained the reference amount as proposed.

(58) Snacks: all varieties, chips, pretzels, popcorns, extruded snacks, fruit-based snacks (e.g., fruit chips), grain-based snack mixes

FDA proposed 30 g as the reference amount for the product category.

119. Many comments from the popcorn industry opposed the weight-based reference amount. The comments stated that popcorn kernels differ in their expansiveness. More expansive hybrid kernels produce a larger volume than less expansive kernels. Therefore, the comments said, the proposed 30-g reference amount would result in different serving sizes in volume (cups) for different brands of popcorns on a popped basis. The comments contended that popcorn typically is consumed by volume rather than weight and requested that FDA establish a separate volume-based reference amount for popcorn. The comments recommended 3 cups popped as the reference amount.

One comment contended that when products within the product category differ widely in density, FDA expressed the reference amount in volume, not in weight. As an example, the comment argued that FDA proposed the reference amount for ready-to-eat breakfast cereals in cups, instead of g. The comment contended that because the densities of different brands of popcorns differ widely, FDA should also express the reference amount for popcorn in volume, not in weight. Some comments claimed that consumers will be confused when they see different volume serving sizes on different brands that represent the same serving size because they weigh the same. The comments did not submit any food consumption data to support their contention that more expansive popcorns and less expansive popcorns are consumed in equal volume on a popped basis, or data to substantiate the claim that the different volume serving sizes on different brands of popcorn would be confusing to consumers.

FDA recognizes that popcorns differ in their expansiveness, and that the

weight-based reference amount would result in different volume serving sizes for different brands of popcorn because the expansiveness of popcorn kernels depends on the variety of corn and its moisture content (Ref. 57). However, the agency advises that it cannot have a volume-based reference amount (cups) for popcorn because the g weight of the cup measure of popcorn cannot be determined accurately. Expansiveness of unpopped corn depends on the popping method (Ref. 57). Many factors such as handling and shipping practices, measurement methods, and timing of measurement can affect the accuracy of the g weight of the cup measure of popped corn. As discussed in sections III.D.5. and III.F.1. of this document, there is no well-established standard procedures for determining the g-weight equivalents of the household measures. This inaccuracy in volume-based reference amount makes compliance monitoring impossible. The agency notes that in light of the difficulty in accurately measuring the g-weight equivalents of the household measures, it has decided to convert volume-based reference amounts to the weight-based reference amount where feasible (see section III.D.2. of this document). As a result, the reference amount for ready-to-eat breakfast cereals in the final regulation is in g, not in cups.

Because none of the comments submitted food consumption data to support their contention that more expansive and less expansive popcorns are consumed in equal volume, the agency is not sure that popcorns having different expansion ratios are consumed in equal volume. Furthermore, the agency points out that popcorns come in many different varieties: Plain, flavored, and carameled with or without nuts. The uniform 3 cup reference amount suggested in the comments may not be applicable to all popcorns. Food consumption data showed that the customarily consumed amount of carameled popcorn is 1 cup (Ref. 41).

As for the comments that claimed that consumers will be confused to see serving sizes that differ in the number of cups on different brands of popcorn, the comments did not submit any data to substantiate this claim. Therefore, the agency is not sure of its validity. However, the agency recognizes that many consumers may consume popcorn by volume rather than weight. For the benefit of consumers who consume popcorn on a volume basis and would like to know the nutrient contents of different brands of popcorn on an equal volume basis, the agency would not object to manufacturers providing voluntary labeling of a second column of values on a per cup popped basis (see § 101.9(b)(10)(iii)). This voluntary second column per cup applies only to popcorn and not to other snacks.

For the reasons explained above, the agency has concluded that the weight-based reference amount for popcorn should be retained. Accordingly, FDA has retained the 30-g reference amount as proposed in new § 101.12(b), Table 2.

120. Some comments stated that it is not clear whether the reference amount for popcorn refers to the weight of the kernels before popping or to the weight of the finished product because popcorn is sold both in popped and unpopped form. The comments contended that the reference amount for popcorn should be on a popped basis.

As explained in the preamble (56 FR 60394 at 60407) and in footnote 2 to Tables 1 and 2 in the 1991 serving size proposal, the reference amounts in § 101.12(b) are for the ready-to-serve or almost ready-to-serve (e.g., heat and serve, brown and serve) form of the product. Therefore, the 30 g reference amount is for the popped popcorn. New § 101.12(c) provides that the reference amount of a product that requires cooking or the addition of water or other ingredients is the amount required to prepare one reference amount of the final product as established in new § 101.12(b). Therefore, the reference amount for the unpopped popcorn would be the amount of unpopped corn that is required to make 30 g popped corn.

121. One comment recommended that FDA change the reference amount for all "bulk snacks measurable by a cup" other than popcorn to 1 cup. The comment claimed that NFCS data showed that the mean consumption of snacks is "38.1 g" which reasonably supports the 1 cup reference amount that it recommended.

As stated above, the serving size on the product label is, by statute, an amount customarily consumed. Food consumption data show that the customarily consumed amount for snacks is 30 g (Ref. 2). The g-weight-per-cup measure reported by USDA (Ref. 31) showed that the g weight of 1 cup of snacks, other than popcorn, that are measurable by a cup vary widely. For example, one cup of cheese balls weighs 35 g, whereas one cup of corn nuts weighs 91 g. Therefore, the 1 cup reference amount suggested in the comment does not reflect the amount customarily consumed of snacks, and FDA rejects this recommendation.

122. A manufacturer of "dried fruit snacks" (pressed dried fruit) stated that each individual piece of the dried fruit snack comes in 0.5 to 1 oz pieces. The 30-g reference amount would make the serving size of many of these products two pieces. The comment requested that FDA change the reference amount for the "dried fruit snacks" to 0.5 or 0.75 oz. The comment did not submit any food consumption data to support the suggested reference amounts.

The serving size on the product label is, by statute, an amount customarily consumed. Because the 1977–1978 NFCS did not have dried fruit snacks listed, the agency used the 1987–1988 NFCS to determine the amount customarily consumed for all types of pressed dried fruit. The analysis showed that the customarily consumed amount for pressed dried fruit is about 1 oz, not 0.5 or 0.75 oz (Ref. 41). Therefore, FDA rejects the request.

(59) Soups: all varieties

FDA proposed 1 cup as the reference amount for the product categories.

123. A manufacturer requested that FDA define the reference amount for soups in g. The manufacturer contended that a volume-based reference amount will cause an enormous additional laboratory and administrative burden for the manufacturer.

In light of the difficulty in determining the g weight of the household measure, FDA has concluded in section III.D.2. of this document that the volume-based reference amount should be converted to the weight-based reference amount where the weight-based reference amount is feasible. Because the g-weight-per-cup information is available, and products in this category are relatively uniform in density, the agency has concluded that a weight-based reference amount can be determined for this category. Using the g-weight-per-cup measure reported by USDA (Ref. 58), the agency has determined the average weight per cup for soups to be 245 g (Ref. 55). Accordingly, FDA has revised the reference amount to 245 g.

(60) Sugars and sweets: baking candies (e.g., chips) and hard candies

FDA proposed 15 g as the reference amount for the product category.

124. Several comments from the hard candy industry opposed the uniform 15 g reference amount for all hard candies. The comments stated that the entire package of breath mints or the entire roll of roll candies would be one serving with a 15 g reference amount. The comments contended that some hard candies (e.g., breath mints, hard roll candies) are consumed in much smaller quantities than other hard candies and

should have separate smaller reference amounts.

The comments differed with respect to specific recommendations for the reference amounts. Comments from the breath mint industry stated that breath mints are consumed for the purpose of "freshening" one's breath, not as a candy. Most of these comments recommended one piece as the reference amount for breath mints because breath mints are customarily consumed one piece at a time. One comment stated that a recent consumer survey showed that 60 percent of those surveyed customarily consumed one piece of the breath mint per eating occasion. The comment did not submit any data to support the statement. Another comment recommended that the reference amount should be one piece for hard roll candies and three pieces for "bite-size" hard candies, including breath mints. The comment submitted data from a marketing research survey to support the recommended reference amounts. This survey showed the number of candies that people put in their mouth at a time.

One comment argued that although breath mints and hard candies are often consumed one piece at a time, several pieces are consumed together during what should be considered one eating occasion. Therefore, the reference amount for these candies should not be one piece. The comment did not submit any supporting data.

One comment recommended that FDA divide hard candies into three categories by the piece size and establish a separate reference amount for each size category. Another comment from a manufacturer of hard candies recommended a 4-g reference amount for hard candies that weigh 4 g or less, based on the candy consumption data that it collected through an independent "home use test" mail survey. The comment also suggested placing these candies under the Miscellaneous category with baking decorations. The manufacturer submitted detailed descriptions of the survey methodology and demographic and socioeconomic distributions of the survey respondents, the methodology used to determine a piece weight, and detailed piece weight and consumption data. The survey tested four different "mini candies and mints" that weigh 2.4 g or less per piece. The survey included 1,333 households, covering all 9 U.S. census divisions, that have used the "test candies" or similar candies. The survey was designed to parallel, as closely as possible, the demographic and socioeconomic characteristics of the U.S. population ages 4 and older.

A comment from a Federal agency suggested a 10-g reference amount because it believed that the 15-g reference amount was too large. No data were submitted to support the suggested 10-g reference amount. A comment from a foreign government recommended that FDA change the reference amount to 30 g. The comment stated that, in the case of baking chocolate, 30 g closely approximates 1-oz squares of baking chocolate and is equivalent to the weight of chocolate chips in 3 to 5 cookies.

FDA recognizes that the hard candy category encompasses a wide variety of hard candies which may differ in amounts customarily consumed. Because the NFCS grouped all hard candies in one food code, the agency was unable to establish separate reference amounts for different types of hard candies. The NFCS showed that the amount customarily consumed for all hard candies was 1/2 oz. Consequently, the agency proposed a 15-g reference amount for the hard candy category.

FDA carefully examined all arguments and data submitted in the comment. With regard to the comments that requested a 1-piece reference amount for breath mints, the comments did not submit any food consumption data to support that 1 piece is the customarily consumed amount. Therefore, FDA has not adopted this request.

With regard to the comment that requested a 1-piece reference amount for hard roll candies and a 3-piece reference amount for "bite-size" hard candies, the data from the marketing research survey that were submitted in support of these reference amounts do not represent the customarily consumed amount. The survey asked how many pieces of the test candies people put in their mouth at a time. The survey, however, did not ask how many candies the people wound up eating per eating occasion. To determine the amount consumed per eating occasion, information on the number of candies people put in their mouth at a time and the number of times this process was repeated. Consequently, the data submitted are inappropriate. Therefore, FDA rejects this request.

With regard to the comment that requested dividing hard candies into three categories by the size of the candy and establishing a separate reference amount for each size, the comment did not submit food consumption data to show that the customarily consumed amounts of hard candies by size. In addition, dividing hard candies into three categories by the size of candy can encourage manipulation of the candy size to fit in a more favorable category. Therefore, FDA rejects this request.

FDA examined carefully the data from the "home use test" mail survey. The data were collected under the actual conditions of use and represented the consumption by the U.S. population 4 years of age or older. The survey had a sample size over 10 times that of the 1977–1978 NFCS and over 40 times that of the 1987–1988 NFCS for the hard candy consumption. The results of this survey supported that the customarily consumed amount is 2 g for breath mints and 5 g for roll-type hard candies. The survey also showed that the customarily consumed amount of mini-size candies in dispenser-type packages is less than 5 g. Although the survey only tested the comment's own brand, this study is the only food consumption data available to the agency for specific types of hard candies that were collected under actual conditions of use, and the manufacturer is a major producer of the types of candies tested.

Therefore, the agency has concluded that breath mints, roll-type candies, and mini-size candies in dispenser-type packages should have separate reference amounts. Accordingly, FDA has divided hard candies, based on the type of candy, into three categories each with their own reference amount as shown below:

Hard candies, breath mints—2 g

Hard candies, roll-type and mini-size in dispenser-type packages—5 g

Hard candies, others—15 g

With regard to the comment from the Federal agency, the comment did not submit any food consumption data to support the 10-g reference amount. With regard to the comment from the foreign government, the agency also notes that because the reference amount for cookies is 30 g, the reference amount for baking candies (e.g., chocolate chips), which are only part of the cookie, cannot be 30 g. Therefore, FDA rejects these requests.

(61) Sugars and sweets: all other candies

FDA proposed 40 g as the reference amount for this product category.

125. A few comments recommended a 1-oz reference amount. The comments contended that a uniform 1-oz reference amount would allow for fast and accurate nutrition comparisons of different candies.

Food consumption data showed that 40 g (not 1 oz) is the amount customarily consumed of candies (Ref. 2). The agency notes that regardless of what the reference amount is, most candies come in discrete units, and

therefore, the serving size for most candies will be in the number of pieces according to new § 101.9(b)(2)(i). Because the piece size varies for different candies, the serving sizes for candies will differ. Therefore, a uniform 1-oz reference amount is not going to facilitate nutrition comparisons of different candies any better than the 40-g reference amount. Accordingly, based on these factors and the fact that the comment did not present any data to show that the amount customarily consumed is any different than the amount that the agency proposed, FDA has retained the reference amount as proposed.

126. One comment from a manufacturer requested that FDA create a separate category for specialty fine chocolates/pralines with a reference amount of one piece. The comment contended that these specialty fine chocolates/pralines are unique and deserve a separate category because: (1) The proposed reference amount would make the serving size of these candies three to four pieces, yet these candies are individually wrapped and intended and promoted to be consumed one piece at a time, (2) purchasers of these candies do not "customarily consume" three to four pieces at a time, and (3) unlike other candies that come in several sizes, the manufacturer's chocolates/pralines come only in one size. A comment from another manufacturer stated that the 40-g reference amount is too large for "after dinner mints," and that FDA should establish a separate reference amount for "after dinner mints." Two comments from a foreign country stated that the proposed reference amount is too large for fine bonbons. The comments did not suggest what the reference amount for bonbons should be or submit any data to support their claim.

FDA advises that the serving size on the product label is, by statute, an amount customarily consumed. None of the comments submitted food consumption data that show that the customarily consumed amounts of these candies differ from the proposed reference amount. Therefore, FDA has rejected this request.

(62) Sugars and sweets: confectioner's sugar

FDA proposed 1/4 cup as the reference amount for this product category. The agency notes that the reference amount in the 1991 serving size proposal (56 FR 60394 at 60419) had a typographical error and stated that the reference amount is 2 tbsp. A correction notice was published on March 6, 1992 (57 FR 8179).

No objections have been raised on the proposed reference amount. As discussed in section III.D.2. of this document, the agency has decided to change the volume-based reference amount to the weight-based reference amount where feasible. Accordingly, FDA has changed the 1/4-cup reference amount to the g-weight equivalent to 1/4 cup, i.e., 30 g, using the g-weight-per-cup measure in the USDA Agriculture Handbook (Ref. 57).

(63) Sugars and sweets: honey, jams, jellies, fruit butter, molasses

FDA proposed 1 tbsp. as the reference amount for this product category.

127. A comment from a trade association for jelly and preserves supported the proposed reference amount. Comments from a trade association and a consumer organization requested that FDA change the reference amount to 2 tsp. for honey. One comment contended that the reference amount for honey should be the same as the reference amount for sugar because these products are used interchangeably. In addition, the comment asserted that data from the 1977–1978 NFCS supported the 2-tsp. reference amount for honey because the median consumption was 2 tsp., and the mode was 1 tsp.

FDA acknowledges that honey is used interchangeably with sugar in some foods (e.g., tea). However, honey has many uses. It is also used interchangeably with jam and jelly on toasts and in sandwiches, as shown by the manufacturers' suggested uses on the label. The agency notes that the 1977–1978 NFCS and the 1987–1988 NFCS together reveal that the customarily consumed amount of honey is 1 tbsp., not 2 tsp. (Ref. 2). As explained in section III.D.1. of this document, the agency is not using a reference amount that is based solely on the 1977–1978 NFCS. The agency also notes that the 1977–1978 NFCS showed the mean consumed amount was 3.3 tsp. with two modes (not one as claimed in the comment), one at 1 tsp. and one at 3 tsp. (equivalent to 1 tbsp.). The comments thus have not shown that a separate 2 tsp. reference amount for honey is appropriate. Accordingly, FDA has retained the reference amount as proposed.

128. A manufacturer requested adding "Nutella" to this category. "Nutella," imported from Europe, is a chocolatey spread made from sugar, milk powder, cocoa, pulverized toasted hazelnuts, cocoa butter, and vegetable oil. The company promotes it for use with fruit, crackers, breads, or desserts and asserted that it is used like jams and jellies and, therefore, should be included in this category with a reference amount of 1 tbsp. The company submitted a home use survey conducted by an independent research group to support its assertion.

Because this product is not a commonly consumed food in the United States, it was not listed in the USDA NFCS, which FDA relied on as the source for information on food consumption practices of the U.S. population. As a result, "Nutella" was not included in the "List of products for each product category" that FDA referenced in the 1991 serving size proposal (Ref. 20). According to the description provided in the comment, the product resembles chocolate syrups used as a dessert topping, except that "Nutella's" consistency is thicker than chocolate syrup. The survey data submitted by the manufacturer showed that the major use of 'Nutella" is as a dessert topping with ice cream as opposed to a substitute for jam and jelly with bread. Twenty-seven percent of the 157 respondents surveyed stated that their favorite way of using "Nutella" is with ice cream, whereas only 8 percent named bread. FDA concludes, based on the product characteristics and the usage data provided in the comment, that "Nutella" belongs to the "Other dessert toppings * * *" category under Dessert Toppings and Fillings, not the "Honey, jams, jellies, * * *" category under Sugars and Sweets with a reference amount of 2 tbsp. FDA has revised the product category name for dessert toppings to include the dessert spread. The modified name reads: "Other dessert toppings, e.g., fruits, syrups, spreads, marshmallow * * *" If the company believes that FDA misclassified its product, it can petition FDA to reclassify the product category, but the petition must be accompanied with information specified in § 101.12(h), including food consumption data (the amount customarily consumed) under actual conditions of use.

(64) Sugars and sweets: popsicles, snow cones

FDA proposed 85 g as the reference amount for this product category.

129. Two comments recommended moving popsicles to the frozen dessert category because they are frozen desserts, and they are used interchangeably with products in that category (e.g., ice cream, frozen yogurt, sherbet). The comments differed, however, in the recommended reference amount. One comment recommended a 1/4-cup or 2.5-fl oz reference amount for popsicles because the nutrition

information for these products has been traditionally declared on a volume basis. The other comment recommended a 1/2-cup reference amount, the same as for other frozen desserts in the "Ice cream, ice milk * * *" category (the ice cream category).

First, FDA notes that the product category name has been changed to read: "Frozen flavored and sweetened ice and pops, frozen fruit juices: all types, bulk and novelties (e.g., bars, cups)" (referred to as frozen pops for simplicity) (see section III.D.4.b. of this document).

With regard to the placement of these products, in the 1991 serving size proposal, the agency listed the frozen pops under Sugars and Sweets following the categorization system for the NFCS. The agency agrees with the comments that frozen pops are used as a substitute for other frozen desserts, as shown by how they are positioned in the marketplace, and by how they are grouped in common food composition books (Refs. 37 and 59). Therefore, the agency has concluded that frozen pops should be moved to the Desserts category.

With regard to the request for changing to a volume-based reference amount because the nutrition information on these products has been traditionally declared on a volume basis, the agency advises that according to the act, the serving size should be in a common household measure that is appropriate to the product (section 403(q)(1)(A)(i) of the act). Products in the frozen pops category, with the exception of frozen ice, come in discrete units (e.g., bars), and therefore, the serving size will be the number of pieces, not the volume (e.g., fl oz or 1/2 cup) that is customarily consumed. Consequently, under the act, the nutrition information on frozen pops (excluding frozen ice) will be provided on a piece, and not a per fl oz or per cup, basis. Therefore, the comments' arguments do not justify changing the weight-based reference amount to a volume-based reference amount. Unlike the products in the ice cream category, which are difficult to express in weight because they tend to be highly aerated and differ in density, frozen pops are usually not aerated, are high in moisture, and are relatively uniform in density. Thus, the reference amount can be expressed in g. For compliance monitoring purposes, the weight-based reference amount is more effective than the volume-based reference amount. Therefore, the agency has decided to retain the weight-based reference amount for frozen pops.

With regard to the request to change the reference amount to 4 fl oz to make it the same as the reference amount for other frozen desserts, the agency advises that the customarily consumed amount in volume is not the same for the frozen pops and the products in the ice cream category. The 3-oz customarily consumed amount for frozen pops is equivalent to about 2.6 to 2.8 fl oz because of their high density. Consequently, the agency cannot change the reference amount of frozen pops to 4 fl oz to make it the same in volume as the reference amount for the ice cream category.

Accordingly, FDA has retained the reference amount as proposed.

(65) Sugars and sweets: sugar

FDA proposed 8 g as the reference amount for this product category.

130. Two industry comments requested that FDA change the reference amount to 1 tsp. One comment contended that the available food consumption data do not provide a good estimate of the amount of sugar customarily consumed. The comment stated that the concept of an eating occasion is not suited to a serving size determination for sugar because of the multiple uses of sugar that result in its being consumed in several foods at one eating occasion and in multiple servings of food with added sugar (e.g., coffee) as part of that eating occasion. For example, sugar may be added to coffee, cereal, and grapefruit at breakfast. The amount of sugar consumed per eating occasion in this case would be the total amount of sugar added to all three foods. In addition, many people consume multiple servings of coffee per eating occasion, and the sugar consumed in the multiple servings must be summed to arrive at the amount consumed per eating occasion. The comment also pointed out that the 1977–1978 NFCS and the 1987–1988 NFCS assumed a 2-tsp. serving size when the quantity consumed was not provided by the respondent. The comment contended that this assumption contributed to the conclusion that 2 tsp. is the amount customarily consumed. The comment submitted results of its analysis of data from the 1987–1988 NFCS to show the impact that the use of the default serving size and the consumption of multiple servings had on the determination of the customarily consumed amount of sugar. The comment urged FDA to utilize other relevant information in determining the reference amount, such as the 1-tsp. serving size currently used by the industry and in single-serving packets currently available in grocery stores and restaurants. The comment also contended that: (1) The 1 tsp. serving size has been used by industry for over 12 years, (2) the 1 tsp. serving size is well understood and accepted by consumers, and (3) 1 tsp. is the most convenient and practical measure of sugar.

FDA carefully examined all arguments and data submitted in the comment in support of the 1-tsp. reference amount. FDA acknowledges that because the determination of the serving sizes of foods was not one of the major objectives of the NFCS, data were not collected in a manner to accurately determine all serving sizes, and the NFCS does not accurately reflect the amount of sugar customarily consumed per eating occasion. The agency acknowledges that the amount customarily consumed per eating occasion derived from the NFCS may have been overestimated because the amount of sugar consumed per eating occasion may have included the sugar used in several foods rather than in separate eating occasions. The agency also acknowledges that a major home use of sugar in the United States is to sweeten coffee and tea. The data submitted in the comment showed that a large percentage of people consumed multiple servings of coffee (i.e., 2 or more times the reference amount). The amount of sugar consumed in these multiple servings of coffee would be more than what is used in one reference amount of coffee. Consequently, the amount of sugar customarily consumed in coffee would have been overestimated each time more than 1 cup was consumed.

For the reasons explained above, the agency has concluded that the 2-tsp. customarily consumed amount, derived from the NFCS, is an overestimate of the true customarily consumed amount for sugar. The true customarily consumed amount for sugar is less than 2 tsp. Therefore, the agency has concluded that NFCS data are insufficient to determine the amount customarily consumed for sugar.

As stated in § 101.12(a)(5), when food consumption survey data are insufficient, the agency considered other sources of information including serving sizes recommended in comments and serving sizes used by manufacturers. Because: (1) The next smallest reference amount less than 2 tsp. that corresponds to a common household measure is 1 tsp., (2) 1 tsp. serving size has been used for over 12 years and thus consumers are likely to be familiar with the 1 tsp. serving size, (3) several comments both on the 1990

and the 1991 serving size proposals supported 1 tsp. serving size, and (4) food consumption data did not provide a reasonable basis to change the current industry practice, the agency has concluded that 1 tsp. is the most reasonable reference amount for sugar. Accordingly, FDA has revised the reference amount to 4 g (equivalent to 1 tsp.).

(66) Sugars and sweets: syrups

FDA proposed 60 mL as the reference amount for this product category.

131. An industry comment requested that FDA change the reference amount for light and dark corn syrups to 30 mL. The comment contended that these syrups are used for different purposes than the syrups used on pancakes and waffles. The comment submitted data from a "strategic study" showing that these syrups are used as cooking ingredients rather than poured on pancakes or waffles.

FDA has examined the data submitted in the comment. The agency agrees that the data submitted in the comment show that light and dark corn syrups are used as cooking ingredients rather than poured on pancakes or waffles. Because these syrups are consumed as an ingredient of other foods, NFCS did not have food consumption information for these syrups per se. Using the recipe file for the 1987–1988 NFCS (Ref. 49), the agency has estimated the average amount of these syrups consumed in one reference amount of the final dishes that contain these syrups is about 30 mL. Therefore, the agency has concluded that 30 mL (equivalent to 30 g) is a more reasonable reference amount for light and dark corn syrups than 60 mL (Ref. 50). Accordingly, FDA has revised the reference amount to read: "30 mL for syrups used primarily as an ingredient (e.g., light or dark corn syrup); 60 mL for all others."

(67) Vegetables primarily used for garnish or flavor, e.g., pimento, chili pepper, green onion, parsley: fresh or canned

FDA proposed 30 g as the reference amount for this product category.

132. One comment contended that pimiento/pimento is a specialty canned food item and is an ingredient that is used only in small quantities to enhance the flavor and color of various dishes. The comment argued that because pimento is never used by itself as a vegetable, the 30-g reference amount is too large for pimentos. A nutrition professional organization stated that the proposed reference amount reflects use as a vegetable, not a garnish or flavor.

FDA has reexamined the reference amount for this category. In the interest of minimizing product categories, in the 1991 serving size proposal, the agency included pimento, chili pepper, green onion, and parsley in one group. Because pimento is used primarily as an ingredient of other foods, and the analysis to determine the amount of pimento customarily consumed is time consuming, the agency did not determine the customarily consumed amount for pimento per se due to time constraints. In response to the comment, FDA has determined the amounts of pimento and parsley customarily consumed. The results of the data analysis supported a smaller reference amount (4 g) for pimento and parsley than for chili pepper or green onion (Ref. 41). Therefore, the agency has concluded that this product category should be divided into two categories: Vegetables primarily used for garnish or flavor, e.g., pimento, parsley with a reference amount of 4 g, and chili pepper, green onion with a reference amount of 30 g. FDA has revised § 101.12(b) accordingly.

(68) Vegetables: all other vegetables without sauce: fresh, canned, or frozen

FDA proposed 85 g as the reference amount for this product category.

133. Comments from two trade associations supported the reference amount. One comment opposed the use of the nutrition information on a drained weight basis. The comment presented data showing that a large percentage of consumers consume the liquid in canned vegetables.

As discussed in section III.H.2. of this document, the agency has decided that nutrition information on canned vegetables should be on an "as packaged" basis including the liquid. The 85-g proposed reference amount represents the amount customarily consumed for the solids only, and therefore, it is still applicable to fresh and frozen vegetables without sauce. To reflect the decision in section III.H.2. of this document, the reference amount for canned vegetables has to be reestimated to include the liquid. Using the information on the percent yield of the drained solids for canned vegetables reported by USDA (Ref. 18), the agency has determined that the amount customarily consumed for canned vegetables including the liquid is as follows: 95 g for vacuum packed vegetables and 130 g for vegetables canned in liquid (Ref. 55).

In the 1991 serving size proposal, pumpkin and winter squash were included in the vegetables with sauce category because although pumpkin and winter squash do not contain sauce, the customarily consumed amount was closer to the 110 g than the 85-g reference amount. In the final regulation, the agency has grouped pumpkin and winter squash with vegetables canned in liquid under the category of vegetables without sauce because the customarily consumed amounts of these vegetables are similar. In addition, FDA has moved cream-style corn and canned or stewed tomatoes from footnote 5 of Table 2 in the 1991 serving size proposal to the reference amount column in the final regulation because the reference amount for these two vegetables is the same as that for the vegetables canned in liquid, and therefore, the footnote is no longer necessary. The revised reference amount reads: "85 g for fresh or frozen; 95 g for vacuum packed; 130 g for canned in liquid, cream-style corn, canned or stewed tomatoes, pumpkin, or winter squash."

134. One comment recommended that vegetables with pasta and vegetables with rice be included in the vegetable category, not in the Mixed dishes category. The comment contended that the dietary guidance documents recommend 1/2 cup for vegetables, rice, and pasta, so there may be consumer confusion if 1/2 cup is not used for these foods when combined.

Vegetables with pasta and vegetables with rice are neither rice nor pasta nor vegetables. They are clearly mixed dishes because they contain two foods from two different food groups (the grain product group and the vegetable group). The comment did not submit any data to show that, for these products, a serving size other than 1/2 cup would cause consumer confusion.

Accordingly, FDA has rejected this comment.

(69) Vegetables: all other vegetables with sauce: fresh, canned, or frozen

FDA proposed 110 g as the reference amount for this product category.

135. A comment from a consumer recommended that FDA change the reference amount to 100 g because 100 g is a more rational metric size than 110 g.

FDA advises that for reasons explained in section III.D.1. of this document, it is not changing the reference amount to make it more rational in metric quantity. Accordingly, FDA has retained the reference amount as proposed.

(70) Vegetables: vegetable juice

FDA proposed a uniform 240-mL (8 fl oz) reference amount for this product category.

136. Comments from several manufacturers and trade associations and a comment from a nutrition professional organization supported the proposed uniform 8-fl oz reference amount for all beverages. One comment from a manufacturer requested that FDA establish a separate category for vegetable juice with a reference amount of 6 fl oz.

Considering the weight of support for the uniform 8-fl oz reference amount for all beverages and the benefit of the uniform reference amount that facilitates nutrition comparisons of different beverages, the agency has decided to retain the uniform 8-fl oz reference amount for all beverages, including vegetable juice. Vegetable juice is frequently used interchangeably with fruit juice and other beverages. Food consumption data also did not show that the customarily consumed amount for vegetable juice differs from that of fruit juice or of many other beverages (Ref. 2). The comment did not submit data that would support a different result. Accordingly, FDA has retained the reference amount as proposed.

(71) Vegetables: olives

FDA proposed 15 g as the reference amount for this product category.

137. One comment requested that FDA change the reference amount to 30 g. The comment contended that 30 g is the serving size that is currently used on packaging, and because pickles and olives have similar consumer usage patterns, the reference amount for olives should be the same as the reference amount for pickles.

FDA disagrees with the comment. The agency advises that the serving size on the product label is, by statute, an amount customarily consumed. Both the 1977–1978 NFCS and the 1987–1988 NFCS showed that the customarily consumed amount of olives is closer to 0.5 oz, not 1 oz. The comment did not present any data to show that 0.5 oz is not the customarily consumed amount. Accordingly, FDA has retained the reference amount as proposed.

6. Reference amounts for imitation or substitute food, altered food, and foods for special dietary use

To prevent the manipulation of serving sizes for nutrient content claims, FDA proposed in § 101.12(d) that the reference amount for an imitation or substitute food be the same as that of the food for which it is offered as a substitute. In addition, the agency proposed in § 101.12(e) that the reference amount for an altered version of a food, such as a "low calorie" version, be the same as for the food for which it is offered as a substitute.

FDA received about a dozen comments on this proposal from manufacturers, trade associations, and professional organizations. About one-third of the comments supported the proposal. The rest of the comments opposed it.

138. Comments opposing the proposal stated that one way that industry is reducing the fat and calorie content of foods is through a new technology that incorporates air into the product (referred to as "aerated food" for simplicity). Many aerated foods weigh significantly less than their regular counterparts. Comments stated that there is no concern when the reference amount is established in volume, but that there is a concern when a weight-based reference amount is used. For example, using a reference amount of 85 g for waffles, 3 aerated waffles would be compared to 2 regular waffles of the same size and shape. Therefore, the calorie and fat content of the aerated food would not be lower than that of the regular food when compared on an equal weight basis. Manufacturers would thus be unable to use a nutrient content claim for the aerated foods.

These comments argued that the proposal would diminish manufacturers' incentive to develop "nutritionally improved" foods and prevent consumers from benefitting from low fat, low calorie alternatives. The comments suggested that when the reference amount is determined by weight, FDA should allow the manufacturers to use "the volume measure (e.g., common household volumetric or dimensional measure or number of discrete units) equivalent to the volume measure of the manufacturer's regular product pursuant to the reference amount," e.g., 2 waffles for both the aerated and the regular food.

FDA has given careful consideration to all arguments and suggestions presented in these comments. Although the comments claimed that the amount customarily consumed for the regular and the aerated food is the same in volume, not in weight, no food consumption data were presented with the comments or are available from other sources to verify the claim. It is possible that people eat three aerated waffles, instead of two, to attain satiety. Therefore, FDA is not certain that the amount customarily consumed for the aerated foods and their regular counterpart is the same in volume.

At the same time, in light of the current dietary guidelines for reducing fat and calorie intakes (Refs. 60 through 62), FDA acknowledges that it is desirable to have a wide selection of low fat and low calorie foods available to consumers. Some consumers may benefit from having such aerated foods if they consume an equivalent volume of aerated food as they would have the regular food, e.g., two instead of three aerated waffles. However, FDA does not believe that the solution suggested in the comments is appropriate or desirable considering the wide variability in the unit size and shape of the regular products in discrete units. This variability would make it difficult to determine a reference point, i.e., volume equivalent to the reference amount of the regular counterpart.

FDA finds that the most reasonable solution to this problem is to allow the manufacturers to determine the reference amount in g for the aerated food by adjusting for the difference in density of the aerated food relative to the density of the regular counterpart (density-adjusted reference amount). For example, if the density of the aerated food is 30 percent lower than the density of the regular counterpart, the reference amount for the aerated food would be 30 percent less than the reference amount of the regular counterpart. For example, the reference amount for regular waffles is 85 g, so the reference amount for aerated waffles, which are 30 percent lower in density, would be 60 g. A manufacturer may use the density-adjusted reference amount to determine the label serving size and the qualification of the aerated food for nutrient content and health claims, provided that, upon request, the manufacturer will show FDA the detailed protocol and records of data described below. FDA will consider regulatory action under sections 402(b) and 403 of the act on any misuse of this allowance.

Such density-adjusted reference amounts may not be done for cakes. Although the product categories for cakes in the final regulation are identified by types of cakes, not by density, the three cake categories in Table 2 in new § 101.12(b) were determined according to the density of various cakes. FDA took the differences in the densities of different types of cakes having different degrees of air incorporation into consideration in determining the reference amounts for cakes. Therefore, further adjustment of the reference amounts for aeration is not permissible for cakes.

For the aerated food to qualify to use the density-adjusted reference amount, the product must be sufficiently lower in density than the regular counterpart. The agency finds that a 25-percent

reduction in density is a reasonable cutoff level for this purpose. The 25-percent minimum reduction is consistent with the minimum percent reduction requirement to qualify for a "less" or "reduced" claim in the regulation entitled "Food Labeling; Nutrient Content Claims, General Principles, Petitions, Definition of Terms" (hereinafter referred to as the nutrient content claims regulation), published elsewhere in this issue of the **Federal Register**. In estimating the difference in density, manufacturers must use an appropriate reference food as described in new § 101.13(j)(ii)(A) of the nutrient content claims regulation, published elsewhere in this issue of the **Federal Register**, for the regular counterpart.

In expressing the weight-based reference amounts for the regular foods in new § 101.12(b), FDA rounded the values to the nearest 5-g increment to avoid the appearance of an overly exact g-weight. Under § 101.12(e), this procedure must also be followed in determining the reference amount for the aerated food. Manufacturers must use the rounded density-adjusted reference amount to determine the serving size and whether the aerated food qualifies for a claim. The table below shows an example of the calculated density-adjusted reference amount and the corresponding rounded reference amount to be used for aerated waffles that have been reduced in density by 25 to 35 percent. As the table shows, aerated waffles with density reductions of 27 to 32 percent must use 60 g, not 58 to 62 g, as the reference amount.

Reference Amount for the Regular Waffle: 85 g

Percent reduction in density	Calculated Density-adjusted reference amount	Reference amount for "aerated" food
(%)	(g)	(g)
25	64	65
26	63	65
27	62	60
28	61	60
29	60	60
30	60	60
31	59	60
32	58	60
33	57	55
34	56	55
35	55	55

To use a density-adjusted reference amount, manufacturers must have the following available for inspection by FDA upon request: (1) A detailed protocol and records of all raw data and calculations used to determine densities of both the regular and the aerated products; (2) records of the sample size, the mean, and the standard deviation for the density measurements of the regular and the aerated products; and (3) records of all data, calculations, and procedures used to arrive at the "density-adjusted" reference amount for the aerated product. The protocol must contain identification and descriptions of all materials used (e.g., equipment) to determine the density. In determining the differences in the densities of the regular and the aerated products, manufacturers must also observe the following: (1) The regular and the aerated product must be the same in size, shape, and volume. To compare the densities of products having nonsmooth surfaces (e.g., waffles), manufacturers must use a device or method that ensures that the volumes of the regular and the aerated products are the same. One way to ensure the same volume is to use the same equipment to make the regular and the aerated products; (2) sample selections for the density measurements must be done in accordance with the provisions in § 101.9(g); (3) density measurements of the regular and the aerated products must be conducted by the same trained operator using the same methodology (e.g., the same equipment, procedures, and techniques) under the same conditions; and (4) density measurements must be replicated a sufficient number of times to ensure that the average of the measurements is representative of the true differences in the densities of the regular and the aerated products.

Manufacturers must use a descriptive term such as "whipped" or "aerated" as part of the product name (e.g., whipped peanut butter, aerated waffle) so that consumers are properly informed that extra air has been incorporated into the product. The use of this term is necessary, under section 201(n) and 403(a) of the act, to disclose a material fact.

To incorporate the labeling requirements for aerated foods, FDA has combined § 101.12(d) and (e), redesignated as § 101.12(d), and added the requirements for aerated products in § 101.12(e).

139. A manufacturer of medical foods stated that several aspects of the serving size regulation (e.g., expressing the serving size in the common household measure) are not accurate enough for medical foods.

FDA advises that the serving size regulations do not apply to medical foods because section 403(q)(5)(A)(iv) of the act exempts medical foods from all requirements of nutrition labeling. The agency intends to develop regulations for proper labeling and uses of medical foods in a future **Federal Register** document.

7. Reference amounts for products consisting of 2 or more foods having individual reference amounts

FDA proposed in § 101.12(f) that the reference amount for products packaged and presented to be consumed together (e.g., peanut butter and jelly combination, cracker and cheese pack, pancakes and syrup pack) be the sum of the reference amounts for the individual foods in the package.

140. FDA received only a few comments on this aspect of the proposal. Comments from nutrition professional organizations agreed with the proposal. A consumer organization disagreed with the proposal and stated that the proposal is reasonable only for foods that are not packaged in single-serve containers such as peanut butter and jelly. The comment contended that for foods in single-serve containers (e.g., cheese-and-cracker snack trays, yogurt and granola, pancakes and sausage, waffles and fruit sauce, spaghetti and tomato sauce,, macaroni and cheese, or rice with vegetables), the reference amount should be based on the weight of the entire package.

First of all, FDA wishes to clarify that the proposal applies to the products that contain two or more foods having individual reference amounts that are not listed in proposed § 101.12(b). Although this fact was mentioned in the preamble (56 FR 60394 at 60407), FDA did not state it in the codified language in proposed § 101.12(f). To clarify its intent, FDA has revised § 101.12(f) to read:

> The reference amount for products that represent two or more foods packaged and presented to be consumed together * * * shall be the sum of the reference amounts for individual foods in the package if the reference amount for the product is not listed in paragraph (b) of this section.

Some of the examples mentioned in the comment (spaghetti and tomato sauce, macaroni and cheese, rice with vegetables) are mixed dishes measurable with a cup that have reference amounts in new § 101.12(b). As explained previously, FDA does not believe that it is consistent with the act to have different reference amounts for the same product in different package sizes, one for single-serving packages and one for multiserving packages. The reference amount for the same product must be the same regardless of the package size.

In addition, the agency points out that the package of yogurt and granola is one food. It simply is another variety of flavored yogurt. Like frozen entrees in pouches, yogurt and granola are

packaged in separate containers for technical reasons (e.g., better preservation of the texture), but they are combined before consumption and eaten as one food. The reference amount for yogurt and granola is 225 g, the same as for any other yogurts.

141. An industry comment stated that the reference amount is not necessary for "meal-type" products because claims on these products will be evaluated on a per 100 g basis.

The agency disagrees with the comment. Reference amounts are also used to determine the label serving sizes of specific products for presenting nutrition information. Many "meal-type" products (reclassified and redefined as "meal product" and "main dish product" in the final nutrient content claims regulation published elsewhere in this issue of the Federal Register) (e.g., lasagna, pizza) are available both in single-serving and multiserving containers. Reference amounts provide a basis on which to determine the label serving sizes of these products in multiserving containers and whether these products are qualified to be called single-serving.

142. A consumer organization requested that FDA establish reference amounts for "frozen meals" (e.g., breakfast, lunch, or dinner trays) based on the average weight of the products in the marketplace or on the "industry-wide average."

The agency notes that the "frozen meals" mentioned in the comment currently come only in containers clearly intended for a single serving, and therefore, the nutrition information for these products will be based on the entire content of the package. The agency also notes that the reference amount is not needed to evaluate whether these products are qualified for claims because the qualification for claims on these products will be based on 100 g of the product and not on the reference amount as discussed in the final nutrient content claims regulation published elsewhere in this issue of the Federal Register. If a reference amount is needed for "frozen meals," new § 101.12(f) can be used to determine the reference amount for specific frozen meals. Breakfast, lunch, or dinner trays contain two or more distinct products which have reference amounts in new § 101.12(b). According to new § 101.12(f), the reference amounts of these products are the sum of the reference amounts of the individual foods in the tray. For example, the reference amount of a dinner tray containing fish, french fries, and mixed vegetables will be the sum of the reference amounts of fish (85 g), french fries (70 g if cooked), and mixed vegetables (85 g), i.e., 240 g. Therefore, there is no need to establish separate reference amounts for these "frozen meals."

8. Miscellaneous issues related to reference amounts

143. Some industry comments stated that restaurants should be permitted to declare nutrition information according to their own specifications for serving size.

Restaurant foods are not required to bear nutrition labeling. However, when nutrient content or health claims are made for restaurant foods, the restaurateur must provide nutrition information in compliance with the nutrient content or health claims regulations published elsewhere in this issue of the Federal Register. Meals, entrees, or other menu items served in restaurants are analogous to single-serving products. Therefore, in most cases, the restaurateur must have a reasonable basis for believing, based on the amount served, that the food qualifies for the claim. However, if nutrient content claims are made relative to a competitor's product, it is important that like amounts be compared.

144. A trade association recommended that FDA allow manufacturers to deviate from the reference amounts if such deviation is supported by food consumption data.

The act requires that FDA establish standards providing that uniform serving sizes information will be furnished on the food label (H. Rept. 101–538, supra, 7). The reference amounts are part of the standards. Manufacturers cannot deviate from the reference amount simply because they believe that such deviation is supported by food consumption data. If the uniformity expected by Congress is to be maintained, the information on the need for revised or separate reference amounts must be evaluated by FDA through the petition process that it has established in new § 101.12(h) before changes in, or deviations from, the reference amounts can occur.

E. Procedures for Converting the Reference Amount to Serving Size

For the purpose of converting the reference amounts for multiserving products into label serving sizes, FDA grouped these products into three categories according to the shape and characteristics of products and the way products are usually served. The three categories were: (1) Products in discrete individual units (e.g., muffin, sliced bread, apple), (2) products in large discrete units that are usually divided for consumption (e.g., cake, pie, pizza, melon, cabbage), and (3) nondiscrete bulk products (e.g., breakfast cereals, flour, sugar). The agency proposed separate procedures for each category to ensure that the serving size declared on the label is most appropriate for the specific type of product.

FDA received about 20 comments on issues related to these procedures. About one-third of the comments agreed with the proposed procedures. The remaining two-thirds suggested other ways of determining label serving sizes for specific products or requested modification or clarification of certain specific aspects of the procedures. FDA will first respond to the "general" types of comments and then discuss the comments on procedures for each specific category.

145. A foreign manufacturer stated that the reference amounts should be used only to ascertain that the serving size chosen by the manufacturer is reasonable, and that they should not be used to determine the label serving size. The comment argued that products packed in foreign countries are packaged according to "whole number" metric amounts and do not translate easily into U.S. household units. The comment requested that FDA show a certain amount of flexibility. A domestic comment stated that several of the reference amounts are "atypical in retail practice" in the United States even though they may represent consumers' consumption practice. The comment, therefore, suggested that FDA permit industry to use the reference amount as a guideline and require them to justify, with marketing data, those serving sizes that substantially deviate from the reference amount. A few consumer comments, on the other hand, requested that FDA not allow the manufacturers to deviate from the "standard serving size."

The 1990 amendments direct FDA to establish standards, not guidelines, to define serving sizes. As alluded to above, the House report on the 1990 amendments, in explaining section 2(b)(1)(B) states: "It is critical to the successful implementation of this legislation that the FDA develop meaningful serving size requirements * * *." (H. Rept. 101–538, supra, 18). Accordingly, FDA established the standards described above to define how to determine the label serving size that is most appropriate for a specific product. FDA believes that the standards provide enough flexibility to both domestic and foreign manufacturers to permit them to determine the serving sizes most

appropriate for their products from the reference amounts in new§ 101.12(b).

FDA does not agree with the comment that products packaged in foreign countries according to "whole number" metric amounts cannot easily be translated into common U.S. household measures. Some domestic products are also packaged according to "whole number" metric amounts (e.g., 1- or 2-liter (L) bottles of soft drinks). FDA allows the number of servings per container to be expressed in an approximate number. Therefore, it should not be difficult to translate the products packaged according to "whole number" metric amounts into common U.S. household measures. For example, the serving size and the number of servings for a 1–L container of soft drink can easily be translated to the common U.S. household measure by dividing the 1-L (1,000 mL) net quantity of the product by the 240-mL reference amount for soft drinks and expressing an approximate number of servings, e.g., serving size: 1 cup (240 mL); number of servings per container: about 4.

FDA notes that the act links serving size to food consumption practices, not to the "typical retail practice" or marketing data. Therefore, FDA cannot use information (e.g., "typical retail practice" or marketing data) other than food consumption data as the primary basis for reference amounts when appropriate food consumption data are available. The agency has considered serving sizes used by the industry (i.e., retail practice) in developing the reference amounts in this final rule. When appropriate food consumption data were not available, the agency gave more weight to other information listed in new § 101.12(a)(5), including serving sizes currently used by the industry, in arriving at the reference amount.

146. An industry comment asked that FDA clarify how to determine the label serving size if there are more than one use of a product.

The reference amounts in new § 101.12(b) reflect the major usage of the products in each product category. If there is more than one use for a product, manufacturers should use the major usage of the product to determine the label serving size. For example, the label serving size for a cake mix which has directions for a 2-layer cake and cupcakes should be based on the 2-layer cake. Manufacturers should determine the major usage of the product based on food consumption data, marketing survey data on the consumer usage of the product, or, in the case of a new product, promoted use.

147. An industry comment requested that FDA clarify how to determine the label serving size if the label serving size determined according to the procedures in proposed § 101.9(b)(2) and the incremental rules in proposed § 101.9(b)(5) falls exactly half way between two sizes, e.g., exactly 2.5 tbsp.

FDA notes that the common standard procedure for rounding is to round up values 0.5 or larger. FDA is not aware of any reason not to follow this procedure. Therefore, for clarity, FDA has added a new § 101.9(b)(5)(v), on rounding rules as follows:

> When a serving size, determined from the reference amount in § 101.12(b) and the procedures described in this section, falls exactly half way between two serving sizes, e.g., 2.5 tbsp, manufacturers shall round the serving size up to the next incremental size.

148. Several comments suggested different serving sizes for celery or for other of the 20 most frequently consumed raw fruits and vegetables identified in § 101.44.

FDA advises that serving sizes for the 20 most frequently consumed raw fruits and vegetables, including celery, are provided in Appendix A to the regulation entitled "Food Labeling; Guidelines for Voluntary Nutrition Labeling; and Identification of the 20 Most Frequently Consumed Raw Fruits, Vegetables, and Fish; Definition of Substantial Compliance" (56 FR 60880 as amended at 57 FR 8174, March 6, 1992). Retailers who wish to use different serving sizes for these fruits and vegetables may do so subject to the provisions of § 101.45. FDA urges such retailers, and retailers who wish to provide the nutrition information of raw fruits and vegetables not included in § 101.44, to use the reference amount specified in new § 101.12(b) for the fruit or vegetable category appropriate for the specific fruits or vegetables and to follow the procedures described in this section to determine the label serving size.

1. Products in discrete individual units

FDA proposed in § 101.9(b)(2)(i) that "for products in discrete units (e.g., muffin, sliced bread, apple), the serving size shall be the number of units that most closely approximates the reference amount for the product category. If a unit weighs 67 percent or more, but less than 200 percent, of the reference amount, the serving size shall be one unit. If a unit weighs 200 percent or more of the reference amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion."

149. Several industry comments opposed the lower limit of the single-serving unit because single units of many products in discrete units weigh less than 67 percent of the reference amount. One comment requested changing the lower limit from 67 percent to 50 percent because food consumption data (e.g., 1977–1978 NFCS) show that a significant proportion of "eatings" (e.g., up to 25th percentile) were about one-half or less of the average quantity consumed. Therefore, the comment contended, a unit that weighs 50 percent of the reference amount should be able to declare one serving per unit. Another comment requested changing the lower limit from 67 percent to 50 percent and allowing single-serving declaration on a single unit that weighs less than 50 percent of the reference amount if a single unit can reasonably be consumed at a single-eating occasion. The latter comment stated that this approach is analogous to the optional declaration as a single serving of a single unit that weighs 200 percent or more of the reference amount if the whole unit can reasonably be consumed at a single-eating occasion. Some comments recommended that FDA let the manufacturers determine whether a unit that weighs less than 67 percent is a single serving.

FDA carefully examined all requested changes for the lower limit of a single-serving unit. The agency has examined the amount of food consumed per eating occasion for several products that come in discrete units and find that a significant number of people consume between 50 and 67 percent of the reference amount per eating occasion (Ref. 63). Considering that: (1) Many single units fall between 50 and 67 percent of the reference amount, (2) a significant number of people consume between 50 and 67 percent of the reference amount per eating occasion, and (3) serving sizes in dietary guidance documents are often based on a single unit, FDA believes that it is reasonable to let manufacturers have the flexibility to determine whether a unit that weighs more than 50 percent but less than 67 percent is a single serving. However, a unit that weighs 50 percent of the reference amount is, by definition, one-half of a serving, not one serving. Therefore, products that weigh 50 percent or less cannot be called one serving. Accordingly, FDA has revised § 101.9(b)(2)(i) to allow optional declaration of a serving based on a single unit of a product if the unit weighs more than 50 percent but less than 67 percent of the reference amount.

150. Several industry comments requested that FDA permit the use of an oz measure for the serving size for products that naturally vary in piece

size (e.g., shrimp, pickles) instead of the number of discrete units. A seafood trade association stated that great difficulty and financial burden would be placed on the industry if serving sizes of seafoods have to be expressed in the number of discrete units. The comment pointed out that seafoods such as shrimp, scallops, oysters, clams, lobster, and fillet of fish vary naturally and substantially in size. For example, processed breaded shrimp products are made in as many as 12 to 15 sizes because of the natural variation in shrimp size. The comment stated that if a manufacturer packed these products in three different sized packages, up to 45 different labels would be necessary to accurately designate serving sizes based on discrete units, and the cost of printing different labels would be prohibitive.

A pickle trade association also stated that the size and shape of cucumbers naturally vary widely because of numerous factors, including the variety, weather conditions, and maturation when harvested. Therefore, according to the comment, pickles, even in the same grade established by the USDA, vary considerably in size and weight. The comment contended that the serving size cannot be declared by the number of pickles because of the inherent variability in pickle sizes. If the serving size of pickles were required to be declared in the number or fraction of pickles, the comment continued, pickle manufacturers would have to have a different label for each pickle size. The comment contended that such a result would represent an unnecessary burden and cost. Therefore, the comment recommended that the serving size for pickles should be declared in terms of oz.

FDA recognizes the wide variability in the unit size of seafoods and agricultural commodities such as pickles where the size is determined by nature, not the manufacturer. The costs incurred in ensuring that the number of discrete units in the serving size declaration for these naturally-variable products is appropriate would be unreasonable because of the numerous labels for each product size, and the costs would likely be passed on to the consumer. The agency, therefore, believes that the most reasonable solution to this problem is to express the serving size in an oz measure most closely approximating the reference amount, followed by the g equivalent weight and the approximate number of pieces for small pieces (e.g., shrimp) or the dimension for a large piece (e.g., fillet of fish) in parenthesis. For example, serving sizes may be declared as 3 oz (84 g/about 5 shrimp) for cooked shrimp, 3 oz (84 g/about one fillet) for cooked fish fillet, 1 oz (28 g/about 1 pickle) for small pickles, and 1 oz (28 g/about 1/2 pickle) for large pickles. This approach will satisfy the act by providing the declaration in household measures in terms of oz. It also provides a uniform g weight within and across brands. This approach also facilitates nutrition comparisons among brands. Because many consumers stated that they do not understand oz measure, the approximate number of pieces or the dimension allows consumers to visualize the serving size in more easily identifiable units. Therefore, FDA has revised § 101.9(b)(2)(i) to exempt products that vary naturally in the unit size such as pickles, shellfish, whole fish, and fillet of fish. In addition, the agency has added a statement that serving sizes for these products shall be expressed in the amount in oz that most closely approximates the reference amount for the product category, and a second statement that refers manufacturers to § 101.9(b)(5) for instructions on how to express the serving size in oz. The agency notes that this exemption does not apply to processed products, such as fish sticks and fish squares, where manufacturers can control the piece size.

FDA recognizes that unit sizes of products in individual discrete units (e.g., fish sticks, muffins, sliced products) for which the size of the product is controlled by the manufacturer, not by nature, also vary somewhat from unit to unit within the package as well as from batch to batch for the same container size. This variation is also true for products in large discrete units (e.g., cake, pizza). Therefore, the g weight of a unit or a fraction will vary from unit to unit as well as from batch to batch. It is thus impossible to label accurately the g weight that is equivalent to the household measure in each package. FDA concludes that the most reasonable solution for this problem is to state the average g-weight equivalent of the unit or the fraction that represents the serving size. To determine the average g-weight equivalent of the household measure, manufacturers must follow the sampling procedures in § 101.9(g)(2) for nutrient analysis. The g-weight equivalent of a unit or a fraction for each package can be determined by dividing the net weight of the package in g by the number of units or fractions in the package or by actually weighing the units or the fractions. In determining the average g-weight equivalent, the measurements should be replicated a sufficient number of times to ensure that the average of the measurements is truly representative of the g-weight equivalent of the serving size in household measure. FDA urges manufacturers to maintain records of all data and calculations used to determine the average g-weight equivalent to substantiate the parenthetical metric quantity declared on the label.

151. A comment from a maraschino cherry trade association stated that according to the 1991 serving size proposal, the serving size for maraschino cherries would be 1 cherry. However, maraschino cherries naturally vary in size ranging from 4 g for a small cherry to 7 g for a large cherry depending of the locality of growth and the crop year. The comment contended that because of this natural variation in the size of cherries, the maraschino cherry packers would have to keep changing the labels to have the accurate serving size information. In addition, the comment stated that the number of servings per container vary because of the variation in the cherry size. The comment requested that FDA allow the maraschino cherry packers to use a range of values (e.g., 4 to 7 g) for the parenthetical metric measure for the serving size and exempt the maraschino cherries from the declaration for the number of servings per container.

As for pickles, FDA recognizes the wide variability in the unit size of agricultural commodities where the size is determined by nature, not the manufacturer. As stated above, the costs incurred in ensuring that the number of discrete units in the serving size declaration would be unreasonable because of the numerous labels necessary for each product size. Unlike pickles, however, cherries cannot have a serving size expressed in oz because the reference amount for cherries (4 g) is too small to express in oz. Therefore, the agency finds that the most reasonable solution to this problem is to declare the serving size as one cherry and the parenthetical metric measure as the g-weight equivalent of one medium cherry (e.g., 1 cherry (5 g)). The number of servings per container would then be declared as the usual number of servings per size of container (e.g., usually 20 servings), and the nutrition information would thus be provided for one medium cherry. The agency recognizes that different size containers hold different numbers of cherries. Therefore, this approach will require the manufacturer to have one set of labels for each size of container. Accordingly, new § 101.9(b)(2)(i) has been further revised to include the special serving

size requirement for maraschino cherries.

152. Several industry and professional comments stated that the serving size for products in discrete units (e.g., sliced bread, frozen novelties) should be one unit.

FDA disagrees with the comments. Products in discrete units vary widely in unit size. For example, the unit size for sliced bread varies from about 0.3 oz to 1.2 oz and from 0.4 oz to 6 oz for muffins. If one unit were defined as the serving size, there would be no uniformity in the serving sizes for products in discrete units. Furthermore, single units of some of these products are too small to be reasonably considered a serving.

The act defines serving size as an amount customarily consumed. Reference amounts established by this regulation represent FDA's best estimate of the amounts customarily consumed for the 139 product categories. To provide flexibility and to ensure that the serving size in common household measures is meaningful for specific types of products, FDA has provided procedures in new § 101.9(b)(2) to convert the reference amounts to the label serving size. Therefore, unless one unit represents the serving size for the product as determined from the reference amount in new § 101.12(b) using the procedures in new § 101.9(b)(2), one unit cannot be used on the labels as the serving size.

153. Some comments requested that FDA clarify serving sizes of packages within packages.

FDA advises that packages within a package (i.e., individually wrapped products in a multiserving container) are considered to be products in discrete units. Each individually wrapped package (e.g., fun size candy bars, roll candies, tiny box of raisins) is one unit. The serving size of these products is the number of individual units whose total net content most closely approximates the reference amount. FDA has revised § 101.9(b)(2)(i) to clarify this point by adding individually packaged products within a multiserving package to the list of examples of products in discrete units.

154. A manufacturer suggested that FDA change the single-serving unit criteria from "67 percent or more, but less than 200 percent" of the reference amount to "2/3 or more, but less than twice" the reference amount. The comment asserted that this modification would avoid a difference of opinion as to whether 66.67 percent should be rounded to 67 or should be considered less than 67 percent for a single-serving determination.

As discussed earlier, the common standard procedure for rounding is to round up values 0.5 or larger. Thus, 66.67 percent is considered to be 67 percent. Therefore, defining the lower cutoff point as 67 percent is as clear as defining it as 2/3, and defining the upper limit as less than 200 percent is as clear as defining it as less than twice. Since the proposed language and the suggested change are equally clear, the agency has concluded that it is not necessary to modify the proposed regulatory language. Accordingly, FDA has retained the language for the single-serving unit criteria as proposed.

155. A consumer organization requested that FDA clarify whether, for products in discrete units, manufacturers must list the nutrition information on the basis of units that constitute the label serving size (e.g., 2 slices) or for the underlying reference amount (e.g., 2 1/2 slices). The comment contended that FDA should require nutrition information for products in discrete units to be listed based on the former approach.

FDA agrees that clarification is needed. Accordingly, the agency is revising § 101.9(b)(2)(i) to state that, except for products that naturally vary in size, the serving size of discrete-unit products is the number of whole units that most closely approximates the reference amount for the product category. This revision makes it clear that the serving size is to be expressed in whole number of units which was the original intent in the proposal.

156. A manufacturer requested that FDA clearly state in the preamble to the final regulation that a slice of cheese, whether or not wrapped individually, like sliced bread, constitutes a discrete unit for purposes of determining serving size. The manufacturer stated that this fact was evident, but ambiguous, in light of specific examples of discrete units cited in the 1991 serving size proposal.

Because it is impossible to provide the entire list of the products that are sold in discrete units, FDA provided a few examples of products that are sold in discrete units in § 101.9(b)(2)(i) of the 1991 serving size proposal. They included muffins, sliced bread, and apples. The specific examples given in the 1991 serving size proposal were to provide some idea of what is meant by products in discrete units. The agency included "sliced bread" as an example to convey the message that a slice of sliced products is a discrete unit product. A slice of sliced cheese is thus a discrete unit product. For clarity, FDA has modified the "sliced bread" example to read "sliced products such as sliced bread."

2. Products in large discrete units that are usually divided for consumption

FDA proposed in § 101.9(b)(2)(ii) that for products in large discrete units that are usually divided for consumption (e.g., cake, pie, pizza, melon, cabbage), the serving size is the fractional slice of the food (e.g., 1/12 cake, 1/8 pie, 1/4 pizza, 1/4 melon, 1/6 cabbage) that most closely approximates the reference amount for the product category.

157. A manufacturer recommended that the fractional slice should be "geometrically friendly" to consumers. The comment stated that some fractional slices may not be easy for the consumers to cut or visualize. For example, a cake cannot be easily cut into seven even slices. The comment provided two separate lists of "geometrically friendly" fractions in support of their position, one "for products that are not cut in two directions" (e.g., round cakes) and one for "products that must be cut in two directions" (e.g., sheet cakes). A few other comments also expressed a concern about odd fractional serving sizes.

FDA recognizes that the proposal could result in an odd fractional slice such as 1/7 of a cake or pie. The agency agrees with the comment that the serving size for products in large discrete units should be expressed in fractions friendly to consumers. Although manufacturers may have a means to cut these products in odd fractions, consumers generally would have difficulty in cutting them into certain odd fractions such as 1/7.

To rectify this problem, the agency carefully examined all possible fractional slices including those suggested in the comment. FDA could not directly adopt the two sets of fractional schemes suggested in the comment because the agency cannot require that some products be cut in one direction and others in two directions. Contrary to the assumption in the comment, some large, round cakes are often cut in two directions. The fractional list provided by the manufacturer was also inconsistent in that it suggested that a square cake could not be divided into five pieces but listed 1/20, which is a multiple of 5, as "geometrically friendly" for a square or rectangular product.

For the reasons outlined above, FDA cannot directly adopt the list of fractions suggested by the comment. However, the agency agrees with the concept of friendly fractions and is responding to the spirit of the comment by adopting a two-part scheme for identifying them. The scheme involves

establishing a base set of fractions and describing a process for generating a continuing set of smaller divisions of the base set. For the base set, FDA has selected integer increases of fractions up to and including 6 (1/2, 1/3, 1/4, 1/5, and 1/6). The agency has not included 1/7, which both FDA and the comment recognize would be difficult to cut and which the comment did not include in either of it's suggested lists. This base set is consistent with the comment's list of fractions for round products but not for square and rectangular products, which excluded 1/5 as geometrically unfriendly. The agency acknowledges that dividing a product into five pieces is more difficult than other fractions in the base set. However, the difference between a serving size of 1/4 and 1/6 of a product is substantial and therefore could result in a serving size that is too large or too small. The comment also included 1/5 as a friendly fraction for round products. Thus, the agency has included a 1/5 fraction to provide a more reasonable serving size for products that contain between 450 and 550 percent of the reference amount.

The process for generating a continuous set of friendly fractions is based on creating further divisions of the base set. FDA and the comment both agree that it is easy to divide objects into two or three pieces. Therefore, the process selected for generating additional fractions involves dividing any of the base set or any newly created fractions by 2 or 3. Thus under this scheme, the set of friendly fractions includes 1/2, 1/3, 1/4, 1/5, 1/6, 1/8, 1/9, 1/10, 1/12, 1/16, 1/18, 1/20, 1/24, 1/32, 1/36, etc. The only fraction included in the comment list and not included here is 1/28 because it involves a division by 7 and that was not acceptable to the comment or FDA. Therefore, the agency excluded 1/28 from the friendly fractions.

To incorporate the friendly fractions in the regulations, FDA has revised § 101.9(b)(2)(ii) to read: "For products in large discrete units that are usually divided for consumption * * * the serving size shall be the fractional slice of the food * * * that most closely approximates the reference amount for the product category. In expressing the fractional slice, manufacturers shall use 1/2, 1/3, 1/4, 1/5, 1/6, or smaller fractions that can be generated by further division by 2 or 3."

F. Declaration of Serving Size on the Product Label

1. Label statement of serving size

FDA proposed in § 101.9(b)(7) that a label statement regarding a serving shall be the serving size expressed in common household measures followed by the equivalent metric quantity in parenthesis. In addition, FDA proposed that serving sizes may be declared in oz and fl oz (U.S. measure), in parenthesis, following the metric measure where other common household measures are used as the primary unit for serving size, e.g., 1 cup (28 g)(1 oz).

158. Over 100 comments addressed this issue. The majority supported the use of common household measures as the primary unit for the serving size. About one-third of the comments agreed that the equivalent metric quantity should be required, and that manufacturers should be allowed to voluntarily list the equivalent U.S. measure. Comments disagreeing with the proposal varied widely as to how serving sizes should be stated.

Several comments stated that the U.S. measure should be mandatory in addition to or instead of the metric measure. Others objected to voluntary declaration of the U.S. measure in addition to the common household measure, arguing that it was unnecessary, would crowd the label, and would be confusing to consumers. However, none of the comments presented any supporting data or evidence.

Several comments opposed the use of the metric measure arguing that U.S. consumers are not familiar with metric measurements, that a g is not commonly used in food preparation, and that declaration of the exact metric weight might mislead consumers by implying an accuracy that is often unachievable for food products. Some suggested making the metric measure optional. Other comments favored allowing only one of the three measures; some of these expressed no preference and others specifically supported one of the three. However, many comments from professional organizations and consumers supported listing the metric measure parenthetically. These comments noted that the world is progressively moving toward the metric system, and it is important for Americans to become familiar and feel comfortable with metric measurements. They stated that using metric measurements to declare serving sizes would educate consumers about the metric system.

The 1990 amendments require that serving size be expressed in a common household measure that is appropriate to the specific food. The Omnibus Trade and Competitiveness Act of 1988 (Pub. L. 100–418) declares that the metric system is the preferred measurement system for U.S. trade and commerce. Federal agencies are required to use the metric system in procurement, grants, and other business-related activities to the extent economically feasible by the end of fiscal year 1992. As discussed in the 1991 serving size proposal, FDA needs a precise quantity statement (e.g., metric measure), in addition to the common household measure, for compliance purposes because of the variability in the quantity of different brands in common household units. After carefully considering the statutory requirement, the Omnibus Trade and Competitiveness Act of 1988, the need for a compliance measure, and the arguments presented in the comments, FDA concludes that the most straightforward way to comply with the law, to fulfill the agency's regulatory needs, and to make the label most useful to consumers is to require the serving size to be declared in common household units followed by the equivalent metric quantity in parenthesis as proposed in the 1991 serving size proposal.

Given the conflicting views in comments on the use of the U.S. measure, the agency has decided to make the listing of the equivalent U.S. measure after the metric measure voluntary. Because of consumers' familiarity with U.S. measures, this declaration is likely to help consumers understand the serving size. However, because its use is voluntary, there is no reason to believe that it will create a crowding problem. Manufacturers will only include this information if they have ample label space. Accordingly, FDA is retaining in new § 101.9(b)(7) the requirement that the label serving size be expressed in common household measures, followed by the metric quantity in parentheses.

159. An industry comment stated that the parenthetical listing of the equivalent metric weight of the serving size is unnecessary on those single-serving containers for which the metric weight of the net quantity of contents is provided on the principal display panel. The comment requested that single-serving containers be exempted from this requirement. The comment contended that the parenthetical metric statement unnecessarily uses valuable label space for small single-serving containers.

FDA agrees that the parenthetical listing of the equivalent metric quantity is not necessary on the single-serving containers when the metric quantity of the net quantity of contents is provided on the principal display panel. However, for some products the metric quantity for the serving size and the metric quantity for the net quantity of

contents may differ. For example, the serving size for products packed or canned in liquid that is not customarily consumed (e.g., canned fish, pickles) must be expressed on a drained weight basis. In this case, the metric quantity on the principal display panel, which includes both the solids and the liquid, may differ from the parenthetical metric quantity for the serving size, which is based on the drained solids only. Thus, FDA has concluded that it is reasonable to exempt single-serving containers from the requirement for listing the parenthetical metric measure but only if the metric quantity for the net quantity of contents is the same as the metric quantity for the serving size. Accordingly, FDA has revised § 101.9(b)(7) to reflect this conclusion.

160. An industry comment stated that because individual products that belong to the same category, and thus have the same reference amount, vary in size and shape, the parenthetical metric measure equivalent to the serving size in household measure can vary from brand to brand. For example, g equivalents of 1/4 cup of nuts may vary from 30 g to 40 g. Thus, different metric equivalents can be declared by different brands for the same product. One brand may declare 30 g as the metric equivalent and present the nutrition information based on the 30 g serving, and another brand may declare 40 g as the metric equivalent and present the nutrition information based on the 40 g serving. The comment stated that this result is confusing and invites manipulation of the metric equivalent of the household measure. The comment recommended that FDA standardize the metric quantity of the reference amount for bulk products and have manufacturers declare an approximate household measure that is closest to that reference amount (e.g., about 1/4 cup (30 g)). Several other industry comments stated that there is no standard procedure for determining g equivalents of household measure, and that it is difficult to measure the g weight of a household measure accurately.

FDA recognizes that the parenthetical metric equivalents of the household measure of the same food may differ for different brands due to the differences in the products' size and shape. However, the agency notes that the 1990 amendments provided FDA with the authority to establish the standards to define serving sizes, not specific label serving sizes. Standardizing the parenthetical metric quantity on the reference amount is like using the reference amount (standard) as the label serving size. Therefore, FDA rejects this request.

However, the agency recognizes that the procedure for determining metric equivalents of household measures needs to be standardized, and that there is no well-established standard procedure used by industry or any other organization for doing so. To promote uniformity in label serving sizes in household measures of the same food declared by different manufacturers, the agency is providing Guidelines for Determining the Gram Weight of the Household Measure. The guidelines can be obtained from Division of Nutrition (HFF–260), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

161. An industry comment requested that FDA allow voluntary labeling of the number of pieces in addition to the serving size in oz for products such as chips and nuts.

FDA agrees that oz is an appropriate household measure for chips. The agency points out that new § 101.9(b)(5)(iii) requires an appropriate visual unit of measure when oz is used as the serving size. Therefore, manufacturers must provide a visual unit of measure, such as the number of chips or a fraction of the package (e.g., 1/4 package), that is equivalent to the oz amount declared.

FDA does not agree that oz is the common household measure most appropriate for nuts. The agency believes that cups is the appropriate household measure for most nuts because most nuts are small in size and can be measured with a cup. When cups are used to express the serving size for nuts, the parenthetical statement for the number of nuts is not required. However, the agency does not object to a manufacturer voluntarily providing an additional visual measure such as the number of nuts, which may help consumers better visualize the serving size. For some exceptionally large nuts that are hard to measure with a cup (e.g., unshelled walnuts), the agency believes the number of nuts would be the most appropriate household measure.

162. A trade association expressed concern that the use of several parentheses (e.g., 1 slice (28 g) (1 oz)) would make the serving size statement more difficult to understand. The comment recommended that FDA allow the flexibility to use commas and slashes.

FDA disagrees with the comment. Allowing such flexibility would result in nonuniformity in the declaration of label serving sizes by different manufacturers. For example, the serving size for sliced breads could be expressed in five different ways: 1 slice (28 g) (1 oz) by brand A; 1 slice (28 g, 1 oz) by brand B; 1 slice (28 g/1 oz) by brand C; 1 slice, 28 g, 1 oz by brand D; and 1 slice/28 g/1 oz by Brand E. The use of these various formats for this declaration would be confusing.

After examining all possible combinations of the formats, FDA finds that the most desirable format is to require the presentation of all serving size information other than the mandatory common household measure, in one set of parenthesis with the different serving size statements separated by slashes, i.e., 1 slice (28 g/1 oz). This format requires less space than most of the other formats and separates the household measure from the rest of the information. Therefore, FDA has modified § 101.9(b)(7) to require that all serving size information, other than the mandatory common household measure, be presented in one set of parenthesis with the different serving size information separated by slashes.

163. An industry comment stated that the label statement example given in proposed § 101.9(b)(7) is confusing because there is no indication of the product for which the example applies.

FDA has revised § 101.9(b)(7) to correct this oversight by adding a phrase indicating what product was used for the example.

164. Several comments recommended that FDA allow voluntary listing of nutrient contents per unit for products that come in discrete units (e.g., 1 slice of bread, 1 doughnut, 1 ice cream bar), when the declared serving size of a multiserving package is more than one unit. These comments stated that: (1) Per-unit nutrition information would aid nutrition professionals in providing dietary guidance to their clients, and (2) although two or more units are determined to be the label serving size according to the FDA regulation, these foods are clearly meant to be consumed one unit at a time. The comments said that per-unit nutrition information will thus help consumers to better understand the nutrient content of the food as consumed.

Because many products in discrete units come in small units, and people customarily consume more than one unit per eating occasion, reference amounts of these products are in multiunits (e.g., 2 small doughnuts). However, FDA recognizes that some individuals may consume only one unit at a time. In addition, the serving sizes contained in some dietary guidance or nutrition education documents (e.g., diabetic exchange list) are often expressed in terms of a single unit. In

an attempt to make the nutrition information on these products more useful to those consumers who consume only one unit at a time and to nutrition professionals who provide dietary guidance to their clients, the agency has revised § 101.9(b)(10) to allow voluntary labeling of a second column of nutrition information on a per unit basis. Finally, for individuals who consume multiple units that differ from the label serving size, the per-unit labeling would facilitate calculating the nutrient content for any multiple of a single unit.

However, products in discrete units vary greatly in size. Also, "mini" or "bite" size versions (e.g., "mini" cookies) are gaining popularity in the marketplace. FDA believes that per unit nutrition information on some of these products would be misleading. For example, a "bite" size version of a product could be labeled as containing zero fat or calories because of FDA's round-off rules for nutrient declaration, when in fact, enough units to constitute a serving contain significant amounts of fat and calories. The agency, therefore, considers that per unit labeling of "mini" or "bite" size products is misleading. FDA will consider regulatory action under section 403(a) of the act for any misuse of this allowance.

165. An industry comment recommended that the serving size declaration should conform to the rules for the net quantity of contents in § 101.105.

Most rules in § 101.105 do not apply to the serving size regulation. The applicable portion of the net quantity rule has been incorporated in the Guidelines for Determining the Gram Weight of the Household Measure mentioned in new § 101.9(b)(7).

2. Definition of household measures

FDA proposed in § 101.9(b)(5) to define "common household measure" or "common household unit" to mean cup, tbsp., tsp., piece, slice, fraction (e.g., 1/4 pizza), oz, or other common household equipment used to package food products (e.g., jar, tray).

166. One comment recommended that units other than those listed in proposed § 101.9(b)(5) be allowed to be used for a common household measure, e.g., 1 cake for single-serving cakes, 1 bar for frozen novelties, and 1 sandwich for sandwiches.

FDA advises that new § 101.9(b)(5)(ii) allows the use of 1 cake, 1 bar, 1 sandwich, and similar units for label serving sizes. These units are examples of "piece" measurements for specific products. FDA listed them as a generic term "piece" because it is not possible to name all common household measures appropriate for specific products in discrete units.

167. Because all beverages can be measured with a cup, the proposed definition for the household measure did not include fl oz. Some comments stated that it would be helpful to have fl oz measures for liquids. Although many consumer comments stated that they do not understand oz measures, they stated that fl oz is known and understood. The comments suggested that parts of the public want fl oz as a measure for expressing serving sizes.

FDA notes that fl oz is a common measure used to express the serving sizes of beverages. Therefore, on the basis of the comments, the agency concludes that it is appropriate to include fl oz in the definition of common household measures. Accordingly, FDA has revised § 101.9(b)(5) to include fl oz as a household measure. In addition, § 101.9(b)(5)(i) has been modified to allow beverages to express the primary household measure in fl oz.

3. Rules for declaring household measures

168. FDA proposed in § 101.9(b)(5)(i) through (b)(5)(iv) a set of rules that manufacturers should follow in expressing serving sizes in household measures. Most comments agreed with the proposed rules. One comment, however, stated that some foods would be more precisely measured in 1/3 cup increments rather than 1/4 cup increments and requested that this option be added to the final rule.

FDA proposed to require that cup measurements be declared in 1/4 cup increments to assure as much uniformity as possible in label serving sizes within a product category. Without such a rule, one manufacturer may choose to use 1/3 cup as the serving and another manufacturer may choose to use 1/4 cup for similar quantities of products. To prevent such inconsistencies in serving sizes, the agency proposed to require that cup measures be expressed in 1/4 cup increments. FDA has reexamined this aspect of the proposal. The agency agrees with the comment that some foods can be measured more precisely in 1/3 cup increments. In addition, FDA recognizes that contrary to the agency's intention, 1/4 cup increments may result in a larger discrepancy in label serving sizes of different brands or contribute to the manipulation of serving sizes when the label serving size is on the borderline between two sizes. One manufacturer may declare 1/4 cup and another manufacturer may declare 1/2 cup for similar quantities of a product. Therefore, FDA has concluded that adding 1/3 cup increments to the final rule is desirable. Accordingly, FDA has revised § 101.9(b)(5)(i) to read: "Cups, tablespoons, or teaspoons shall be used wherever possible and appropriate except for beverages. * * * Cups shall be expressed in 1/4 or 1/3 cup increments, * * *."

169. Because common household measures such as cups, tbsp., and pieces may not be appropriate for some foods, FDA proposed in § 101.9(b)(5)(iii) the use of oz as the common household unit for such foods. When oz is used as the common household measure for serving size, FDA proposed that the oz statement should be accompanied by an appropriate visual unit of measure such as a dimension of a piece (e.g., "about 1 inch slice" for unsliced bread). An industry comment objected to the proposed requirement for an appropriate visual unit of measure. The comment stated that oz is a unit of measure that is understood by the public, and that the parenthetical dimensional measurement will only confuse the consumers. The comment did not submit any data to support its claim.

FDA disagrees that oz is a unit of measure well understood by the public. Consumer comments on the 1990 proposal overwhelmingly opposed the oz measure for serving sizes. They stated that they did not understand the oz measurement very well, and that they did not have a scale to measure food. They preferred common household measures such as cups, tbsp., and pieces. Several consumer comments on the 1991 serving size proposal again stated that they did not understand oz measurement. Therefore, FDA rejects the industry comment. Based on the comments, the agency concludes that when the oz measurement is used as the primary unit for serving size, an appropriate visual unit of measure is needed to help consumers visualize the serving size. Accordingly, FDA has retained the requirement for an appropriate visual unit of measure. However, FDA has revised § 101.9(b)(5)(iii) to permit the use of a fraction as a visual unit if it is the appropriate unit.

170. FDA stated in § 101.9(b)(5)(iii) that when oz is used as the common household measure for serving size, the oz measurements must be expressed in 0.5-oz increments most closely approximating the reference amount, with rounding indicated by use of the term "about" (e.g., about 2.5 oz).

A manufacturer recommended that oz measures should be rounded to the nearest 0.1-oz increment. The

manufacturer stated that since an appropriate visual unit of measure is required, there is no need to round the oz measure to the nearest 0.5 oz. The comment contended that when consumers complained about fractional numbers, it is because they have no means of visualizing what quantity the weight represents. Therefore, as long as they have a visual description, consumers would not object to fractions. The comment further stated that under the proposal, products weighing from 22 to 35 g would all be listed as "about 1 oz." In addition, a product with an exact serving size of 64 g would declare "about 2.5 oz" whereas a product with an exact serving size of 63 g would declare "about 2 oz." The manufacturer stated that it would be a disservice to metric education in this country if people thought that a 1 g difference was a 1/2 oz difference. Because listing g quantities will be mandatory, the manufacturer felt that more exact oz measures need to be used, e.g., in increments of 0.1 oz.

FDA advises that the proposed § 101.9(b)(5)(iii) applies to the oz measure when it is used as the primary serving size. It does not apply to the parenthetical oz measure equivalent to the metric measure that is provided voluntarily by the manufacturer (see § 101.9(b)(7)). The nonuniformity in the oz measure described in the comment (i.e., about 2 oz for 63 g and about 2.5 oz for 64 g) would not occur when oz is used as the primary serving size because in determining the reference amounts, FDA made sure that the values would be in 0.5-oz increments. However, in expressing the reference amounts in g, FDA rounded the g quantity to the nearest 5 g for quantities. Therefore, some reference amounts will not convert to exactly 0.5-oz increments. For example, 30 g reference amount would be translated to about 1.1 oz. To prevent the use of odd decimals and unusually accurate fractional numbers for the primary serving size, the agency proposed to require in § 101.9(b)(5)(iii) that oz measures be expressed in 0.5-oz increments. When oz is used as the primary serving size, the main purpose is to be a reference for consumers. Comments from consumers have strongly objected to odd decimals and fractions (55 FR 29517 at 29524, July 19, 1990) (56 FR 60394 at 60411, November 27, 1991). Therefore, the agency concludes that the primary serving size should be expressed in 0.5-oz increments to be meaningful to consumers. Accordingly, FDA has retained the 0.5-oz incremental rule in § 101.9(b)(5)(iii) when oz is used as the primary serving size.

In the 1991 serving size proposal, FDA did not specifically address how to express voluntary parenthetical labeling of the oz measure that is equivalent to the primary household measure. The oz measure in this case can be any decimal quantity (e.g., 1.4 oz, 2.2 oz, 5.1 oz). These oz measures are not the primary serving size required. They represent the equivalent oz quantity that corresponds to the metric quantity declared. For example, the primary measure would be the household measure followed in parentheses by the g equivalent weight. At the manufacturer's discretion, the equivalent oz quantity could also be included. The primary measure is presented in household units or common fractions of household units (1/4 cup) that are familiar and meaningful to consumers. For secondary measures, it is important that the equivalent oz quantity be an accurate reflection of the primary household measure, and it is less important to round to even divisions since the primary measure is "consumer friendly." Therefore, FDA concludes that it is desirable to have a more accurate oz quantity and has modified § 101.9(b)(7) to provide that the oz quantity equivalent to the metric quantity should be expressed in 0.1 oz increments.

For the same reason, it is important that the g-weight equivalent be an accurate reflection of the primary household measure. In the 1991 serving size proposal, the agency did not provide specific guidelines for expressing the parenthetical g-weight equivalent of the household measure. Because the product categories in new § 101.12(b) have been expanded to include spices and herbs that have very small serving sizes (usually less than 1 g), the agency has concluded that it is particularly important to provide guidelines for expressing the g-weight equivalent of the household measure, so that the parenthetical g-weight equivalent would accurately reflect the primary household measure. The agency is providing the following guidelines for expressing the parenthetical g-weight equivalent: For a parenthetical g-weight of 5 g or more, the values should be expressed in the nearest whole number of g. For a parenthetical g-weight of 2 g or more but less than 5 g, the values should be expressed in 0.5-g increments. This incremental rule is consistent with the incremental rule in § 101.9(b)(8) for the number of servings per container for products that contain 2 or more servings but less than 5 servings per container. For a parenthetical g-weight of less than 2 g, the values should be expressed in 0.1-g increments. Accordingly, FDA ha revised § 101.9(b)(7) to read:

> A label statement regarding a serving shall be the serving size expressed in common household measure * * * followed by the equivalent metric quantity in parenthesis * * * The g quantity equivalent to the household measure should be rounded to the nearest whole number except for quantities that are less than 5 g. The g quantity between 2 and 5 g should be rounded to the nearest 0.5 g and the g quantity less than 2 g should be expressed in 0.1 g increments. In addition, serving size may be declared in oz and fl oz * * *.

171. A consumer organization recommended that FDA require manufacturers to round up the label serving size when the reference amount is 0.5 oz. For example, 0.5 oz should be rounded up to 1 oz, 1.5 oz up to 2 oz, and so forth.

FDA disagrees with the comment. Such rounding would introduce large errors in the label serving size, and the label serving sizes would not reflect the amount customarily consumed. For example, rounding 0.5 oz to 1 oz would introduce 100 percent error and rounding 1.5 oz to 2 oz would introduce 33 percent error. Accordingly, FDA has not adopted this recommendation.

172. A manufacturer recommended that the serving size for a single-serving container should be the net weight of the container, and that it should not be rounded to the nearest 0.5 oz. The comment pointed out that if this were not the case, the serving size of a single-serving container having a net weight of 7.2 oz will state 7 oz. The comment said that such a discrepancy would be confusing.

FDA points out that new § 101.9(b)(5) allows manufacturers to use oz as the serving size only if cups, tbsp., tsp., or units such as piece, slice, tray, jar, and fraction cannot be used. The household unit most appropriate for a single-serving container is the description of the container itself (e.g., tray, package, carton, or box), not oz. Therefore, the serving sizes of single-serving containers must be stated in tray, package, carton, or a similar unit appropriate for the specific container. Accordingly, the rounding rule in new § 101.9(b)(5)(iii) does not apply to the single-serving containers.

173. Some consumers requested that FDA standardize abbreviations used on the label.

FDA advises that new § 101.9(b)(7) standardizes abbreviations for units (e.g., g, mL) if a manufacturer elects to use abbreviations.

4. Labeling of "meal-type" products

FDA proposed in § 101.9(b)(3) that the serving size for "meal-type" products, as defined in § 101.13(l) of the nutrient content claims proposal, be the entire content of the package.

174. Several comments requested that the entire content of "meal-type" products that come in multiserving containers (e.g., lasagna, pizza) not be required to be labeled as one serving.

FDA agrees with the comment. Accordingly, the agency is revising § 101.9(b)(3) to exclude multiserving containers. The agency also notes that it has revised § 101.13(l) of the nutrient content claims regulation, published elsewhere in this issue of the Federal Register, by dividing these products into two categories, meal products and main dish products, and adopting new definitions for these products. For clarification, FDA advises that the serving size for a multiserving product that has a reference amount in new § 101.12(b) must be determined according to provisions in § 101.9(b), even if these products are classified as a "meal product" or a "main dish product" in new § 101.13(l) and (m). FDA also notes that for products that do not meet the definition of "meal product" or a "main dish product," claims will be evaluated according to the reference amount in new § 101.12(b) applicable to the product.

To reflect the reclassification and new definitions of "meal product" and "main dish product" in new § 101.13(l) and (m), and for clarity, FDA has revised § 101.9(b)(3) to read: "Serving size for meal products and main dish products as defined in § 101.13(l) and (m) of this chapter that come in single-serving containers as defined in paragraph (b)(6) of this section shall be the entire content (edible portion only) of the package. Serving size for meal products and main dish products in multiserving containers shall be based on the reference amount applicable to the product in § 101.12(b) if the product is listed in § 101.12(b). Serving size for meal products and main dish products in multiserving containers that are not listed in § 101.12(b) shall be based on the reference amount according to § 101.12(f)."

175. One comment requested that FDA require dual declaration, per serving and per 100 g, on "meal-type" products to facilitate nutrition comparisons of these products on an equal basis and to ensure "a level playing field."

FDA disagrees with the comment. The agency recognizes, that because many of these products are used interchangeably in the diet, consumers may want to compare nutritional values of these products. "Meal-type" products (reclassified and redefined as "meal product" and "main dish product" in new § 101.13(l) and (m)) encompass a wide variety of products which vary in product characteristics. Therefore, these products differ greatly in amounts customarily consumed. The agency believes that nutrition information per serving derived from the reference amount applicable to each type of these products facilitates nutrition comparisons of these products on an equal basis in terms of the amount used in the diet. In addition, the 1990 amendments do not provide the authority to require nutrition information per 100 g or 100 mL basis. Accordingly, FDA has not adopted the recommended modification. (However, the agency notes that under new § 101.13(l) and (m), the eligibility of such products to bear nutrient claims will be determined on a per 100 g basis.)

176. Several industry comments suggested that frozen entrees packaged in separate pouches that contain more than one distinct food per package (e.g., rice or pasta with sauce or toppings) should be classified as "meal-type" products rather than mixed dishes.

For the purpose of determining the label serving size, the agency considers these "pouch-type" frozen entrees to be "mixed dishes" rather than "meal-type" products. The components of these frozen entrees are packaged separately for technical reasons, such as differences in required cooking times for the different components and better preservation of the texture and flavor during storage. However, the components from all pouches in a package are consumed as one product like other products in the mixed dishes categories. The only difference between the "pouch-type" products and other mixed dishes is that different components of the "pouch-type" products are packaged in separate pouches within the container, while all components of the other type of mixed dishes are packaged in one container. There is no difference in the characteristics, usage, or the manner of consumption between these two types of products.

However, if a "pouch-type" product meets the definition of "meal product" or "main dish product" in new § 101.13(l) and (m) of the final regulation on nutrient content claims, it will be classified as such for the evaluation of whether the product qualifies to bear a nutrient content claim. If a "pouch-type" product does not meet the definition of "meal product" or "main dish product," its qualification for claims will be based on the reference amount of the specific product.

5. Labeling of variety packs

FDA proposed to require in § 101.9(b)(4) that a variety pack, such as a package containing several varieties of single-serving packages or a product having two or more compartments with each compartment containing a different food, provide nutrition information for each variety or food per serving size that is derived from the reference amount applicable to each variety or food.

177. One comment requested that FDA revise the proposed rule on the labeling of variety packs to state that nutrition labeling should be based on the individual serving actually in each inner container rather than serving size derived from the reference amount.

FDA advises that as long as each inner package meets the requirements for the single-serving unit as defined in § 101.9(b)(2)(i), the content of each inner package is one serving. Thus, the nutrition information would be based on the content in each inner package. Many variety packs contain different products that differ in reference amounts. Therefore, to determine whether each inner package qualifies for the single-serving unit, manufacturers must use the reference amount applicable to each product. Accordingly, FDA has not adopted the comment's request. However, for clarity, FDA has revised § 101.9(b)(4) to read: "A variety pack such as a package containing several varieties of single-serving units as defined in paragraph (b)(2)(i) of this section * * * shall provide nutrition information for each variety or food per serving size that is derived from the reference amount in § 101.12(b) applicable for each variety or food and the procedures to convert the reference amount to serving size in paragraph (b)(2) of this section."

6. Labeling of foods for special dietary use

In the preamble to the 1991 serving size proposal (56 FR 60394 at 60408), FDA tentatively concluded that the serving size requirements that applied to foods intended for weight control or weight reduction, available in the marketplace, should also apply to the products sold only to enrollees of a weight control program. The agency also stated that it would not object if products available only as part of a weight-control program provided dual columns of nutrition information based on the reference amount and the serving size prescribed by the program.

178. A consumer organization supported the proposal but recommended that FDA require both the nutrition information and the product's qualification for claims to be based on the reference amount. Industry comments objected to the proposed requirement. A manufacturer of weight-control products requested that FDA allow manufacturers of portion controlled or other products that are part of a weight-control or weight-maintenance plan to base serving sizes on amounts specified under such plans and not necessarily on serving sizes derived from reference amounts in new § 101.12(b). Comments from the providers of weight-control programs requested that FDA allow them to determine serving sizes that are consistent with the meal plans for products that are available only through the weight-control program. The comments asserted that if portion controlled products are required to use the same serving size as for the regular counterpart, it could lead to overconsumption of these foods and defeat the purpose of the program. The comments claimed that the dual labeling proposed by FDA could be confusing. A nutrition professional organization also stated that dual columns of nutrition information on these products may be confusing.

FDA has given careful consideration to all arguments presented in the comments on this issue. To ensure that the labeling is not misleading, the serving sizes for all foods available in the marketplace to the general public, including those intended for weight-control or weight-reductions, must be based on the reference amount in new § 101.12(b). However, the agency also finds that for weight-control products that are available only as part of a weight-control program, the use of a serving size that differs from the serving size for the meal plan may be confusing to the enrollees and may undermine the purpose of the program. Therefore, the agency concludes that, for products that are available only through the weight-control program and are not available at a general retail store, it is in the best interest of the enrollees of the weight-control program to have labeling that is consistent with the meal plan of the program in order to avoid any potential confusion about the serving size. FDA has revised § 101.9(b)(2) to exempt products that are both intended for weight-control and available only through weight-control or weight-maintenance programs. To avoid any confusion with the general retail products, manufacturers are required to label their products as "for sale only through the ———— program" (fill in the blank with the name of the appropriate weight-control program, e.g., Smith's Weight Control), on the principal display panel. If these products are also available at the retail market, the serving size derived from the reference amount must be used. FDA advises that qualification of these products for nutrient content or health claims will be based on the reference amount, not the serving size determined by the provider of the weight-control program.

In addition, FDA advises that the label statements regarding the usefulness of these products in reducing or maintaining body weight are subject to the provisions in new § 105.66 of the nutrient content claims regulation published elsewhere is this issue of the Federal Register.

G. Declaration of Number of Servings Per Container

FDA proposed in § 101.9(b)(8) that a manufacturer, in declaring the number of servings per container, may use either of the two options listed in that section, choosing the one most meaningful for a specific product. The options proposed were: (1) Declare serving size as the approximate whole household measure that results in a whole number of servings in the container (e.g., serving size: approximately 1/2 cup; number of servings per container: 10) or (2) declare the serving size in the exact household measure and the approximate number of servings per container (e.g., serving size: 1/2 cup; number of servings per container: approximately 10). In either case, FDA proposed to require that whole numbers of servings be used with the exception of random weight products. For random weight products, FDA proposed to use "varied" for the number of servings per container provided the nutrition information is based on the reference amount expressed in oz.

179. Most comments supported the proposed requirements for the declaration of the number of servings per container. However, several comments objected to rounding the number of servings to the nearest whole number. The comments argued that rounding to the nearest whole number does not accurately account for the actual number of servings in a container and in many cases would significantly distort a container's contents, especially for packages containing between 1.5 to 4.5 servings. Some of the comments acknowledged that many consumers do not like fractional numbers of servings on the label but argued that this dislike results primarily from the use of odd decimal fractions (e.g., 2.7 servings) and from fractional numbers of servings on packages typically consumed in their entirety (e.g., 1.5 servings on a 12 fl oz can of soda). The comments stated that rounding to the nearest 0.5 servings would be understood by virtually all consumers. A few comments suggested that at the very best, FDA should permit rounding to the nearest half-serving for packages containing 4.5 servings or fewer.

FDA acknowledges that consumer objections to the fractional number of servings may be the result of the use of odd fractional numbers of servings and of their use on products typically consumed in their entirety. The agency agrees that, for packages containing 4.5 servings or less, the number of servings in 0.5-increments would reflect more closely the number of servings in the container. For larger containers, the 0.5 serving difference between the next lower or next higher whole number is a smaller relative percentage of the total number of servings in the package and, therefore, reflects an unrealistic and meaningless precision (e.g., 8.5 servings or 28.5 servings) because the number of servings are approximations. For this reason, FDA has revised § 101.9(b)(8) to allow fractional servings on packages containing between 2 and 5 servings. This procedure would reduce the errors in the number of servings per container to a maximum of about 12 percent (2.24 servings rounded to 2 servings) or less.

179a. Several comments addressed the two options proposed in § 101.9(b)(8) for declaring the number of servings per container. A comment from a trade association stated that the two options would provide manufacturers flexibility in deciding the number of servings per container appropriate to their food products and providing the consumer with the most useful serving size information. Other comments from industry, consumers, and consumer organizations expressed concern about providing an option. They stated that allowing the two options would result in different serving sizes (and thus different nutrition information) for different brands of the same food, making nutrition comparisons of different brands difficult. One consumer organization contended that it is more important for consumers, especially those on medically-prescribed diets, to know the exact serving size that is the basis for the nutrition information than the exact number of servings. These latter comments recommended that FDA require manufacturers to list the exact serving size and an approximate number of servings per container.

Although the two options would provide flexibility to manufacturers, FDA recognizes that it would result in nonuniformity in serving sizes of different brands of the same food. The agency also agrees with the latter comments that it is more important to have the exact serving size than the exact number of servings. Many comments on the 1991 serving size proposal stated that the serving size regulation should facilitate nutrition comparisons of different brands. Therefore, FDA has revised § 101.9(b)(8) to require the exact serving size and the approximate number of servings.

180. Most comments approved of permitting the "varied" declaration for the number of servings on random weight products. However, one comment from a consumer organization expressed concern. The comment argued that the "varied" declaration is unnecessary because random weight products, such as cheese, are usually priced per pound, and the retailer or manufacturer must weigh a package of cheese to determine the price. The comment contended that once the weight has been measured, the servings per container can be easily calculated.

FDA agrees that random weight products are usually priced by weight, and that the retailer or manufacturer must weigh the product first to price it. However, because these products vary widely in weight, it would be difficult for retailers and manufacturers to have labels printed with the number of servings per container unless they have automated label machines that print the number of servings as they print the weight. Therefore, it would be unreasonable to require all retailers and manufacturers to include the number of servings on random weight products. Accordingly, FDA is retaining the "varied" declaration for the number of servings on random weight products. However, the agency encourages the retailers and manufacturers to label the number of servings per container if they have automated machines or some means to provide the information.

181. A few comments suggested that FDA permit an optional declaration of "typical number of servings" with the term "varied" on random weight packages. The comments contended that an approximate number of servings per container could help consumers determine the approximate number of servings contained in the package.

FDA agrees with the comment. Accordingly, FDA has revised § 101.9(b)(8) to allow voluntary labeling of the "typical number of servings" when "varied" is used to declare the number of servings per container, e.g., "varied (usually 5 servings)" or "varied (usually 4 to 6 servings)." The agency encourages manufacturers to provide the typical number of servings whenever feasible.

182. Several comments from the pickle industry stated that the size and shape of the vegetables used to make pickles vary widely as a result of numerous factors, including the variety, weather conditions, and maturation when harvested. The comment contended that pickles are random weight products and should be allowed to use "varied" for the number of servings per container.

FDA disagrees with the comments. Products that contain individual units in the container that vary in size, such as pickles, are not random weight products because the net quantity of the container size remains constant. Random weight products are those products that are sold in units whose net quantity of contents is random, e.g., cheese. In the case of random weight cheese, the number of servings is difficult to estimate because the net quantity of content vary widely from package to package of the same product. Because the container size of pickles (and thus the net quantity of contents) is constant, pickle manufacturers, unlike cheese manufacturers, can have a label printed for each size of the container. Therefore, FDA is not allowing a "varied" declaration on pickles.

However, because the serving size for pickles will be based on the drained solids, the net quantity of the drained solids in the same size container may vary somewhat because of the variation in the size and shape of pickles. Consequently, the number of servings per container may vary somewhat for different containers of the same size. Therefore, FDA has revised § 101.9(b)(8) to allow declaration of the typical number of servings per container (e.g., usually 5 servings) for canned products that naturally vary in unit size, and the serving size is required to be expressed on the drained solids basis (e.g., pickles).

183. A few comments from the produce industry requested that FDA clarify in the serving size regulation that raw fruits and vegetables are exempt from declaring the number of servings per container.

FDA advises that raw fruit, vegetables, and fish are exempt from mandatory nutrition labeling requirements under new § 101.9(j)(10) (see document entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" published elsewhere in this issue of the **Federal Register**). These foods are subject to the guidelines of the voluntary nutrition labeling program in § 101.45. Section 101.45(b)(3) states that the number of servings per container need not be included in nutrition labeling of raw fruit, vegetables, and fish. Accordingly, there is no need to cover this exemption in new § 101.9(b).

184. A manufacturer requested that FDA confirm in a preamble statement to the final rule that the product of the number of servings multiplied by the parenthetical metric equivalent of the serving size is not expected to precisely equal the net quantity of the product declared on the principal display panel.

FDA concurs with the comment's statement. It is true for two reasons: (1) An oz is defined differently for the net quantity of content regulation than for the serving size regulation, and (2) the number of servings are usually an approximate number. One oz is defined as 28.3452 g for the determination of the net quantity of contents (Ref. 39) and 28 g for the purpose of labeling serving size.

H. Other Related Issues

1. "As packaged" versus "as consumed" as the basis for the nutrition information

In § 101.9(b)(9) of the 1991 serving size proposal, FDA proposed that the declaration of nutrient content information shall be on the basis of food as packaged or purchased with the exception of those products that were specifically excluded. Additionally, FDA encouraged manufacturers to voluntarily provide the nutrient content of their products on an as consumed basis using package directions for preparation (56 FR 60394 at 60413).

185. Several comments supported the proposed rule. A health professional organization strongly opposed nutrition labeling on an as prepared (i.e., as consumed) basis because nutrition information should reflect the content of food in the package that consumers are selecting and purchasing. A consumer comment stated that all nutrition information should be based on food as packaged. Anything beyond that becomes the consumer's responsibility.

Many other comments objected to the proposal for basing the nutrition information of the products that require further preparation before consumption (e.g., dry mixes) on an as packaged basis. The comments requested that FDA require that nutrition information on these products be provided on an as consumed basis. The comments contended that because these products cannot be eaten in the form packaged and often require adding additional

ingredients, nutrition information on an as packaged basis is not meaningful to consumers. Some comments argued that nutrition information on an as packaged basis does not allow consumers to make informed comparisons between similar products in different forms (prepared and dry) and provides no incentive for manufacturers to develop preparation directions in support of current dietary recommendations. A manufacturer argued that the nutrition information on an as packaged basis for products that require the addition of other ingredients often underestimates the nutritional contribution of the product in the total daily diet because it does not include the nutrient contribution of other ingredients added in the preparation for consumption. The comment contended that in these cases, as packaged information violates the 1990 amendments that require the nutrition information to be conveyed in a manner which enables the public to understand its relative significance in the context of a total daily diet.

Some comments from the popcorn industry objected to nutrition labeling on an as packaged basis because: (1) Popcorn is inedible as packaged, and (2) some of the fat that is added to microwave popcorn to facilitate popping sticks to the bag after popping and is therefore not consumed. Nutrition labeling on an "as packaged" basis would, therefore, overstate the fat content as consumed.

Several comments also asserted that the qualification of a product for nutrient content claims should be based on the product "as prepared." Comments stated that nutrient content claims based on the product as packaged could be misleading on those products that, when prepared according to package directions, would not meet the criteria for the claim on an "as prepared" basis.

Other comments suggested that products that require the addition of ingredients, such as dry cake mixes, should list nutrition information on both an "as packaged" and an "as prepared" basis. The comments contended that if they did not, labels that list the fat and sodium contents as "0" (zero) would lead consumers to believe that these products are fat free or sodium free when eaten, even though fat and salt must be added according to the preparation directions.

FDA does not agree with the comments that suggested that FDA should require nutrition information on an "as prepared" basis. The agency has found that it cannot regulate products as effectively on an "as prepared" basis. For example, many products that require further preparation before consumption require the addition of ingredients. The nutrient content of a particular ingredient may vary from brand to brand (e.g., different brands of butter may vary in sodium content; different brands of fats and oils may vary in saturated fatty acid content). In addition, manufacturers often provide multiple directions for preparation (e.g., using different types of fats, several directions for preparing different foods such as pancakes, waffles, and biscuits). There may be no obvious or rational basis for the agency to determine which set of directions should be used to check the accuracy of the nutrition information. Furthermore, a product may be used by consumers in many different ways, and the agency has no control over how a product is used after purchase.

However, FDA recognizes that it would be helpful to make comparisons of foods in their prepared state (e.g., prepared package salad dressing and bottled salad dressing). Therefore, for the benefit of the consumers who follow the package directions in preparing these products, the agency continues to encourage manufacturers to voluntarily provide nutrient information on their products on an as prepared basis, using the package directions in preparing the food, and, in the case of multiple directions, using the directions that represent the major usage of the product. The agency agrees that such voluntary information may provide an incentive for manufacturers to develop methods of preparation that support dietary recommendations.

The agency disagrees with the comment that "as packaged" nutrition information violates the 1990 amendments because the "as packaged" information underestimates the nutritional contribution of the product to the total daily diet. Section 403(q)(1) of the act states that nutrition information is to be provided on "a food intended for human consumption and is offered *for sale* * * *" (emphasis added). Thus, the manufacturer has the responsibility to provide nutrition information on the product as offered for sale. Once the product is purchased and other ingredients are added, the packaged product becomes a different product. Therefore, the contribution of a product to a total daily diet must be evaluated in terms of the nutrient content of the product in the package as sold.

With regard to the comments about the nutrition labeling of unpopped popcorn, the agency notes that popcorn is no different than other foods that require further preparation before consumption (e.g., cake mixes, pancake mixes) and that are required to provide nutrition information on an as packaged basis. Therefore, no special provision is needed for unpopped popcorn. The agency notes, however, that § 101.9(b)(10)(iii) permits a second column on nutrition information on popcorn products in multiserving containers on a per cup popped basis.

As for the fat in microwave popcorn, the agency notes that the amount of fat that is retained with the popcorn may vary depending on the popping conditions and equipment used. Therefore, the agency cannot monitor compliance on an as consumed basis.

In regard to comments that nutrient content claims should be based on the product "as prepared," FDA notes that it did not address this issue in either the 1991 serving size proposal or the proposal entitled "Nutrient Content Claims, General Principles, Petitions, Definition of Terms" (56 FR 60421, November 27, 1991). The agency does not believe that the 1990 amendments contemplated regulation of claims on products as prepared by the consumer. Section 403(r) of the act focuses on claims for nutrients in the food that is offered for sale. Moreover, regulation on an "as prepared" basis would raise significant compliance problems. However, the agency does agree that a nutrient content claim could be misleading if directions for use of the packaged product specify the addition of ingredients that would result in the finished edible product no longer meeting the criteria for the claim. If FDA finds that a problem exists in the marketplace after implementation of these final rules, the agency will consider further rulemaking under section 403(a) of the act.

Likewise, FDA did not propose to require that a product that requires the addition of ingredients declare nutrition information on both an as purchased and an as prepared basis, and, as discussed previously, the agency does not believe that it is appropriate to do so.

186. Some comments stated that for products where water must be added before the product can be consumed (e.g., dry soup or noodle mixes), the nutrition information should be based on the rehydrated product.

FDA advises that water contains some minerals. In its final rule on the declaration of sodium content in nutrition labeling, the agency reviewed and discussed data on the sodium content of the U.S. water supplies (49 FR 15510 at 15524). The data showed that sodium ranged from less than 3 mg to approximately 52 mg per 6 fl oz.

However, to prevent the introduction of error in the analysis of a product for compliance purposes, the agency is denying this request.

187. A health professional organization recommended that for products where choice in the preparation method can markedly alter its nutritional content, nutrition information on the product as prepared should be provided through educational point of purchase materials or in places on the package other than the nutrition label.

FDA has no objections to the placement of nutrition information other than that required in the nutrition label on other places on the label or in labeling (such as point of purchase materials). However, the agency has no authority to require such information. Accordingly, no action is being taken on this comment.

2. Nutrition information on a drained solids basis

Food consumption data showed that the liquid in foods such as canned fish, canned maraschino cherries, pickled fruits, olives, and canned or pickled vegetables is not customarily consumed. Therefore, FDA proposed in § 101.9(b)(9) to require that the declaration of nutrient and food component content of such foods be based on the drained solids.

188. Comments from a food manufacturer and a trade association opposed the proposal for basing nutrition information on a drained solids basis for beans, potatoes, and vegetables canned in liquid. The comments contended that upon cooking starch and other nutrients are released into the packing medium. The comments argued that because the entire contents of the container is frequently consumed, information on a drained weight basis would be misleading. One comment submitted data from a marketing survey showing that a large percentage of people use the liquid.

FDA agrees with the comment that the marketing survey showed that a large percentage of people use the liquid and that the liquid also contains nutrients (Ref. 64). Accordingly, the agency has deleted canned beans, potatoes, and vegetables from the list of foods in new § 101.9(b)(9) that are exempted from the requirement for nutrition information on an "as packaged" basis and has modified footnote 6 for Table 2 in new § 101.12(b) to reflect this change. Canned beans, potatoes, and vegetables will, therefore, be required to provide nutrition information on an "as packaged" basis.

189. An industry comment stated that the liquid that is present in "Alaska" canned salmon is the natural juice that has cooked out of the fish during thermal processing, and no additional liquid is added to "Alaska" canned salmon. The comment, therefore, asserted that nutrition information for canned salmon should be on an "as packaged" basis.

FDA agrees with the comment that nutrition information on canned salmon to which liquid has not been added for canning should be based on an as packaged basis. Accordingly, the agency has revised the footnote to Table 2 in new § 101.12(b) so that canned salmon that is not in a liquid packing medium is required to be labeled on an "as packaged" basis. Canned salmon that is in a liquid packing medium is subject to being labeled on a drained weight basis. The revised footnote reads: "If packed or canned in liquid * * *."

3. Miscellaneous issues

190. A manufacturer requested that FDA install a toll-free telephone number regarding questions on the reference amounts.

FDA advises that budgetary constraints do not allow for the installation of a toll-free telephone number to assist manufacturers in any aspect of the implementation of these final rules. However, agency personnel will respond to the maximum extent possible to all written or telephone requests for assistance. In addition, the agency intends to prepare materials to assist manufacturers in implementing these regulations as well as the educational materials to assist consumers in understanding and using the new nutrition labels.

I. Listing of a Second Column of Values

1. Listing nutrient contents based on 100 g, 100 mL, 1 oz, or 1 fl oz

FDA proposed in § 101.9(b)(10) that another column of figures may be used to declare the nutrient and food component information on the basis of 100 g or 100 mL or of 1 oz or 1 fl oz of the food as packaged or purchased.

191. Most comments on this issue supported voluntary labeling of a second column of values on a uniform basis. These comments reasoned that the second column of values provides nutrition information on a uniform basis, which aids consumers in making nutrition comparisons of different products. Some comments that supported voluntary labeling of a second column of values stated that FDA should not provide two choices for the basis of the second column. Comments that addressed the choice for the basis of the second column preferred 100 g or 100 mL over 1 oz or 1 fl oz. These comments stated that nutrition information per 100 g (or mL): (1) May be useful for persons on a special diet for medical reasons, (2) may assist consumers in understanding the metric system, or (3) is the only presentation of nutrition information internationally understood. One international comment stated that nutrition information per 100 g should be mandatory, and the information per serving should be voluntary. Another international comment stated that nutrition information per 100 g or 100 mL should be allowed on European products. A domestic comment stated that the second column of values per 100 g or 100 mL should be mandatory.

Comments objecting to the use of a second column stated that: (1) The second column of values would be confusing to consumers or is too much information, thus contributing to label clutter, (2) consumers may not understand why this information is on the label or understand how this quantity differs from a typical serving size, (3) consumers may have little need to compare 100 g of mustard with 100 g of a 12 oz frozen dinner, or (4) it is not necessary to add a second column on a per 100 g or 100 mL basis for the reason of international harmonization because every country has its own unique label requirements. Comments argued that because of these vastly different requirements, it is virtually impossible to use U.S. labels internationally.

FDA has given careful consideration to all arguments for and against the second column of values presented in the comments. To facilitate comparison of the nutritional composition of different products, the agency agrees that it would be desirable to have a uniform basis for the second column. However, for consistency with USDA's regulation, the agency has decided to retain the two choices for the basis of the second column as proposed.

FDA disagrees with the comment that stated that the second column of values per 100 g or 100 mL should be mandatory. The 1990 amendments do not mandate such a requirement. Further, nutrition information per 100 g or 100 mL is not meaningful for many foods that are customarily consumed in small quantities (e.g., croutons, crackers, cream and cream substitutes, sugar, butter, margarine, oil, and condiments) and dry mixes (e.g., dry beverage mixes). Therefore, the agency has not adopted this recommendation.

FDA is not persuaded that the declaration of nutrition information in a second column on a per 100 g or 100 mL basis should be prohibited. The provision is voluntary; therefore, manufacturers who do not wish to present the second column of values are not required to provide it. However, the presence of the information could help to facilitate comparisons between types of foods. While one comment stated that there is little need to compare 100 g of foods which would not be used interchangeably (e.g., mustard and frozen dinner), FDA notes that facilitation of nutrition comparisons is intended for different products which are used interchangeably in the diet.

Considering the weight of the comments supporting the second column of values on a uniform basis, FDA believes that voluntary labeling of a second column of values is desirable. This information will enable those who desire the information to benefit from it. Additionally, in response to comments that said a second column would be confusing, FDA intends to follow publication of these final rules with consumer education activities about the new food labeling requirements. This education initiative will assist consumers in understanding the utility of a second column of values based on 100 g, 100 mL, 1 oz, or 1 fl oz and should minimize consumer confusion.

Therefore, FDA has retained § 101.9(b)(10) as proposed and redesignated as § 101.9(b)(10)(i).

2. Mandatory listing of nutrient contents for a use that differs in quantity by twofold or greater from the use upon which the reference amount was based

FDA proposed in § 101.9(b)(11) that if a product is promoted on the label, labeling, or advertising for a use that differs in quantity by twofold or greater from the use upon which the reference amount was based (e.g., liquid cream substitutes promoted for use with breakfast cereals), the manufacturer must provide a second column of nutrition information based on the amount customarily consumed for the promoted use in addition to the nutrition information per serving derived from the reference amount in § 101.12(b).

192. Two comments from consumer and nutrition professional organizations supported the proposal. One of the comments recommended that FDA also require dual columns of values on foods "that are consumed in two quantities that differ by two-fold or greater, as long as the alternative use occurs at least 25 percent of the time." To illustrate the point, the comment cited the use of liquid cream substitutes in coffee versus on cereal or fruit. On the other hand, a comment from a trade association argued that this approach is not required under the act and could severely hamper traditional marketing techniques and reduce the flow of helpful information to consumers. They further stated that such a requirement is simply unworkable, particularly for nondiscrete bulk products packaged in multiserving containers (e.g., flour, sugar, multipurpose baking mixes). Many manufacturers make recipes available to the consumer through labeling (e.g., recipe booklets) and advertising. Many of these recipes are for the use of modified substitutes in regular recipes, such as lower fat alternatives. Manufacturers may also promote multiple uses of their products, some of which may suggest the use of the quantity of the product by twofold or greater than the reference amount. In such circumstances, the manufacturer could not possibly label the amount customarily consumed for every promoted use. Under such a rule, manufacturers will be less likely to promote several types of legitimate uses for their products. The comment stated that FDA should not discourage the dissemination of information that consumers find useful and informative.

FDA disagrees that in addition to requiring dual columns for promoted uses, FDA should also require dual columns for alternative uses that occur at least 25 percent of the time. Many foods are used for more than one purpose, and it is not always possible for manufacturers to determine which uses constitute 25 percent or more of the total usage of the food and to continually monitor trends in usage with this kind of precision. Consequently, FDA is not requiring dual columns based on percentage of use of the food.

However, FDA does find that this situation must be addressed. Section 403(q) of the act defines a serving size to be an amount customarily consumed. In some cases, such as the example given in proposed § 101.9(b)(11) of cream substitutes, the reference amount for the product category in § 101.12(b) clearly does not represent the customarily consumed amount for the product's promoted use on breakfast cereal. Thus, a separate customarily consumed amount is needed for the promoted use according to the definition of the serving size under the act. In addition, the agency notes that under 403(a) of the act, the nutrition information based on the reference amount (1 tbsp.) for the liquid cream substitute example is misleading for its promoted use with breakfast cereals (1/2 cup). Therefore, FDA believes that it has legal authority under section 403(a) and (q) of the act to require dual columns of values based on the customarily consumed amount for each use.

Finally, FDA agrees with the comment that stated that it is unreasonable to require multiple columns of values for some nondiscrete bulk products that are used primarily as ingredients (e.g., flour, sweeteners, shortenings, oils), traditionally used for multipurposes (e.g., eggs, butter, margarine), and multipurpose baking mixes (e.g., mixes with multiple recipes) because the products are promoted generically and are listed in hundreds of recipes and requiring hundreds of columns would be impractical and impossible.

Accordingly, in regard to dual columns, in new § 101.9(b)(11), FDA has retained the requirement for dual labeling for products that are promoted for a use that differs by twofold or greater from the use upon which the reference amount is based. However, the agency has added a statement that specifically exempts certain foods from this requirement for dual labeling: nondiscrete bulk products used primarily as ingredients (e.g., flour, sweeteners, shortenings, oils) or traditionally used for multipurposes (e.g., eggs, butter, margarine), and multipurpose baking mixes.

193. A trade association objected to the use of advertising to determine whether a second column of nutrition information is required under § 101.9(b)(11).

The agency advises that it views advertising as evidence of how the manufacturer intends the product to be used. If, as discussed in the preceding comment, this use is significantly different than the use on which the reference amount is based, the provisions of new § 101.9(b)(11) are triggered. Accordingly, FDA is not making the suggested change.

J. Use of Serving Size to Evaluate Nutrient Content and Health Claims

FDA proposed in § 101.12(g) to require that the reference amount be used in determining whether a product meets the criteria for nutrient content claims, such as "low calorie," and for health claims. However, the agency noted that label serving sizes often differ from the reference amounts. Thus, products that meet the criteria for a claim on a reference amount basis may not qualify on a serving size basis. For example, a soft drink that contains 30 mg of sodium per reference amount (240

mL) meets the criteria for a "very low sodium" claim (less than or equal to 35 mg per 8 fl oz (240 mL)). A 12-fl oz single-serving container of this soft drink, however, contains 50 mg of sodium and, therefore, would not qualify for the "very low sodium" claim. For these products, FDA proposed that both the reference amount and the label serving size be used to determine whether the product meets FDA criteria for a claim. The agency also discussed another option based solely on the reference amount plus a disclaimer and solicited comments on both options.

194. Many comments supported the proposal to base claims on both the reference amount and the label serving size. However, numerous comments from the food industry, nutrition professionals, Government, and consumers contended that claim evaluations for all products should be based solely on the reference amount. The comments argued that claims should reflect the true characteristics of the product, and that a product that qualifies for a claim should be able to bear the claim on all container sizes. According to these comments, using both the reference amount and the label serving size as criteria will result in a product that would be able to bear a claim for one container size but would not be able to bear the same claim for another. The comment stated that such inconsistency in the use of claims for the same product in different-sized containers would be confusing to consumers and should not be permitted. Some of these comments suggested that FDA's concern about the misleading claims could be alleviated by requiring a statement of the basis for the claim along with the claim on a product that meets the criteria only on the basis of the reference amount, e.g., "very low sodium, 35 mg or less per 8 fl oz."

As discussed in the 1991 serving size proposal (56 FR 60394 at 60412), there are advantages and disadvantages to both options. After careful consideration of the comments received and of the advantages and disadvantages of both options, FDA concludes that the most reasonable solution for this issue is to base claim evaluations on the reference amount and to require a disclaimer with the claim. FDA agrees with the comments that claims should reflect the true characteristics of a product, and those characteristics do not change if the product is packaged in a different size container. Thus, it is appropriate to use the standard established by FDA, the reference amount, as the basis for evaluating claims. However, FDA also recognizes that products packaged in containers that differ from the reference amount may contain an amount of the nutrient significantly different from the amount on which the claim is based (e.g., 50 mg of sodium in a 12-fl oz container that can claim "very low sodium" since it contains only 35 mg sodium per 8 fl oz). In order to not be misleading, FDA agrees with the comments suggesting that a disclaimer that includes a statement of the basis for the claim is appropriate on such products. The agency recognizes that consumers may not readily understand the significance of the disclaimer (i.e., that it is alerting them to the fact that the product does not meet the criteria for the claim on the basis of the label serving size). The agency intends to inform consumers about the meaning of various claims on product labels through nutrition education activities that will follow the publication of the final regulations for food labeling. Accordingly, FDA has revised § 101.12(g) to base the qualification for a claim on the reference amount and to require a disclaimer if the label serving size of a product differs from the reference amount, and the product does not qualify for the claim on the basis of the label serving size.

In presenting the disclaimer, manufacturers must state the reference amount as it appears in new § 101.12(b). The reference amount in metric measure should be followed, in parenthesis, by the equivalent household measure appropriate for the food. Many consumers have complained that they do not understand metric measures. The parenthetical household measure should help consumers to visualize the quantity on which the claim is based. For example, a 12-fl oz soft drink that meets the criteria for "very low sodium" per reference amount, but not per 12 fl oz, would state "very low sodium, 35 mg or less per 240 mL (8 fl oz)." A slice of bread that meets the criteria for "high in fiber" per reference amount, but not per slice, would state "high in fiber, 20 percent or more of the Recommended Daily Intake per 50 g (about 1 1/2 slices)."

Revised § 101.12(g) reads:

The reference amount set forth in paragraphs (b) through (f) of this section shall be used in determining whether a product meets the criteria for nutrient content claims, such as "low calorie," and for health claims. If the serving size declared on the product label differs from the reference amount, and the product meets the criteria for the claim only on the basis of the reference amount, the claim shall be followed by a statement that sets forth the basis on which the claim is made. That statement shall include the reference amount as it appears in § 101.12(b) followed, in parenthesis, by the amount in common household measure if the reference amount is expressed in measures other than common household measures (e.g., for a beverage, "Very low sodium, 35 mg or less per 240 mL (8 fl oz).

195. A few comments recommended that the determination as to whether a food qualifies to bear a nutrient content or health claim should be based only on the label serving size.

FDA disagrees with the comment. Basing claim evaluations only on the label serving size could encourage manipulation of serving sizes to qualify for claims. Therefore, FDA is not adopting this recommendation.

196. Other comments recommended using 1 oz as the basis for the claim evaluation. The comments contended that 1 oz is a simple criterion and provides a "level playing field" for all products making claims.

FDA believes that 1 oz is inappropriate to use for declaring nutrient content or for evaluating claims because it has no relation to the amount of food customarily consumed or a food's contribution to the total daily diet as required by the 1990 amendments and thus will result in misleading or meaningless claims. For example, on a 1 oz basis, foods that may qualify for a "high" claim on a per serving basis (e.g., "high calcium" on yogurt) may not be able to bear the claim, whereas foods that may not qualify for a "low" claim on a per serving basis (e.g., "low calorie" cake) may be able to bear the claim. Therefore, FDA is not adopting this recommendation.

K. Petition Process

FDA proposed in § 101.12(h) a set of requirements for filing a petition to establish or amend a reference amount.

Several comments from nutrition professional organizations and the industry supported the petition process. A major trade association stated that the system is necessary because of the changing consumption patterns of Americans and the everchanging nature of food products. The association further stated that it agrees with the type and amount of information proposed by FDA to be included in the petition. A few comments opposed or expressed a reservation on certain specific aspects of the petition process as described below.

197. FDA proposed in § 101.12(h)(11)(i) to provide that a petition to create a new subcategory of food with its own reference amount must include data that demonstrate that the new subcategory of food will be consumed in amounts that differ enough from the reference amount for the parent category to warrant a separate reference amount. Data must include sample size

and the mean, median, and modal amounts consumed per eating occasion for the petitioned product and for the products in the parent category, excluding the petitioned product.

An industry comment objected to the requirement in proposed § 101.12(h)(11)(i) for data on other products in the category. The comment stated that this information is not necessary, and that the data requirement is so burdensome that a petition for a new subcategory is almost impossible.

FDA disagrees with the comment that the data requirement for other products in the parent category is not necessary. The consumption data for other products in the category are needed to compare with the consumption data for the petitioned product to ensure that the customarily consumed amounts of the two product groups differ enough to warrant a separate reference amount for the petitioned product. The consumption data for other products in the parent category serve as the reference standard against which the consumption data for the petitioned product can be compared. Without a reference standard, it can not be known whether the difference in the customarily consumed amount of the petitioned product and the reference amount for the parent category is real or the result of the methodological or procedural differences in the surveys used. Use of the data on the other products is analogous to using a control or a reference standard in a laboratory experiment to validate the value of a test article.

FDA also disagrees that the data requirement is so burdensome that a petition for a new subcategory is almost impossible. Available national food consumption data bases provide information needed to meet the data requirement in new § 101.12(h)(11)(i). Some comments on the 1991 serving size proposal presented evidence that a relatively inexpensive survey can be conducted to collect food consumption data under actual conditions of use when information is not available from data bases.

However, to avoid an overly stringent data requirement, paragraph (h)(11)(i) has been modified to reduce the amount of information that must be submitted. While the proposed provision required information "* * * for the petitioned product and for all products in the category, excluding the petitioned product * * *," the modified provision seeks only data "* * * for the petitioned product and for other products in the category, excluding the petitioned product * * *." Also, to correct an oversight, the agency has added standard deviation to the data requirement to read "* * * Data must include sample size; and the mean, standard deviation, median, and modal consumed amount * * *."

198. FDA proposed in § 101.12(h)(14) that as part of the petition submission, a statement must be included concerning the feasibility of convening associations, corporations, consumers, and other interested parties to engage in negotiated rulemaking to develop a proposed rule consistent with the Negotiated Rulemaking Act of 1990 (Pub. L. 101–648). A consumer organization opposed the negotiated rulemaking in establishing a reference amount through a petition. The comment contended that the process is resource-intensive and will favor those organizations and companies that have the time and money to devote to such negotiations.

FDA believes that in certain circumstances, negotiated rulemaking may be a useful tool in developing new or amended reference amounts. The feasibility of convening an appropriate group of interested parties would be discussed by the petitioner; however, the decision on whether to convene a discussion session would be at FDA's discretion with full awareness of agency resources. FDA is convinced that it is frequently useful to provide a forum for open discussion of particularly contentious issues. All interested parties, including consumer organizations, would be invited to participate in any such negotiated rulemaking. Therefore, FDA has retained § 101.12(h)(14) as proposed.

199. One industry comment requested that a procedural method be established to modify, add, or expand a category or reference amount. Because of the length of time necessary for issuing and finalizing a proposal as a result of a petition, the comment stated that the proposed petition method is not optimal. The comment recommended that USDA and FDA investigate alternatives to the proposed petition process.

FDA believes that the petition process referred to in § 101.12(h) is the appropriate process to establish or amend a reference amount. Such a process is necessary because the reference amounts adopted by the agency have the force and effect of laws. However, new § 101.12(h) merely incorporates the citizen petition process in § 10.30. This petition process will ensure full participation of all interested parties. FDA recognizes that issuing and finalizing a proposal does take time. Therefore, the agency will do its best to expedite the petition for establishing or amending a reference amount so that the petitioner can properly label and market its product at the earliest date possible.

200. A trade association contended that manufacturers of the products with reference amounts in § 101.12(b) are at a competitive advantage over those manufacturers whose products are not included in § 101.12(b) because they do not have the burden or expense of petitioning for a reference amount. The comment argued that the petition process is unfair, and that it is the government's responsibility to provide a rational basis for determining serving sizes on all products. The comment further contended that in the absence of a meaningful reference amount for a product, a "small" business should be permitted to determine an appropriate reference amount or to delay nutrition labeling until FDA has completed its task.

FDA disagrees with the comment. To comply with the act, the agency has established reference amounts for virtually all foods in the current food supply that are regulated by FDA. The agency notes that the list of reference amounts in new § 101.12(b) is extensive and applicable to all products that belong to the generic description of the product category. Therefore, manufacturers should be able to find reference amounts for practically all products currently in the food supply.

The agency is aware that new products are continuously being introduced into the market. Because the product category description is generic, manufacturers should also be able to find the reference amounts in § 101.12(b) that are applicable to most of these new products. However, some new products may not fit in the product categories in § 101.12(b). Therefore, the agency has installed a petition process to establish or amend reference amounts to encompass new products that do not fit in any of the product categories in § 101.12(b) and any products in the current food supply that were not brought to FDA's attention in this rulemaking process. Although FDA recognizes that there is both time and money involved in the petition process, this process is necessary to keep the reference amounts in § 101.12(b) current.

The agency agrees that it has the authority to establish the reference amount. However, it is not FDA's responsibility to know every new food product that is introduced in the market. The agency points out that it is the manufacturer's responsibility to inform FDA if any products have not been covered by § 101.12(b) and to provide appropriate information to

establish or amend the reference amounts in § 101.12(b).

Lastly, the agency points out that "small" businesses as defined in § 101.9(j)(1) are exempt from nutrition labeling and thus, there is no need for concern about the petition process.

V. Other Affected Rules

The agency proposed to revise 21 CFR 101.8(a) to state that where nutrition information is required, and firms elect to place statements on product labels concerning the number of servings in a package in other locations in addition to the location where nutrition information is placed, such statements must be in the same terms as that used for nutrition information. FDA proposed this revision to prevent consumer confusion over serving size.

FDA received no comments on this provision. However, to correct a typographical error in the 1991 serving size proposal, the agency has modified § 101.8(a) to read: "* * * Such statement shall not be misleading in any particular * * *."

V. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in its nutrition labeling proposed rules published in the **Federal Register** of November 27, 1991 (56 FR 60366 et al.), the agency determined that under 21 CFR 25.24(a)(8) and (a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

In its November 1991 nutrition labeling proposed rules, the agency proposed that the final rules for these actions would become effective 6 months following their publication in the **Federal Register**. Several comments on the nutrition labeling proposed rules suggested that there would be significant adverse environmental effects from the final rules unless the agency allowed more time between the publication of the final rules and their effective dates. The concern in these comments was that, if the agency did not allow firms more time between the publication of the final rules and their effective dates to use up existing label inventories, large stocks of labels and labeled packaging would have to be discarded. These comments questioned whether the agency had sufficiently examined the impact of disposing of obsolete labels and labeled packaging on this country's solid waste disposal capabilities. Two comments estimated the amounts of labeling from their respective industries, i.e., dairy and confectionery, that would need to be discarded following publication of FDA's final rules on several food labeling actions, including this action. However, these comments did not: (1) Provide details on how these estimates were derived, (2) identify what portion of the estimated amounts are attributable to these two actions, or (3) describe what impact the discarded labels and packaging would have on the disposal of solid waste.

Based on its consideration of comments received, the agency has decided to allow additional time for companies to use up their old labels. Thus, the nutrition labeling final rules will not be effective until May 8, 1994. FDA believes there will thus be ample time for food companies to use up most of the existing labeling and packaging stocks and to incorporate labeling language that complies with FDA's regulations into their food labels. Consequently, the comments on the potential for adverse environmental effects do not affect the agency's previous determination that no significant impact on the human environment is expected and that an environmental impact statement is not required.

VI. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

VII. Paperwork Reduction Act

In the **Federal Register** of February 14, 1992 (57 FR 5398), FDA announced that the agency had submitted to the Office of Management and Budget (OMB) for its review the collection of information requirements contained in the proposed rule (November 27, 1991, 56 FR 60394) that provided, in part, for petitions regarding serving sizes. Also in the February 1992 document, FDA published its estimated annual collection of information burden.

Based on its consideration of the written comments received in response to the aforementioned **Federal Register** documents and the oral presentations made at the public hearing on food labeling, FDA modified the serving size petition requirements from those that were proposed. Those modifications were discussed in detail earlier in this final rule. Accordingly, FDA has also revised its estimated annual collection of information burden.

This final rule contains collection of information requirements that are subject to review by OMB under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507). Therefore, in accordance with 5 CFR 1320, the title, description, and respondent descriptions of the collection of information requirements are shown below with an estimate of the annual collection of information burden. Included in the estimate is the amount of time for reviewing instructions, searching existing data sources, gathering necessary information, and completion and submission of petitions.

Title: 21 CFR 101.12—Food Labeling: Serving Sizes.

Description: This final rule provides the procedures and format for the submission of petitions to the agency. Section 101.12(h) describes the information needed by FDA to evaluate the need for the change or addition requested in the petition and to

determine the appropriate reference amount for the petitioned food if the change or addition is judged as needed. The information included in these petitions will be reviewed by the agency, and a decision will be made in accordance with the criteria specified in this final rule.

Description of Respondents: Persons and businesses, including small businesses.

Estimated Annual Reporting and Recordkeeping Burden:

Section	Number of Respondents	Number of Responses per Respondent	Total Annual Responses	Average Burden per Response	Annual Burden Hours
101.12(h)	10	1	10	60	600
Total					600

FDA has submitted copies of the final rule to OMB for its review of these reporting requirements.

List of Subjects in 21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.8 is amended by revising paragraph (a) to read as follows:

§ 101.8 Labeling of food with number of servings.

(a) The label of any package of a food that bears a representation as to the number of servings contained in such package shall bear in immediate conjunction with such statement, and in the same size type as is used for such statement, a statement of the net quantity (in terms of weight, measure, or numerical count) of each such serving; however, such statement may be expressed in terms that differ from the terms used in the required statement of net quantity of contents (for example cups, tablespoons) when such differing term is common to cookery and describes a constant quantity. Such statement shall not be misleading in any particular. Where nutrition labeling information is required in accordance with the provisions of § 101.9, however, the statement of the net quantity of each serving shall be consistent with the requirements for serving size expression set forth in that section (e.g., 10 1-cup (240 milliliters) servings). A statement of the number of units in a package is not in itself a statement of the number of servings.

* * * * *

3. Section 101.9 is amended by revising paragraph (b) to read as follows:

§ 101.9 Nutrition labeling of food.

* * * * *

(b) Except as provided in § 101.9(h)(3), all nutrient and food component quantities shall be declared in relation to a serving as defined in this section.

(1) The term "serving" or "serving size" means an amount of food customarily consumed per eating occasion by persons 4 years of age or older which is expressed in a common household measure that is appropriate to the food. When the food is specially formulated or processed for use by infants or by toddlers, a serving or serving size means an amount of food customarily consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age, respectively.

(2) Except as provided in paragraphs (b)(3), (b)(4), and (b)(6) of this section and for products that are intended for weight control and are available only through a weight-control or weight-maintenance program, serving size declared on a product label shall be determined from the "Reference Amounts Customarily Consumed Per Eating Occasion" (reference amounts) that appear in § 101.12(b) using the procedures described below. For products that are both intended for weight control and available only through a weight-control program, a manufacturer may determine the serving size that is consistent with the meal plan of the program. Such products must bear a statement, "for sale only through the ———— program" (fill in the blank with the name of the appropriate weight control program, e.g., Smith's Weight Control), on the principal display panel. However, the reference amounts in § 101.12(b) shall be used for purposes of evaluating whether weight-control products that are available only through a weight-control program qualify for nutrient content claims or health claims.

(i) For products in discrete units (e.g., muffins, sliced products such as sliced bread, apples, or individually packaged products within a multiserving package), except for products that naturally vary in size such as maraschino cherries, pickles, shellfish, whole fish, and fillet of fish, serving size shall be the number of whole units that most closely approximates the reference amount for the product category. If a unit weighs 67 percent or more, but less than 200 percent of the reference amount, the serving size shall be one unit. If a unit weighs more than 50 percent but less than 67 percent of the reference amount, the manufacturer may declare one unit as one serving. If a unit weighs 200 percent or more of the reference amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion. Serving size for maraschino cherries shall be expressed as 1 cherry with the parenthetical metric measure equal to the average weight of a medium size cherry. Serving size for other products that naturally vary in size shall be expressed in the amount in oz that most closely approximates the reference amount for the product category. Manufacturers shall adhere to the requirements in paragraph (b)(5) of this section for expressing the serving size in oz.

(ii) For products in large discrete units that are usually divided for consumption (e.g., cake, pie, pizza, melon, cabbage), the serving size shall be the fractional slice of the food (e.g., 1/12 cake, 1/8 pie, 1/4 pizza, 1/4 melon, 1/6 cabbage) that most closely approximates the reference amount for the product category. In expressing the fractional slice, manufacturers shall use 1/2, 1/3, 1/4, 1/5, 1/6, or smaller fractions that can be generated by further division by 2 or 3.

(iii) For nondiscrete bulk products (e.g., breakfast cereal, flour, sugar, dry mixes, concentrates), serving size shall be the amount in household measure that most closely approximates the reference amount for the product category.

(3) The serving size for meal products and main dish products as defined in § 101.13(l) and (m) of this chapter that come in single-serving containers as defined in paragraph (b)(6) of this section shall be the entire content (edible portion only) of the package. Serving size for meal products and main dish products in multiserving containers shall be based on the reference amount applicable to the product in § 101.12(b) if the product is listed in § 101.12(b). Serving size for meal products and main dish products in multiserving containers that are not listed in § 101.12(b) shall be based on the reference amount according to § 101.12(f).

(4) A variety pack such as a package containing several varieties of single-serving units as defined in paragraph (b)(2)(i) of this section, and a product having two or more compartments with each compartment containing a different food, shall provide nutrition information for each variety or food per serving size that is derived from the reference amount in § 101.12(b) applicable for each variety or food and the procedures to convert the reference amount to serving size in paragraph (b)(2) of this section.

(5) For labeling purposes, the term "common household measure" or "common household unit" means cup, tablespoon, teaspoon, piece, slice, fraction (e.g., 1/4 pizza), ounce (oz), fluid ounce (fl oz), or other common household equipment used to package food products (e.g., jar, tray). In expressing serving size in household measures, the following rules shall be used:

(i) Cups, tablespoons, or teaspoons shall be used wherever possible and appropriate except for beverages. For beverages, a manufacturer may use fl oz. Cups shall be expressed in 1/4 or 1/3 cup increments, tablespoons in whole number of tablespoons for quantities less than 1/4 cup but greater than or equal to 1 tablespoon, and teaspoons in whole number of teaspoons for quantities less than 1 tablespoon but greater than or equal to 1 teaspoon and in 1/4 teaspoon increments for quantities less than 1 teaspoon.

(ii) If cups, tablespoons or teaspoons are not applicable, units such as piece, slice, tray, jar, and fraction shall be used.

(iii) If paragraphs (b)(5)(i) and (b)(5)(ii) of this section are not applicable, oz may be used with an appropriate visual unit of measure such as a dimension of a piece, e.g., 1 oz (28 g/about 1/2 pickle). Ounce measurements shall be expressed in 0.5 oz increments most closely approximating the reference amount, with rounding indicated by use of the term "about" (e.g., about 2.5 oz).

(iv) For nutrition labeling purposes, a teaspoon means 5 milliliters (mL); a tablespoon means 15 mL; a cup means 240 mL; 1 fluid ounce (fl oz) means 30 mL; and 1 oz in weight means 28 g.

(v) When a serving size, determined from the reference amount in § 101.12(b) and the procedures described in this section, falls exactly half way between two serving sizes, e.g., 2.5 tbsp, manufacturers shall round the serving size up to the next incremental size.

(6) A product that is packaged and sold individually and that contains less than 200 percent of the applicable reference amount shall be considered to be a single-serving container, and the entire content of the product shall be labeled as one serving except for products that have reference amounts of 100 g (or mL) or larger, manufacturers may decide whether a package that contains more than 150 percent but less than 200 percent of the reference amount is 1 or 2 servings. Packages sold individually that contain 200 percent or more of the applicable reference amount may be labeled as a single-serving if the entire content of the package can reasonably be consumed at a single-eating occasion.

(7) A label statement regarding a serving shall be the serving size expressed in common household measures as set forth in paragraphs (b)(2) through (b)(6) of this section and shall be followed by the equivalent metric quantity in parenthesis (fluids in mL and all other foods in g) except for single-serving containers. For a single-serving container, the parenthetical metric quantity, which will be presented as part of the net weight statement on the principal display panel, is not required except where nutrition information is required on a drained weight basis according to § 101.9(b)(9). The g quantity equivalent to the household measure should be rounded to the nearest whole number except for quantities that are less than 5 g. The g quantity between 2 and 5 g should be rounded to the nearest 0.5 g and the g quantity less than 2 g should be expressed in 0.1-g increments. In addition, serving size may be declared in oz and fl oz, in parenthesis, following the metric measure separated by a slash where other common household measures are used as the primary unit for serving size, e.g., 1 slice (28 g/1 oz) for sliced bread. The oz quantity equivalent to the metric quantity should be expressed in 0.1 oz increments. If a manufacturer elects to use abbreviations for units, the following abbreviations shall be used: tbsp for tablespoon, tsp for teaspoon, g for gram, mL for milliliter, oz for ounce, and fl oz for fluid ounce. To promote uniformity in label serving sizes in household measures declared by different manufacturers, FDA has provided Guidelines for Determining the Gram Weight of the Household Measure. The guidelines can be obtained from Division of Nutrition (HFF–260), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

(8) Determination of the number of servings per container shall be based on the serving size of the product determined by following the procedures described in this section. The number of servings shall be rounded to the nearest whole number except for the number of servings between 2 and 5 servings and random weight products. The number of servings between 2 and 5 servings shall be rounded to the nearest 0.5 serving. Rounding should be indicated by the use of the term "about" (e.g., about 2 servings, about 3.5 servings). When the serving size is required to be expressed on a drained solids basis and the number of servings vary because of a natural variation in unit size (e.g., maraschino cherries, pickles), the manufacturer may state the typical number of servings per container (e.g., usually 5 servings). For random weight products, a manufacturer may declare "varied" for the number of servings per container provided the nutrition information is based on the reference amount expressed in oz. The manufacturer may provide the typical number of servings in parenthesis following the "varied" statement.

(9) The declaration of nutrient and food component content shall be on the basis of food as packaged or purchased with the exception of raw fish covered under § 101.42 (see § 101.44), packaged

single-ingredient products that consist of fish or game meat as provided for in paragraph (j)(11) of this section, and of foods that are packed or canned in water, brine, or oil but whose liquid packing medium is not customarily consumed (e.g., canned fish, maraschino cherries, pickled fruits, and pickled vegetables). Declaration of nutrient and food component content of raw fish shall follow the provisions in § 101.45. Declaration of nutrient and food component content of foods that are packed in liquid but the liquid packing medium is not customarily consumed, shall be based on the drained solids.

(10) Another column of figures may be used to declare the nutrient and food component information,

(i) Per 100 g or 100 mL or per 1 oz or 1 fl oz of the food as packaged or purchased.

(ii) Per one unit if the serving size of a product in discrete units in a multiserving container is more than one unit.

(iii) Per cup popped for popcorn in a multiserving container.

(11) If a product is promoted on the label, labeling, or advertising for a use that differs in quantity by twofold or greater from the use upon which the reference amount in § 101.12(b) was based (e.g., liquid cream substitutes promoted for use with breakfast cereals), the manufacturer shall provide a second column of nutrition information based on the amount customarily consumed in the promoted use, in addition to the nutrition information per serving derived from the reference amount in § 101.12(b), except that nondiscrete bulk products that are used primarily as ingredients (e.g., flour, sweeteners, shortenings, oils), or traditionally used for multipurposes (e.g., eggs, butter, margarine), and multipurpose baking mixes are exempt from this requirement.

* * * * *

4. Section 101.12 is added to subpart A to read as follows:

§ 101.12 Reference amounts customarily consumed per eating occasion.

(a) The general principles and factors that the Food and Drug Administration (FDA) considered in arriving at the reference amounts customarily consumed per eating occasion (reference amounts) which are set forth in paragraph (b) of this section, are that:

(1) FDA calculated the reference amounts for persons 4 years of age or older to reflect the amount of food customarily consumed per eating occasion by persons in this population group. These reference amounts are based on data set forth in appropriate national food consumption surveys.

(2) FDA calculated the reference amounts for an infant or child under 4 years of age to reflect the amount of food customarily consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age, respectively. These reference amounts are based on data set forth in appropriate national food consumption surveys. Such reference amounts are to be used only when the food is specially formulated or processed for use by an infant or by a child under 4 years of age.

(3) An appropriate national food consumption survey includes a large sample size representative of the demographic and socioeconomic characteristics of the relevant population group and must be based on consumption data under actual conditions of use.

(4) To determine the amount of food customarily consumed per eating occasion, FDA considered the mean, median, and mode of the consumed amount per eating occasion.

(5) When survey data were insufficient, FDA took various other sources of information on serving sizes of food into consideration. These other sources of information included:

(i) Serving sizes used in dietary guidance recommendations or recommended by other authoritative systems or organizations;

(ii) Serving sizes recommended in comments;

(iii) Serving sizes used by manufacturers and grocers; and

(iv) Serving sizes used by other countries.

(6) Because they reflect the amount customarily consumed, the reference amount and, in turn, the serving size declared on the product label are based on only the edible portion of food, and not bone, seed, shell, or other inedible components.

(7) The reference amount is based on the major intended use of the food (e.g., milk as a beverage and not as an addition to cereal).

(8) The reference amounts for products that are consumed as an ingredient of other foods, but that may also be consumed in the form in which they are purchased (e.g., butter), are based on use in the form purchased.

(9) FDA sought to ensure that foods that have similar dietary usage, product characteristics, and customarily consumed amounts have a uniform reference amount.

(b) The following reference amounts shall be used as the basis for determining serving sizes for specific products:

TABLE

REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EA

Product category	Reference a
Cereals, dry instant	15 g
Cereals, prepared, ready-to-serve	110 g
Other cereal and grain products, dry ready-to-eat, e.g., ready-to-eat cereals, cookies, teething biscuits, and toasts.	7 g for infants and 20 g for toddlers fo others.
Dinners, desserts, fruits, vegetables or soups, dry mix	15 g
Dinners, desserts, fruits, vegetables or soups, ready-to-serve, junior type.	110 g
Dinners, desserts, fruits, vegetables or soups, ready-to-serve, strained type.	60 g
Dinners, stews or soups for toddlers, ready-to-serve	170 g
Fruits for toddlers, ready-to-serve	125 g
Vegetables for toddlers, ready-to- serve	70 g
Eggs/egg yolks, ready-to-serve	55 g
Juices, all varieties	120 mL

gums that weigh more than the reference amount that can reasonably be consumed at a single-eating occasion will be one unit.
h as flesh products from deer, bison, rabbit, quail, wild turkey, geese, ostrich, etc.
the solids and liquids are customarily consumed (e.g., canned chopped clam in juice).
ucts that consist of fish or game meat as provided for in § 101.9(b)(j)(11).
ed in Appendices A and B to the regulation entitled "Food Labeling; Guidelines for Voluntary Nutrition Labeling; and Identification of on" (56 FR 60880 as amended 57 FR 8174, March 6, 1992).

(c) The reference amount of a product that requires cooking or the addition of water or other ingredients shall be the amount required to prepare one reference amount of the final product as established in paragraph (b) of this section.

(d) The reference amount for an imitation or substitute food or altered food such, as a "low calorie" version, shall be the same as for the food for which it is offered as a substitute.

(e) If a food is modified by incorporating air (aerated), and thereby the density of the food is lowered by 25 percent or more in weight than that of an appropriate reference regular food as described in § 101.13(j)(1)(ii)(A), and the reference amount of the regular food is in g, the manufacturer may determine the reference amount of the aerated food by adjusting for the difference in density of the aerated food relative to the density of the appropriate reference food provided that the manufacturer will show FDA detailed protocol and records of all data that were used to determine the density-adjusted reference amount for the aerated food. The reference amount for the aerated food shall be rounded to the nearest 5 g increment. Such products shall bear a descriptive term indicating that extra air has been incorporated (e.g., whipped, aerated). The density-adjusted reference amounts described above may not be used for cakes except for cheese cake. The differences in the densities of different types of cakes having different degrees of air incorporation have already been taken into consideration in determining the reference amounts for cakes in § 101.12(b). In determining the difference in density of the aerated and the regular food, the manufacturer shall adhere to the following:

(1) The regular and the aerated product must be the same in size, shape, and volume. To compare the densities of products having nonsmooth surfaces (e.g., waffles), manufacturers shall use a device or method that ensures that the volumes of the regular and the aerated products are the same.

(2) Sample selections for the density measurements shall be done in accordance with the provisions in § 101.9(e).

(3) Density measurements of the regular and the aerated products shall be conducted by the same trained operator using the same methodology (e.g., the same equipment, procedures, and techniques) under the same conditions.

(4) Density measurements shall be replicated a sufficient number of times to ensure that the average of the measurements is representative of the true differences in the densities of the regular and the "aerated" products.

(f) The reference amount for products that represent two or more foods packaged and presented to be consumed together (e.g., peanut butter and jelly, cracker and cheese pack, pancakes and syrup) shall be the sum of the reference amounts for individual foods in the package if the reference amount for the product is not listed in paragraph (b) of this section.

(g) The reference amount set forth in paragraphs (b) through (f) of this section shall be used in determining whether a product meets the criteria for nutrient content claims, such as "low calorie," and for health claims. If the serving size declared on the product label differs from the reference amount, and the product meets the criteria for the claim only on the basis of the reference amount, the claim shall be followed by a statement that sets forth the basis on which the claim is made. That statement shall include the reference amount as it appears in § 101.12(b) followed, in parenthesis, by the amount in common household measure if the reference amount is expressed in measures other than common household measures (e.g., for a beverage, "Very low sodium, 35 mg or less per 240 mL (8 fl oz)").

(h) The Commissioner of Food and Drugs, either on his or her own initiative or in response to a petition submitted pursuant to part 10 of this chapter, may issue a proposal to establish or amend a reference amount in § 101.12(b). A petition to establish or amend a reference amount shall include:

(1) Objective of the petition;

(2) A description of the product;

(3) A complete sample product label including nutrition label, using the format established by regulation;

(4) A description of the form (e.g., dry mix, frozen dough) in which the product will be marketed;

(5) The intended dietary uses of the product with the major use identified (e.g., milk as a beverage and chips as a snack);

(6) If the intended use is primarily as an ingredient in other foods, list of foods or food categories in which the product will be used as an ingredient with information on the prioritization of the use;

(7) The population group for which the product will be offered for use (e.g., infants, children under 4 years of age);

(8) The names of the most closely-related products (or in the case of foods for special dietary use and imitation or substitute foods, the names of the products for which they are offered as substitutes);

(9) The suggested reference amount (the amount of edible portion of food as consumed, excluding bone, seed, shell, or other inedible components) for the population group for which the product is intended with full description of the methodology and procedures that were used to determine the suggested reference amount. In determining the reference amount, general principles and factors in paragraph (a) of this section should be followed.

(10) The suggested reference amount shall be expressed in metric units. Reference amounts for fluids shall be expressed in milliliters (mL). Reference amounts for other foods shall be expressed in grams (g) except when common household units such as cups, tablespoons, and teaspoons, are more appropriate or are more likely to promote uniformity in serving sizes declared on product labels. For example, common household measures would be more appropriate if products within the same category differ substantially in density such as frozen desserts.

(i) In expressing the reference amounts in mL, the following rules shall be followed:

(A) For volumes greater than 30 mL, the volume shall be expressed in multiples of 30 mL.

(B) For volumes less than 30 mL, the volume shall be expressed in mL equivalent to a whole number of teaspoons or one tablespoon, i.e., 5, 10, or 15 mL.

(ii) In expressing the reference amounts in g, the following general rules shall be followed:

(A) For quantities greater than 10 g, the quantity shall be expressed in nearest 5 g increment.

(B) For quantities less than 10 g, exact g weights shall be used.

(11) A petition to create a new subcategory of food with its own reference amount shall include the following additional information:

(i) Data that demonstrate that the new subcategory of food will be consumed in amounts that differ enough from the reference amount for the parent category to warrant a separate reference amount. Data must include sample size; and the mean, standard deviation, median, and modal consumed amount per eating occasion for the petitioned product and for other products in the category, excluding the petitioned product. All data must be derived from the same survey data.

(ii) Documentation supporting the difference in dietary usage and product characteristics that affect the consumption size that distinguishes the

petitioned product from the rest of the products in the category.

(12) A claim for categorical exclusion under § 25.24 of this chapter or an environmental assessment under § 25.31 of this chapter; and

(13) In conducting research to collect or process food consumption data in support of the petition, the following general guidelines should be followed.

(i) Sampled population selected should be representative of the demographic and socioeconomic characteristics of the target population group for which the food is intended.

(ii) Sample size (i.e., number of eaters) should be large enough to give reliable estimates for customarily consumed amounts.

(iii) The study protocol should identify potential biases and describe how potential biases are controlled for or, if not possible to control, how they affect interpretation of results.

(iv) The methodology used to collect or process data including study design, sampling procedures, materials used (e.g., questionnaire, interviewer's manual), procedures used to collect or process data, methods or procedures used to control for unbiased estimates, and procedures used to correct for nonresponse, should be fully documented.

(14) A statement concerning the feasibility of convening associations, corporations, consumers, and other interested parties to engage in negotiated rulemaking to develop a proposed rule consistent with the Negotiated Rulemaking Act (Pub. L. 101–648).

Dated: October 27, 1992.

Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms; Definitions of Nutrient Content Claims for the Fat, Fatty Acid, and Cholesterol Content of Food

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending its food labeling regulations to: (1) Provide definitions for specific nutrient content claims using the terms "free," "low," "lean," "extra lean," "good source," "high," "reduced," "light" or "lite," "less," "fewer," and "more" and provide for their use on the food label; (2) provide for the use of implied nutrient content claims; (3) define and provide for the use of the term "fresh;" and (4) address the use of the terms "natural" and "organic." This action is part of the food labeling initiative of the Secretary of Health and Human Services (the Secretary) and in response to the Nutrition Labeling and Education Act of 1990 (the 1990 amendments).

EFFECTIVE DATE: February 14, 1994, except §§ 101.10 and 101.13(q)(5) concerning restaurant firms consisting of 10 or less individual restaurant establishments for whom these sections will become effective on February 14, 1995.

SUPPLEMENTARY INFORMATION:

I. Introduction

A. Background

In the **Federal Register** of November 27, 1991 (56 FR 60421), FDA published a proposed rule (entitled "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms" hereinafter referred to as the general principles proposal) to: (1) Define nutrient content claims (also known as descriptors) and to provide for their use on foods labels; (2) define specific nutrient content claims that include the terms "free," "low," "source," "reduced," "light" or "lite," and "high"; (3) provide for comparative claims using the terms "less," "fewer," and "more"; (4) set forth specific requirements for sodium and calorie claims; (5) establish procedures for the submission and review of petitions regarding the use of nutrient content claims; (6) revise § 105.66 (21 CFR 105.66), to solely cover foods for special dietary use in reducing or maintaining body weight; (7) establish criteria for the appropriate use of the term "fresh;" and (8) address the use of the term "natural." A document correcting various editorial errors in that proposed rule was published in the **Federal Register** of March 6, 1992 (57 FR 8189).

In the same issue of the **Federal Register** (56 FR 60478), FDA also published a proposed rule (entitled "Food Labeling: Definitions of Nutrient Content Claims for the Fat, Fatty Acid, and Cholesterol Content of Food" hereinafter referred to as the fat/cholesterol proposal) to define and provide for the proper use of the nutrient content claims "fat free," "low fat," "reduced fat," "low in saturated fat," "reduced saturated fat," "cholesterol free," "low cholesterol," and "reduced cholesterol." A document correcting various editorial errors in the fat/cholesterol proposal was also published in the **Federal Register** of March 6, 1992 (57 FR 8177). The agency published the fat/cholesterol proposal as a separate document from the general principles proposal, even though it had based the two documents on the same statutory provisions, because it had published a tentative final rule on cholesterol content claims in the **Federal Register** of July 19, 1990 (55 FR 29456). FDA included proposed definitions for fat and fatty acid content claims in the fat/cholesterol proposal because of the interrelationship among these nutrients and cholesterol in the etiology of cardiovascular disease.

Also in the same issue of the **Federal Register** (56 FR 60507), FDA published a proposed rule (entitled "Food Labeling: 'Cholesterol Free,' 'Low Cholesterol,' and '——— Percent Fat Free' Claims") to define "cholesterol free" and "low cholesterol" and to provide for the proper use of these terms and the term "——— percent fat free." The proposed rule was intended to ensure on an interim basis that these terms are not used in a manner that is misleading to consumers.

The general principles proposal (56 FR 60421) and the fat/cholesterol proposal (56 FR 60478) were issued as part of the agency's food label reform initiative and in response to the 1990 amendments (Pub. L. 101-535). The food label reform began in 1989 when FDA published an advance notice of proposed rulemaking (ANPRM) that announced a major initiative concerning the use of food labeling as a means for promoting sound nutrition. The following year (November 8, 1990), the President signed the 1990 amendments into law. This legislation clarified and strengthened FDA's legal authority to require nutrition labeling on foods and to establish those circumstances whereby claims can be made about nutrients in foods. Now as FDA prepares to implement the new regulations, the agency reiterates that the 1990 amendments have three basic objectives. They are: (1) To make available nutrition information that can assist consumers in selecting foods that can lead to healthier diets, (2) to eliminate consumer confusion by establishing definitions for nutrient content claims that are consistent with the terms defined by the Secretary, and (3) to encourage product innovation through the development and marketing of nutritionally improved foods. With these goals in mind, the agency believes that the new regulations will reestablish the credibility of the food label.

With respect to nutrient content claims, the 1990 amendments amended the Federal Food, Drug, and Cosmetic Act (the act) by adding section 403(r)(1)(A) of the act (21 U.S.C. 343(r)(1)(A)) which states that a food is misbranded if it bears a claim in its label or labeling that either expressly or implicitly characterizes the level of any nutrient of the type required to be declared as part of the nutrition labeling, unless such claim is made in accordance with section 403(r)(2).

The agency received over 1,800 comments in response to the general principles proposal, and 500 comments in response to the fat/cholesterol proposal. Each comment addressed one or more of the provisions in these proposals. The comments were from a variety of sources including consumers, health care professionals, trade organizations, manufacturers, consumer advocacy organizations, foreign governments, and State and local governments. Many of the comments generally agreed with one or more provisions of the proposal, without providing other grounds for support other than those provided by FDA in the preamble to the proposal. Several comments addressed issues covered by other proposals that are a part of this overall food labeling initiative and will be addressed in those final documents, while other comments addressed issues

outside the scope of the proposal and will not be discussed here.

A number of comments to the general principles and fat/cholesterol proposals suggested modifications in, or were opposed to, various provisions of the proposals. Because the general principles governing both documents are identical, and because the issues raised in comments responding to the two proposals are similar, FDA has chosen to address the comments on, and to establish regulations based on, both proposals in this single document. The agency will summarize the issues raised in the comments and address them in this document.

The agency also notes that it received about 125 comments on the tentative final rule on cholesterol content claims after the closing date for comments of August 20, 1990. These comments were not addressed in the fat/cholesterol proposal. However, the agency has reviewed these comments and is also responding to them in this final rule.

As for the third proposal on cholesterol claims and "——— percent fat free," FDA has concluded that this final rule will provide adequate assurance to consumers that these terms are not used in a misleading manner. Therefore, the agency is announcing that it is withdrawing this proposal. Comments that were submitted on this proposal (Docket No. 84N–153A) have been considered in the development of this final rule. They will be addressed with the other comments on the general principles proposal and the fat/cholesterol proposal in this final rule.

B. Foods for Special Dietary Use

In 1978, FDA promulgated regulations in § 105.66 pertaining to the use of the terms "low calorie" and "reduced calorie" on foods represented as or purporting to be for special dietary use in the maintenance or reduction of caloric intake or body weight. Under the 1990 amendments, FDA is defining the terms "low" and "reduced" as nutrient content claims that identify the level of a nutrient in a food intended for consumption by the general population and is adopting specific definitions for the terms "low calorie" and "reduced calorie." To reflect these actions, the agency is revising § 105.66 to delete the provisions that define "low calorie" and "reduced calorie." Because § 105.66 was adopted under the authority of section 403(j) of the act, these revisions must be made in accordance with the formal rulemaking procedures in section 701(e) of the act (21 U.S.C. 371(e)). Under these procedures, there is an opportunity to object to a final rule and to request a public hearing based upon such objection. Such an opportunity is not provided as part of the notice-and-comment rulemaking procedures that are appropriate for most of the rest of the rulemaking that FDA is doing in response to the 1990 amendments. Therefore, for administrative convenience, FDA is publishing the final rule amending § 105.66 elsewhere in this issue of the Federal Register.

II. General Principles for Nutrient Content Claims

A. Legal Basis

FDA has the authority to issue this final rule regarding nutrient content claims under sections 201(n) (21 U.S.C. 321(n)), 403(a), 403(r), and 701(a) of the act. These sections authorize the agency to adopt regulations that prohibit labeling that: (1) Is false or misleading in that it fails to reveal facts that are material in light of the representations that are made with respect to consequences that may result from use of the food, or (2) uses terms to characterize the level of any nutrient in a food that has not been defined by regulation by FDA.

B. Scope

Section 403(r)(1)(A) of the act provides that claims, either expressed or implied, that characterize the level of a nutrient which is of a type required to be declared in nutrition labeling may not be made on the label or in labeling of any food intended for human consumption that is offered for sale unless the claim is made in accordance with section 403(r)(2). In the general principles proposal, the agency proposed to incorporate this general statutory requirement into proposed § 101.13(a) and (b) and to establish a new § 101.13 and the applicable regulations in part 101, subpart D (21 CFR part 101) as the provisions governing nutrient content claims.

1. One comment stated that the claims that are subject to the proposed regulations, which implement section 403(r)(1)(A) of the act, are appropriately called "nutrient descriptors," not "nutrient content" claims as proposed by FDA. The comment pointed out that the statutory language of the 1990 amendments does not include the phrase "nutrient content" claim. It stated that the words in section 403(r)(1)(A) of the act refer to a covered claim as a claim that "characterizes the level of any nutrient * * *." The comment's purpose in contrasting the wording of the proposal and that of the statute is to limit the applicability of the regulation to claims about the level of a nutrient and to exclude statements about amounts of nutrients. The comment stated that simple factual information about the nutrient content of a food, for which no characterizing claims are made, is explicitly excluded from regulation under section 403(r)(1)(A) of the act. It said that the last sentence in section 403(r)(1) of the act provides that a statement of the type contained in nutrition labeling—for example, that a food contains 25 calories per serving, or 10 percent of the U.S. Recommended Daily Allowance (U.S. RDA) for vitamin C, or 50 milligrams (mg) of sodium—is not a claim characterizing the level of the nutrient. The comment requested that to assure that the regulations for section 403(r)(1)(A) of the act claims are not misunderstood to extend to nutrient statements that do not "characterize the level of a nutrient," all references to "nutrient content" claims be redesignated to "nutrient descriptors" or "nutrient descriptor claims."

The agency advises that while it can agree that the terms "nutrient descriptor" and "nutrient descriptor claims" may be used to describe the claims subject to section 403(r)(1)(A) of the act and these regulations, it does not agree that the scope of the statute and the regulations excludes statements of the amount of a nutrient in a food. The distribution the comment draws between "nutrient descriptors" and "nutrient content" claims is unpersuasive. In fact, one of the sponsors of the 1990 amendments in the Senate specifically used the term "nutrition content claim" to refer to claims covered under section 403(r)(1)(A) (136 Cong. Rec. S16608 (October 24, 1990)). Moreover, the statement in section 403(r)(1) of the act referred to by the comment as excluding from coverage statements of the type contained in nutrition labeling, in fact excludes "a statement of the type required by paragraph (q) that appears as part of the nutrition information required or permitted by such paragraph * * *." FDA stated in the general principles proposal (56 FR 60421 at 60424), that the legislative history of this provision specifically states that the identical information will be subject to the descriptor requirements if it is included in a statement in another portion of the label (136 Congressional Record H5841 (July 30, 1990)). In addition, section 403(r)(2)(E) of the act specifically exempts from the limitations on claims established in section 403(r)(2)(A)(i) through (r)(2)(A)(v), "a statement in the label or labeling of food which describes the percentage of vitamins and minerals in

the food which describes the percentage of such vitamins and minerals recommended for daily consumption by the Secretary." If such declarations as "10 percent of the U.S. RDA for vitamin C" were not within the scope of section 403(r)(1)(A) of the act, there would have been no need for Congress to provide a specific exemption for such claims. Furthermore, section 3(b)(1)(A)(iv) of the 1990 amendments provides that the mandated regulations "shall permit statements describing the amount and percentage of nutrients in food which * * * are consistent with the terms defined in section 403(r)(2)(A)(i) of such Act." Again, if statements of the amount and percentage of nutrients were not subject to section 403(r)(1)(A) of the act, there presumably would have been no need for Congress to express its desire that such claims be permitted by the regulations. Accordingly, FDA concludes that section 403(r)(1)(A) of the act and therefore these final regulations apply to statements of the amount of a nutrient in food as well as to statements of the level of a nutrient in food. Thus, FDA's use of the term "nutrient content claims" is fully consistent with the act.

2. In proposed § 101.13(b)(3), FDA stated that no nutrient content claims could be made on foods specifically intended for infants and children less than 2 years of age.[1] A few comments stated that the prohibition was inconsistent with the overall intent of the 1990 amendments, which is to avoid consumer confusion by providing relevant and useful information to consumers by which they can make informed food choices. The comments said that such a prohibition would unfairly restrict nutrient content claims on foods primarily intended for infants and children less than two years of age while allowing such claims on products that, though aimed primarily at adults and older children, are actively promoted either on the label or in the advertising as being for use by infants or children less than 2 years of age. Although the comments recognized the validity of this prohibition with respect to certain nutrients, they requested that the agency provide an exception from this general prohibition for claims about other nutrients. Specifically, the comments requested changes that would, among other things, allow "no salt added" and "no sugar added" claims, permit "high protein cereal" to be so labeled, allow the percentage of the Reference Daily Intake (RDI) of a vitamin or mineral to be stated on the principle display panel (PDP), allow claims about fortification of the product with vitamins and minerals, and allow products to be labeled with a statement of identity that includes an ingredient that is a standardized food whose name includes a claim (e.g., "juice with low fat yogurt") without the normal referral statements required for nutrient content claims. The comments maintained that these exceptions would place infant foods on a par with foods intended for the general population that are promoted for infants and children less than 2 years of age and would allow continuation of the long standing practice of providing information relevant to the perceived special nutritional needs of this group.

The comments added that permitting "no sugar added" and "no salt added" claims on these foods is consistent with recent research that shows that sugar and salt are not necessary for a baby's palate, and that feeding sweetened or salted foods to infants can enhance their preference for such foods which is carried into adult eating patterns. Such "no salt added" and "no sugar added" claims, the comments said, would also allow manufacturers to highlight products that are consistent with dietary recommendations for infants and children less than 2 years of age provided over the past 11 years by health authorities, including the American Academy of Pediatrics, the U.S. Surgeon General, and U.S. Department of Agriculture (USDA)/FDA Dietary Guidelines.

In response to the comments, FDA has reconsidered the propriety of nutrient content claims on foods specifically intended for infants and children less than 2 years of age. The agency now believes that the complete prohibition of nutrient content claims on foods for infants and children less than 2 years of age may have been overly broad. Although current dietary recommendations for Americans do not include infants and children less than 2 years of age, there is no basis in the 1990 amendments to limit nutrient content claims to only foods intended for the population over the age of 2. In addition, the agency cannot discount the possibility that information may be developed that will allow the agency to define specific claims on the level of a nutrient in the food that are appropriate for foods for infants and children less than 2 years of age. Such claims are subject to the requirements of section 403(r) of the act.

Accordingly, the agency has revised new § 101.13(b)(3) to state that no nutrient content claims may be made on foods for infants and children less than 2 years of age unless a regulation specifically authorizing such a claim has been established in part 101, subpart D, among certain other parts of the regulations. Interested persons may submit a petition under new § 101.69 with appropriate information that would provide a basis on which the agency could determine that a specific nutrient content claim would be appropriate for foods for infants and children less than 2 years of age.

The agency also notes that it can permit, by regulation under section 403(j) of the act, claims that are made because of the special dietary usefulness of the food. The agency intends to use its authority under section 403(j) and (r) of the act to regulate foods for infants and children less than 2 years of age. In evaluating a petition for the use of a claim, it will determine under which authority of the act the claim is appropriately regulated. Accordingly, the agency is including in new § 101.13(b)(3) a reference to regulations in part 105 among those regulations that permit claims on foods for infants and children less than 2 years of age. In addition, in the general principles proposal, FDA stated that the regulations in part 107, issued under the authority of section 412 of the act (21 U.S.C. 350), permit certain nutrient content claims on infant formulas. For clarity, FDA has also included part 107 among the regulations permitting claims in new § 101.13(b)(3).

The comments that requested permission to make certain claims did not provide, nor has the agency developed, a sufficient basis on which to conclude that any of the nutrient content claims that FDA is defining, or any other claims, are appropriate for food specifically intended for infants and children less than 2 years of age. Although the agency is not prohibiting the statement of identity, "juice with low fat yogurt" because low fat yogurt is a standardized food and the statement of identity accurately characterizes the product, the agency notes that the other statements about the fat content of a product would be inappropriate on a food intended for infants and children less than 2 years of age. Such a food would be inconsistent with the guidance provided by various health authorities, which was noted in the general principles proposal and

[1] The agency notes that in the comments on the mandatory nutrition labeling proposal, one comment stated that the term "toddler" was improperly used. In the final rule for mandatory nutrition labeling, the agency agrees with this comment and is replacing the term "toddler" with the phrase "children less than 2 years of age". The term "toddler" was also used throughout the nutrient content claims proposal. Therefore, for clarity and consistency, the agency is using the phrase "children less than two years of age" in lieu of the term "toddler" in this final rule.

published in a report by the National Heart, Lung, and Blood Institute, National Cholesterol Education Program (NCEP) (Ref. 1), that fat and cholesterol should not be restricted in the diets of infants.

The agency has also considered the request to authorize the use of "no sugar added" and "no salt added" claims on foods specifically intended for infants and children less than 2 years of age. The terms "no sugar added" and "no salt added" have been defined as nutrient content claims for adult foods in §§ 101.60(c)(2) and 101.61(c)(2) and imply that the food is either "low" or "reduced" in calories or sodium, respectively. However, because dietary guidelines urging Americans to moderate their intake of sodium and salt are specifically for adults and children over 2 years of age, claims on foods intended specifically for infants and children less than 2 years of age are not appropriate. Therefore, the agency is not granting this request.

However, terms "unsweetened" and "unsalted" can be viewed differently. In the general principles proposal (56 FR 60421 at 60437), the agency cited the September 22, 1978, final rule on label statements for special dietary foods (43 FR 43238). In that final rule, FDA concluded that the term "unsweetened" was a factual statement about an organoleptic property of a food. The general principles proposal stated that the agency was not aware of any reason to change this view. Although the agency did not propose in the general principles proposal to define the terms "unsweetened" for foods intended specifically for infants and children less than 2 years of age the agency considers that this statement on baby food, as on adult food, is not intended as a nutrient content claim but as a taste claim. As such it is consistent with the recommendations of the American Academy of Pediatrics (Ref. 33) and the Surgeon General's report (Ref. 4) that sugar should be added sparingly, if at all, to foods prepared for normal infants. Consequently, the agency believes that highlighting that a food is unsweetened may provide useful information about the organoleptic properties of the food. Accordingly, the agency is adding foods intended specifically for infants and children less than 2 years of age to the exceptions provided in § 101.60(c)(3) for the term "unsweetened" as a factual statement.

Similarly, the agency believes that a statement that the food is "unsalted" on foods for infants and children less than 2 years of age can also be viewed as a statement about the organoleptic properties of the food. This term is also consistent with the recommendation from the same health authorities, noted in the comments, that, similar to sweetness, a salty taste is not necessary for an infant's palate. The agency recognizes that although the word "sweet" is used exclusively to identify a taste, the word "salt" may be associated with the level of a nutrient or with the taste of a food. However, consistent with the use of the word "unsweetened" as a statement of taste, the agency is permitting the term "unsalted" to be used on foods intended exclusively for infants and children less than 2 years of age. The agency is providing in § 101.61(c)(3) that "unsalted" may be used on these foods provided that it refers only to the taste of the food and is not otherwise false and misleading.

Finally, in keeping with section 403(r)(2)(E) of the act as amended, which permits, without further definition, label statements that describe the percentage of vitamins and minerals in the food relative to the RDI, the agency concludes that it is appropriate to permit statements of this type on foods intended specifically for infants and children less than 2 years of age. Elsewhere in this issue of the **Federal Register**, FDA is listing values that may be used as RDI's specifically for infants and for children under 4 years of age. These reference amounts provide an appropriate basis for label statements on foods intended specifically for infants and children less than 2 years of age that describe the percentage of vitamins and minerals relative to the RDI. Accordingly, the agency is clarifying its intentions by amending new § 101.13(q)(3) to specifically include foods for infants and children less than 2 years of age among those that may bear a percent RDI statement.

The agency has not prohibited claims on foods that are promoted for infants and children under the age of 2 but that are intended primarily for adults and older children. However, the agency cautions that any nutrient content claims made on such products in association with a statement about use of the food for infants and children under the age of 2 would be misleading under section 403(r) of the act unless such claim has specifically been permitted for such a population by regulation.

C. Labeling Mechanics

The 1990 amendments do not include specific limits on the prominence of nutrient content claims. However, FDA did propose certain requirements on how claims are to be presented. In the general principles proposal (56 FR 60421 at 60424), FDA proposed to require in § 101.13(f) that a nutrient content claim be, in type size and style, no larger than the statement of identity. The agency stated that this proposed requirement would ensure that descriptors are not given undue prominence. The agency proposed this requirement under section 403(f) of the act and under its general authority under section 403(r). Section 403(f) of the act states that a food is misbranded if any statement required by or under the authority of the act is not placed on the label with such conspicuousness, as compared to other words, statements, designs, or devices, as to render it likely to be understood by the ordinary consumer.

Section 403(r)(2)(B) of the act states that if a nutrient content claim is made, the label or labeling of the food shall contain, prominently and in immediate proximity to such claim, a statement referring the consumer to the nutrition label (i.e., "See ———— for nutrition information"). FDA proposed to incorporate this requirement in § 101.13(g).

Section 403(r)(2)(B) of the act requires that the referral statement appear prominently, but it does not contain specific requirements such as to type size or style. However, section 403(r)(2)(A)(iii) through (r)(2)(A)(v) of the act require that statements that disclose the level of fat, saturated fat, or cholesterol, which must be presented in conjunction with certain nutrient content claims, "have appropriate prominence which shall be no less than one-half the size of the claim." For consistency and because the referral statement and the statement disclosing the level of another nutrient must both be in immediate proximity to the claim, and therefore adjacent to one another, the agency tentatively concluded that these statements should be of the same type size. Therefore, the agency proposed in § 101.13(g)(1) that the referral statement be in type one-half that of the claim, but in no case less than one-sixteenth of an inch, consistent with other minimum type size requirements for mandatory label information.

3. Many comments stated that no type size requirements for either nutrient content claims or referral statements (other than those specifically included in section 403(r)(2)(A)(iii) through (r)(2)(A)(iv)) are mandated by the 1990 amendments, and that the agency should not impose requirements beyond those included in these amendments.

While the 1990 amendments do not specify type size requirements for nutrient content claims or for the

referral statement, the act must be read as a whole. Section 403(f) of the act requires that information required under the act be placed on the label with such conspicuousness as to render it likely to be read. FDA has, therefore, included those prominence requirements in these regulations that it finds necessary to ensure that this requirement is satisfied with respect to the information required under the 1990 amendments.

1. Relationship of size of nutrient content claim to statement of identity

4. Some comments suggested that the type size for claims be limited to a size no larger than the most prominent type size on the PDP. Some comments suggested that the type size should not exceed either the size of, or one-half the size of, the largest type or brand name. Some of these comments stated that these alternatives will allow manufacturers more flexibility and be more in line with the Executive Order 12291. Several comments stated that there is no reason to connect type size of the nutrient content claim to that of the statement of identity because if the nutrient content claim is disproportionately large, the statement of identity as well as other mandatory information on the PDP, such as net quantity of contents, will be so obscured or small as to violate existing section 403(f) of the act.

The agency rejects these comments. The nutrient content claim and the statement of identity are two of the most important pieces of information on the PDP. Given the limited amount of space on the PDP, the agency finds that it is necessary to link the size of the two pieces of information, so that manufacturers, can, and will, give appropriate prominence to each of them in planning their labels. The options suggested by the comments to unlink the size of the nutrient content claim from the statement of identity could result in a claim being unduly prominent. It would not be consistent with the goal of adopting regulations for the efficient enforcement of the act if the agency's regulations created a situation in which violations of the act were likely to develop. Thus, the agency rejects those options. However, the agency does agree that more flexibility with respect to the size of the nutrient content claim is appropriate.

5. Several comments stated that claims should have maximum prominence and be permitted to be of a type size greater than the statement of identity, especially when the claim is included in a brand name, since claims both provide important information to the consumer and serve to draw consumer attention to a specific product among other similar products. Several comments stated that the claim should not be more than twice the size of the statement of identity to provide for flexibility in communicating the claim effectively. Some comments stated that this alternative will allow manufacturers more flexibility and be more in line with the Executive Order 12291.

FDA recognizes the concerns expressed in these comments. FDA has reconsidered the proposed limit on type size for nutrient content claims and concludes that the proposed limit may unduly restrict the effectiveness of claims. FDA is concerned that, as a result, the incentives for manufacturers to innovate and improve their food products may be reduced. As some comments pointed out, style and format play important roles in effective marketing which is important not only in selling the product but in bringing the healthful attributes of the product to consumers' attention. The alternative presented in the comments of limiting the claim to not more than twice the size of the statement of identity provides for the flexibility requested to further the effectiveness of claims, while ensuring a certain proportionality of these two important pieces of information on the PDP. Therefore, the agency is revising new § 101.13(f) to require that the claim be no larger than two times the statement of identity.

2. Referral statements

6. Several comments stated that referral statements are redundant if the claim appears on the information panel with complete nutrition information. Other comments stated that these statements contribute to label clutter and cause the PDP to look like an information panel.

In response to the first group of comments, the agency points out that under proposed § 101.13(g)(2), a referral statement is not required when a claim appears on the information panel. More importantly, the requirement for a referral statement when a claim is made is statutory. Section 403(r)(2)(B) of the act specifically provides that the label contain this statement prominently and in immediate proximity to the nutrient content claim. Although the referral statement does add to the information in the PDP, this statement is necessary to ensure that consumers fully understand the nutrient content claim that is being made.

7. Several comments stated that referral statements, if required at all, should be one-half the size of the claim. Other comments stated that if a minimum type size requirement is necessary for the referral statement, FDA should specify only a minimum type size of one-sixteenth of an inch, which is the minimum type size prescribed for most mandatory information on a food label. Other comments suggested that referral statements if required at all, should be a minimum of one-sixteenth of an inch, or be of a minimum type size consistent with that required for the net quantity of contents statement in § 101.105(i) (which varies from one-sixteenth of an inch to one-quarter of an inch depending upon the area of the PDP), because this standard would assure a proportionality to the other printed material on the label.

The agency has considered these comments on the minimum type size of the referral statement. FDA agrees that it is not necessary to link the type size of the referral statement to that of the claim (as the proposal does). Such a requirement could contribute to label clutter. However, FDA does not agree that specifying only a minimum type size of one-sixteenth of an inch for the referral statement will assure adequate prominence for that statement, particularly on packages where the area of the PDP is large, and the claim is in large letters. Rather, FDA agrees that the requirements of section 403(f) and (r)(2)(b) of the act will be satisfied if the referral statement is presented in a type size consistent with the minimum type size requirements for the net quantity of contents declaration, which are linked to the area of the PDP. The proportionality between the size of the referral statement and the size of the label will ensure that the referral statement is presented with appropriate prominence.

However, FDA does not wish to inadvertently establish minimum type sizes for nutrient content claims. When the claim is less than twice what the minimum size of the referral statement would be given the size of the label and § 101.105(i), FDA believes that the type size of the referral statement may be less than that required under § 101.105 for net quantity of contents. In such circumstances, the referral statement is of appropriate prominence if it is at least one-half the size of the claim and not less than one-sixteenth of an inch. The agency believes that this approach to the type size requirement for the referral statement provides additional flexibility to firms in utilizing label space but still ensures adequate prominence for this statement.

Therefore, FDA is revising the referral statement requirement in new § 101.13(g)(1) to provide that the type

size of the referral statement be no less than that required by § 101.105(i) for net quantity of contents, except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the referral statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth of an inch.

8. Several comments requested that FDA provide that the referral statement on labels bearing a nutrient content claim become optional after 2 years. The comments argued that after 2 years, consumers will have learned that information supporting the claim is elsewhere on the label.

Section 403(r)(2)(B) of the act does not provide any authority for the agency to make such a modification to the requirement for the referral statement. Therefore, the agency rejects this request.

D. Disclosure Statements

Section 403(r)(2)(B)(ii) of the act states that if a food that bears a nutrient content claim "contains a nutrient at a level which increases to persons in the general population the risk of a disease or health-related condition which is diet related, taking into account the significance of the food in the total daily diet, the required referral statement shall also identify such nutrient," i.e., a disclosure referral statement. FDA referred to this level as the "disclosure level" in the general principles proposal (56 FR 60425). In proposed § 101.13(h), FDA defined such levels for fat, saturated fat, cholesterol, and sodium, based upon an approach that considered dietary recommendations for these nutrients, the number of servings of food in a day, and available information on food composition. The proposed provision set out the required contents of the referral statement that would result (56 FR 60421 at 60425).

9. Several comments supported the disclosure level concept. However, others expressed the view that the concept places emphasis upon a single food rather than on the total diet, with the result that a food is perceived by consumers as being "good food" or "bad food," based upon the presence or absence of a disclosure referral statement.

The disclosure statement is required under section 403(r)(2)(B)(ii) of the act, and the disclosure provision in this final rule is consistent with that requirement. However, FDA disagrees with the assertion that the presence of a disclosure statement on a food label will lead consumers to perceive that the labeled food is "bad," or that the absence of a disclosure statement on a food label will be perceived as "good." The disclosure statement specifically directs the consumer to the information panel for information about other nutrients in the food in addition to the nutrient for which disclosure is triggered, e.g., "See side panel for information about fats and other nutrients." Thus, consumers' attention will be directed to the nutrition label, and they will be able to utilize the information therein, not just the disclosure statement, as a basis for making a purchase decision about the food. The disclosure statement is not intended to serve as a primary basis for making a purchase decision. However, if a nutrient content claim is made, the label must provide the consumer with the facts that bear on the advantages asserted by the claim and with sufficient information to understand how the product fits into a total dietary regime.

10. Several comments noted that in the preamble of the general principles proposal (56 FR 60421 at 60425), the agency stated that "there are no generally recognized levels at which food components such as fat, saturated fat, cholesterol, or sodium in an individual food will pose an increased risk of disease," and that a similar statement appears in the preamble of the November 27, 1991, proposed rule entitled "Labeling; General Requirements for Health Claims for Food" (56 FR 60537 at 60543). Based on these statements, the comments reasoned, the agency would not be able to make the analysis required in section 403(r)(2)(B)(ii) of the act for including a disclosure statement in the referral statement.

The agency disagrees with the comments. Although the agency stated in the proposal that "there are no generally recognized levels at which nutrients such as fat, saturated fat, cholesterol, or sodium in an individual food will pose an increased risk of disease," and thus "if FDA were to attempt to set these (disclosure) levels on an individual food basis, it would not be possible to do so," the agency also specifically noted that the act directs the agency to take into account the significance of the food in the total daily diet when making its analysis for when a disclosure statement is required.

The analysis that the agency performed in arriving at the circumstances where a disclosure statement is required was based upon dietary guidelines, taking into account the significance of the food in the total daily diet. The analysis utilized the agency's proposed Daily Reference Value's (DRV's) for total fat, saturated fat, cholesterol, and sodium and estimates of the amounts of these nutrients in foods and the number of servings of food consumed in a day. Therefore, although the disclosure levels are applied to individual foods, the basis of their derivation is the total dietary intake of nutrients that may pose an increased risk of diet-related disease, and the difficulty in maintaining healthy dietary practice that is created if these nutrients are consumed in particular foods at levels that exceed those established as disclosure levels. Thus, the agency concludes that its statements in the proposal did not preclude it from performing this analysis, and that it performed its analysis in a manner consistent with the statute's guidance.

11. Some comments asserted that consumers should be warned if the level of certain nutrients poses an increased risk of disease, irrespective of whether a nutrient content claim is made.

The agency disagrees with these comments. Although section 403(r)(2)(B)(ii) of the act mandates that the agency require that referral statements identify particular nutrients in certain circumstances where health or nutrient claims are made, the act does not direct the agency to require the identification of such nutrients in instances where a claim is not made.

Under sections 201(n), 403(a), and 701(a) of the act, the agency could require the identification of nutrients that are present at levels that increase the risk of a disease or health-related condition in the absence of a claim. However, in the absence of a nutrient content claim, there would be no basis to conclude that consumption of the food would receive any particular emphasis as part of the total daily diet, and thus there would be no particular basis for concern, and hence for a warning, about the levels of fat, saturated fat, cholesterol, or sodium in the food. Only when the significance of the food in the total daily diet is highlighted, as it is when a nutrient content claim is made, does the level of these other nutrients become material not only for purposes of section 403(r)(2)(B)(ii) of the act but also for sections 201(n) and 403(a) of the act.

12. One comment expressed concern that the agency's establishment of disclosure levels will be an open invitation for product liability suits for all products exceeding the threshold amounts.

As stated above, the agency believes that "there are no generally recognized levels at which nutrients such as fat, saturated fat, cholesterol, or sodium in an individual food will pose an increased risk of disease." The

disclosure levels are not tied to concerns about consuming the individual food but to concerns that claims can mislead consumers about the significance of the food in the total daily diet, and that rather than facilitating compliance with dietary guidelines (see H. Rept. 101–538, 101st Cong., 2d sess. (October 1990)), such claims could make compliance with such guidelines more difficult if certain relevant information is not brought to the consumer's attention. The disclosure levels should be understood in this way. The agency wishes to make clear, however, as stated in the final rule on health claims, published elsewhere in this issue of the **Federal Register**, that foods that contain nutrients at levels that exceed the disclosure level are not unsafe, will not cause a diet related disease, and are not dangerous or "bad" foods.

13. Several comments suggested that levels other than 15 percent of the DRV should be used as the threshold level for disclosure statements. Some comments stated that a 20 percent level should be used because it is consistent with the definitions of "more" and "high" and supportable on the basis of estimates of food consumption. Another comment suggested a 7 1/2 percent level specifically for fat and saturated fat, believing that 15 percent is too high for these nutrients. Similar comments pertaining to a disqualifying level for a nutrient for a health claim in response to the November 27, 1991, proposal on "Labeling; General Requirements for Health Claims for Food," were received by the agency.

The statutory language defining a disclosure level for a nutrient in conjunction with a nutrient content claim is the same as that for a disqualifying level for the nutrient for a health claim. The agency is, therefore, adopting the same levels for the individual nutrients for both types of claims. The agency is modifying the disclosure levels in new § 101.13(h)(1) and the disqualifying levels in new § 101.14(a)(5) to 20 percent of the DRV. The rationale for increasing these levels to 20 percent of the DRV is given in the final rule on general requirements for health claims for food, which is published elsewhere in this issue of the **Federal Register**, and is incorporated herein. Therefore, the disclosure levels in new § 101.13(h) are being revised to 13.0 grams (g) of fat, 4.0 g of saturated fat, 60 mg of cholesterol and 480 mg of sodium per reference amount customarily consumed (hereinafter referred to as "reference amount"), per labeled serving size or for foods with reference amounts of 30 g or less or 2 tablespoons or less, per 50 g (for dehydrated foods that must have water added to them prior to typical consumption, the 50 g criterion applies to the "as prepared" form) (see also discussion in section III.A.1.b. of this document).

14. Several comments opposed the proposed requirement of § 101.13(h) that if a food contains more than the specified amounts of fat, saturated fat, cholesterol, or sodium per reference amount, per labeled serving size, or per 100 g, then the referral statement must include a disclosure statement. The comments stated that "per 100 g" unfairly discriminates against foods with standard serving sizes of less than 100 g, e.g., cheese, crackers, cookies, margarine, and butter. The comments further stated that the 100-g criterion makes little sense and should be eliminated.

The agency considered these comments and continues to believe that a weight-based criterion, in addition to the per reference amount and per labeled serving size criteria, is needed as a criterion for disclosure levels to ensure that if a claim is made for a food that is dense in fat, saturated fat, cholesterol, or sodium, the claim will not be misleading in light of the levels of fat, saturated fat, cholesterol, or sodium in the food. Therefore, the agency is retaining a weight-based criterion for disclosure levels in the final rule.

However, the agency agrees that the 100-g criterion is too restrictive and is modifying the criterion applied to disclosure levels in new § 101.13(h) and disqualifying levels in new § 101.14 to a weight-based criterion of 50 g that is applicable only to foods with reference amounts of 30 g or less or 2 tablespoons or less (see also discussion in section III.A.1. of this document). The rationale for this modification is fully set forth in the final rule on general requirements for health claims for food, published elsewhere in this issue of the **Federal Register** and is incorporated herein.

15. One comment contended that there is not an appropriate scientific basis for establishing a disclosure level for sodium.

The agency rejects the comment's assertion that the scientific evidence is not sufficient to support the establishment of a disclosure level for sodium. In the general requirements for health claims for food document and in the sodium/hypertension health claims document published elsewhere in this issue of the **Federal Register**, FDA responds to comments that assert that identifying sodium as a disqualifying nutrient for health claims is inappropriate and to comments that the scientific evidence relating sodium to hypertension is insufficient. Those responses are incorporated herein. The agency notes that the evidence from clinical trials supports that high sodium intake is related to high blood pressure, that the evidence from human observational studies is generally consistent and supportive, that the long-term prospective study data are sometimes inconclusive and sometimes supportive, and that there is significant scientific agreement among experts that this relationship exists. The agency concludes that the scientific basis is sufficient, and that sodium reduction is likely to benefit a significant portion of the general population.

However, as explained in the general requirements for health claims in food document published elsewhere in this issue of the **Federal Register**, in response to comments FDA is increasing the disqualifying/disclosure level to 20 percent of the DRV, as compared to 15 percent as proposed, and thus the level will be 480 mg per serving as compared with the proposed level of 360 mg.

E. Amount and Percentage of Nutrient Content Claims

In the general principles proposal (56 FR 60421 at 60426), FDA proposed to regulate the use of statements of amount (e.g., contains 2 g of fat) or that use a percentage (e.g., less than 1 percent fat) to describe the level of a nutrient in a food. The agency proposed in § 101.13(i) that foods bearing statements about the amount or percentage of a nutrient in food must meet the definition for "low" in the case of fat, saturated fat, sodium, and calories and "high" for fiber, vitamins, minerals, and other nutrients for which the term is defined.

16. Some comments expressed the view that statements regarding the amount and percentage of nutrients in food are confusing, deceptive, and misleading to most consumers and should not be permitted. One comment suggested that studies are needed to ascertain consumer perceptions in this area, and that amount or percentage labeling statements are not necessary on foods.

The agency is not persuaded that studies are needed to ascertain how these statements are understood by the consumer, or that it is necessary to ban these statements. The agency believes that statements concerning the amount and percentage of nutrients in food can provide useful information to consumers and flexibility to the food manufacturer in stating the nutritional attributes of a food. However, FDA recognizes that these statements can be

misleading. Therefore, FDA has carefully prescribed the circumstances in which such statements may be used in new § 101.13(i).

17. One comment stated that the 1990 amendments do not require FDA to limit amount or percentage statements about nutrient claims in the manner that the agency has proposed.

The 1990 amendments provide, in section 3(b)(1)(A)(iv), that FDA shall permit statements describing the amount and percentage of nutrients in food if they are not misleading, and if they are consistent with the terms defined by the agency. As discussed in the general principles proposal (56 FR 60421 at 60426), the legislative history of the 1990 amendments contemplates that the agency would define the circumstances by regulation "under which statements disclosing the amount and percentage of nutrients in food will be permitted" (136 Congressional Record, H5841–2 (July 30, 1990)). This portion of the legislative history states that "amount and percentage statements must be consistent with the terms that the Secretary has defined under section 403(r)(2)(A)(i) of the act [definition of descriptive terms] and they may not be misleading under section 403(a) in the current law." Thus, the agency believes that regulations to ensure that these statements will not be used in a misleading manner are consistent with the 1990 amendments. Therefore, the agency concludes that, consistent with the intent of the 1990 amendments, regulations controlling the use of label statements that state the amount or percentage of a nutrient in a food are appropriate.

18. Several comments suggested that amount and percentage disclosure statements should be permitted without restriction if the statement is accompanied by appropriate explanatory information, and as long as the statements are not misleading. Additionally, the comments implied that the agency should not prohibit or restrict the use of claims that convey the amount and percentage of nutrients in food because this information can direct consumers to the favorable characteristics of a food and allow consumers to compare food products within the same product line.

Other comments stated that foods should not be required to comply with such strict requirements before they can use amount and percentage statements. These comments contended that the agency has ample authority to regulate amount and percentage statements under section 403(a) of the act.

FDA finds that some restrictions on amount and percent claims are necessary. FDA advises that numerous consumer complaints, comments on a 1989 ANPRM on food labeling (54 FR 32610, August 8, 1989), and comments on the general principles and fat/cholesterol proposals about misuse of label statements such as "—— percent fat free" have persuaded the agency that, in many cases, statements regarding the amount and percentage of nutrients in food have been misleading. Moreover, section 3(b)(1)(A)(iv) of the 1990 amendments prescribes specific conditions in which such claims may be made. Therefore, FDA believes that it is necessary to limit the use of such statements in a manner that ensures that they will not mislead consumers, and that, if they implicitly characterize the level of a nutrient, they are consistent with the terms defined under section 403(r)(2)(A)(i) of the act. If amount and percentage statements are to be limited in this manner, the circumstances in which they can be used must be specifically presented. Thus, the agency concludes that, consistent with the 1990 amendments, it is necessary to limit by regulation the use of label statements that state the amount or percentage of a nutrient in a food. Therefore, as discussed in response to the next comment, the final regulation will include a provision in new § 101.13(i) limiting the use of such statements.

19. Many comments requested that FDA consider revisions in the provisions for amount and percent statements in the final rule. Some comments stated that the agency should not prohibit the use of amount and percentage statements on foods that do not meet the definition for "low" or "high" for a particular nutrient. One comment argued that, as proposed, this regulation would deprive consumers of useful information, hinder consumers from making informed food choices, and prohibit consumers from quickly differentiating between similar foods within the same product category. A similar comment suggested that FDA should permit the use of amount and percentage statements on foods where the value in the factual statement does not exceed the proposed nutrient claim disclosure level for single foods.

A few comments asserted that amount and percentage labeling statements should be permitted on foods that qualify for a "source" claim. Another comment suggested that FDA should permit the use of amount and percentage statements on foods that qualify for a "reduced" claim.

Some comments suggested that FDA should permit the use of amount and percentage statements to convey information regarding the calorie content per serving of food, consistent with the number of calories that appear on the nutrition panel. Other comments suggested that it is customary for consumers to refer to calorie information when selecting foods, and, therefore, the use of amount and percentage statements to describe this information should be permitted in the final regulation.

A few comments suggested that amount and percentage statements about the sodium content of a food provides factual information to consumers and should be permitted. Another comment stated that very few foods could convey amount and percentage statements for sodium under the proposed provisions.

These comments have convinced the agency to reconsider the proposed provisions for statements concerning the amount and percentage of nutrients in foods. The agency believes that statements relating the amount and percentage of nutrients in foods are generally useful to consumers for such purposes as pointing out the level of a nutrient in the food and facilitating comparisons between foods. The proposed provisions for amount and percentage statements would have limited the use of these statements to only foods that are "low" or "high" in the particular nutrient. FDA believes that the provisions in the proposal were too restrictive because they would deny consumers the use of such statements to evaluate many foods. FDA has considered how to permit statements of amount and percent that implicitly characterize the level of a nutrient (e.g., "less than 10 grams of fat") in a manner that benefits consumers and also satisfies the requirements of the statute. FDA believes that these conditions are met when such amount and percentage statements about a nutrient are made on foods that meet the criteria for any nutrient content claim, including relative claims, for the nutrient. Such amount and percentage statements are useful in helping consumers identify foods that facilitate conformance to current dietary guidelines. This includes foods that are a "good source of" or foods "low" or "high" in a nutrient as well as, foods that are alternatives to other reference foods (e.g., foods that are "reduced" in a nutrient.

Thus the final rule has been revised in new § 101.13(i)(1) to provide that a statement of percent and amount may be contained on the label or in the labeling of a food that meets the definition for a claim (as defined in part 101, subpart D) for the nutrient that the label addresses.

The agency also believes that a statement about the amount and percentage of nutrients that implicitly characterize the level of the nutrient can provide useful information to consumers even if the food does not meet the criteria for a claim, provided the statement does not misleadingly imply that a food contains a small or large amount of a nutrient and makes clear whether the food meets one of the nutrient content claims that the agency is defining. In circumstances in which a food does not meet the criteria for a claim, an amount or percentage statement that implicitly characterizes the level of a nutrient, appearing by itself might be misinterpreted. Thus, the statement must be accompanied by a disclaimer such as "less than 10 grams of fat, not a low fat food" or "only 200 mg of sodium per serving, not a low sodium food." The disclaimer will not only make the claim not misleading, as required by section 3(b)(1)(A)(iv) of the 1990 amendments, it will also provide the means by which the amount or percentage can be declared consistently with section 403(r)(2)(A)(i) of the act by affirmatively stating that the amount does not meet the relevant definition.

To provide for statements about the amount or percentage of a nutrient in a food that implicitly characterize the level of the nutrient under these circumstances, FDA is adding new § 101.13(i)(2) to allow for the use of amount and percentage statements when the level of the nutrient does not meet the definition for a claim if a disclaimer accompanies the claim.

This revision also includes provisions for the location and type size of the disclaimer statement that require that the disclaimer be in easily legible print or type and in a size no less than required by § 101.105(i) for net quantity of contents except where the size of the claim is less than two times the size of the net quantity of contents statement, in which case the disclaimer statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth inch. This approach has been fully discussed in response to comment 7 of this document.

Because these revisions permit the use of amount and percentage statements where a food qualifies for all relative claims, and not just "high" or "low," the agency is deleting from new § 101.13(i) the phrase that refers to these statements as implying that a food is "high or low" in a nutrient and is inserting language that states that these statements imply that the food "contains a large or small amount" of that nutrient.

In addition, based on the comments and its review of the 1990 amendments, FDA finds that there are some circumstances in which an amount claim cannot be considered to characterize in any way the level of a nutrient in a food. For example, the statement "100 calories" or "5 grams of fat" on the principal display panel of a food would be a simple statement of amount that, by itself, conveys no implied characterization of the level of the nutrient. As long as such a statement is not false or misleading, it can appropriately be included in food labeling. Therefore, FDA is providing in new § 101.13(i)(3) that an absolute statement of amount may be made without a disclaimer if "[t]he statement does not in any way implicitly characterize the level of the nutrient in the food, and it is not false, or misleading in any respect."

Finally, the agency is advising in new § 101.13(i)(4), for clarification, that amount and percentage statements made on labels or in labeling as "—— percent fat free" are not subject to the provisions of that paragraph. These statements are regulated separately under new § 101.62(b)(6). The agency believes this clarification is necessary because the preamble discussion in the general principles proposal supporting § 101.13(i) cited "—— percent fat free" as an example of a claim subject to section 3(b)(1)(A)(iv) of the 1990 amendments. While this example is appropriate, the agency is making it clear that the actual regulations governing "—— percent fat free" statements are provided in new § 101.62(b)(6) because those provisions differ from those of new § 101.13(i). The provisions for "—— percent fat free" statements are discussed below in the preamble section III.B.c.vi. [on Percent Fat Free] of this document.

F. Nutrition Labeling Required When a Nutrient Content Claim is Made

In the general principles proposal, the agency proposed (56 FR 60421 at 60426) in § 101.13(m) (redesignated as § 101.13(n) in this final rule) that a nutrient content claim may be used on the label or in labeling of a food, provided that the food bears nutrition labeling that complies with the requirements in proposed § 101.9 or, if applicable, proposed § 101.36.

20. The majority of comments addressing this issue favored the proposed requirement. One comment was concerned that requiring nutrition labeling on all foods bearing a claim will confuse consumers rather than empower them to make informed dietary selections.

The agency disagrees with the latter comment. Nutrition labeling is necessary when a claim is made to ensure that other important nutritional aspects of the food are presented along with that aspect highlighted by the claim. This fact is recognized in section 403(r)(2)(B) of the act, which requires that any nutrient content claim be accompanied by a statement referring the consumer to the nutrition label. Thus, nutrition labeling in the labeling of a food that bears a claim will assist consumers in making informed dietary selections because it provides them with additional important information about a food.

However, the Dietary Supplement Act of 1992 imposed a moratorium on the implementation of the 1990 amendments with respect to dietary supplements. Therefore, FDA is not adopting § 101.36 and has modified § 101.13(n) to reflect this fact. The agency has also added a reference to § 101.10 to cover the situation in which a nutrient content claim is made for restaurant food (see section IV. of this document).

G. Analytical Methodology

In the general principles proposal (56 FR 60421 at 60428), the agency proposed in § 101.13(n) (redesignated as new § 101.13(o) in this final rule) to determine compliance with the requirements for nutrient content claims using the analytical methodology prescribed for determining compliance with nutrition labeling in proposed § 101.9.

21. A comment expressed the view that specifying methods such as official Association of Official Analytical Chemists (AOAC International) methods for the verification of nutrient claims is a barrier to innovation. The comment suggested that FDA should specify that appropriate valid methods may be used for determining nutrient content. The comment noted that if the manufacturer uses a nonofficial method, the manufacturer should have the burden of substantiating the validity of the method that is used.

FDA notes that new § 101.9(g), as amended by the mandatory nutrition labeling document published elsewhere in this issue of the **Federal Register**, states that, unless otherwise specified, compliance with nutrition labeling will be determined using methods validated by AOAC International. That regulation also states that if no "official" analytical method is available or appropriate, other reliable and appropriate analytical procedures may be used.

An AOAC International Task Force on Nutrient Labeling Methods has

considered the adequacy of AOAC International methods to meet nutritional labeling needs. The task force judged adequacy on the basis of a survey of nutrient method users and on the basis of the collaboratively validated and officially approved status of methods in the AOAC International Official Methods of Analysis. The methods judged to be adequate relative to the regulations and to reflect current analytical definitions are listed in *The Referee* 16:7–12 (1992) (Ref. 2).

Section 101.9(g) sets out the methods that the agency will use for compliance determinations. Manufacturers may use nonofficial methods of analysis to establish nutrient content label values, but in doing so, they should ensure the validity of their methods with respect to applicability, specificity, sensitivity, accuracy, precision, and detectability. If they fail to do so, and their methods produce significantly different results than the official method, their label may subject them to regulatory action. Reliable and appropriate alternative analytical methods may be submitted to FDA for a review of their acceptability.

Thus, by referencing new § 101.9, new § 101.13(o) does not preclude a manufacturer from using alternative analytical methods for determining nutrient content label values. No amendment of the regulation is necessary to comply with the comment's suggestion.

Analytical methodology is more extensively discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the Federal Register.

H. Exemptions

This section addresses provisions in the general principles proposal for certain exemptions from the requirements for nutrient content claims: (1) Claims in a brand name; (2) "diet" soft drinks; (3) certain infant formulas; and (4) standards of identity. Other exemption provisions are addressed in the sections of this document pertaining to scope, restaurant foods, sugar free, and petitions. FDA advises that the exemption provisions proposed as § 101.13(o) have been redesignated as new § 101.13(q) in this final rule.

1. Claims in a brand name

Under section 403(r)(2)(C) of the act, manufacturers may continue to use brand names that include nutrient content claims that have not been defined by regulation, as long as those claims appeared as part of a brand name before October 25, 1989, and are not false or misleading under section 403(a). Section 403(r)(2)(B) of the act, which requires the nutrition information referral statement, does apply to foods whose brand name includes such claims. Consequently, the labeling of products whose brand name includes such terms will have to bear an appropriate referral statement.

To implement this provision of the act, the agency proposed § 101.13(o)(1) (redesignated as § 101.13(q)(1)), which states that nutrient content claims not defined by regulation, appearing as part of a brand name that was in use prior to October 25, 1989, may be used on the label or in labeling of a food, provided that they are not false or misleading under section 403(a) of the act.

22. Several comments stated that allowing some products to continue to use a nutrient content claim in a brand name while precluding others on the basis of a date (October 25, 1989) is not justified, even if it is legally sustainable. Further, some comments contended that some nonexempt products could have an equivalent or superior nutritional profile. Other comments stated that the agency should broaden the exemption to include some claims in brand names appearing after October 25, 1989, without requiring a petition or other administrative process.

The agency advises that section 403(r)(2)(C) of the act grants the agency authority to exempt only those claims in the brand names of products bearing such claims before October 25, 1989, unless the brand name contains a term defined by the Secretary under section 403(r)(2)(A)(i) or is false or misleading. While some nonexempt foods may have an equivalent or superior nutrition profile, such foods are not recognized by the statute as exempt from the section 403(r)(2)(A) of the act. Thus, the agency is obligated by the statute's language to subject nonexempt foods to the general requirements of section 403(r)(2)(A) of the act that claims contained in a brand name be defined by regulation or by an approved brand name petition submission.

23. Several comments stated that claims in brand names should be restricted to terms that have been defined by FDA, so that claims appearing before October 25, 1989, will be consistent with claims in brand names appearing after that date. The comments stated that requiring claims to be consistent will facilitate the education of the public, while allowing some claims to be exempt will create multiple meanings for the same term depending on whether it appeared on a label before or after October 25, 1989. The comments stated further that such an exemption would likely lead to nonuniformity in the marketplace and consequent consumer confusion. One of these comments stated that FDA lacked the resources necessary to provide exemptions for some products while enforcing regulations on others.

A clarification of the 1990 amendments' provisions concerning exemptions is necessary. For a claim in a brand name to remain exempt from the act's requirements, that claim would have to be, of necessity, one that has not been defined by the agency by regulation. Thus, after the effective date of section 403(r)(1)(A) of the act, that claim could not be used on food products that were not on the market before October 25, 1989. Therefore, while an undefined term may have inconsistent meanings in brand names of food products that were on the market before October 25, 1989, it will not have multiple meanings depending on whether it appeared on a food label before or after October 25, 1989, as the comment stated. Until the claim is defined, it can not be used at all on post-October 25, 1989, products or anywhere but in the brand name of pre-October 25, 1989, products. Once it is defined, it can only be used in accordance with that definition.

The agency agrees that the establishment of definitions that state clear and consistent meanings for nutrient content claims will facilitate consumer understanding of those claims. Toward this end, the agency has endeavored in this final rule to establish definitions for both expressed and implied claims that will govern as many of the types of claims that frequently appear in brand names as is possible.

However, the agency notes that because numerous types of claims appear as part of brand names, this final rule will not likely define all of the claims that may be expressed or implied as part of a brand name. The agency expects that some of these claims will continue to be used under the exemption granted in section 403(r)(2)(C) of the act. In this regard, after these regulations become effective, FDA will monitor claims used in brand names that remain exempt, and if there is evidence that use of undefined claims could result in consumer confusion or misleading labeling, the agency will consider defining terms for such claims on its own initiative.

FDA believes that defining such claims will further the statute's goal of providing consistent nutrition information on food labels and will encourage competition in the marketplace by making the terms available for products not eligible for the exemption. The agency does not

agree with the comment that stated that FDA lacks the resources necessary to enforce a regime in which some products are subject to exemptions while others are not. The agency does not expect a significant added burden to be placed upon its resources if some claims in a brand name remain exempt, since exempt status does not flow from agency action or approval but is granted by the statute if the claim appeared in a brand name of a food product before October 25, 1989.

24. Some of the comments requested that FDA either define terms that are implied nutrient content claims used in brand names by regulation, to provide for their use under section 403(r)(2)(A) of the act, or regulate their use on a case by case basis under the general misbranding provisions of the act.

The agency agrees in principle with this comment's suggestion that it should define terms used as part of a brand name that may express or imply a nutrient content claim. As noted in the response to the previous comment, the agency has endeavored in this final rule to establish definitions for both expressed and implied claims that will permit, to the extent feasible at this time, as many as possible of the types of claims that frequently appear in brand names.

However, as also noted above, the provisions in this final rule will not likely define all claims made as part of a brand name. With regard to any claim not defined by the agency, the alternatives provided by the statute are that either the claim is exempt, or it must be the subject of a brand name petition that is granted by the agency. There is no provision in the statute for nondefined terms used in claims to be evaluated under the broad misbranding provisions of the act, other than that which states that exempt claims in brand names (i.e., claims that are contained in the brand name of a specific food product that was the brand name in use on such food before October 25, 1989; see discussion in comment 25 of this document) must not be misleading under section 403(a) of the act. Therefore the agency rejects the suggestion that it either define all the terms or regulate their use on a case by case basis under the provisions of the act that prohibit false or misleading labeling.

25. Several comments stated that proposed § 101.13(o)(1) should be revised to clearly state that the exemption applies only to terms used in brand names used on specific and discrete food products before October 25, 1989, and not to products introduced after that date. These comments stated that the statutory exemption in section 403(r)(2)(C) of the act is triggered on a product-by-product basis, i.e., "such brand name" must have been in use on "such food" before October 25, 1989, for the exemption to apply. Some of these comments stated that an across-the-board exemption to a particular brand name would give an unfair competitive advantage to manufacturers who happened, before October 25, 1989, to have used an expressed or implied nutrient content claim in a brand name.

Other comments disagreed, arguing that product line extensions of qualifying brand names should also be exempted from the requirements for nutrient content claims because it would be unfair to exclude new products from bearing the same claim in the brand name until a petition for the use of the claim in the brand name is approved. Some comments stated that the 1990 amendments are ambiguous regarding whether the exemption provision for brand names applies to specific products bearing the brand name or to the brand name itself. These comments stated that this provision should be interpreted broadly because: (1) Laws afford special protection from government interference to trademark brand names; (2) a broad interpretation would be in accordance with Executive Order 12630, which directs that agency actions for the protection of public health and safety should be designed to advance significantly the health and safety purpose and be no greater in scope than is necessary to achieve that purpose and (3) a broad interpretation would be consistent with the President's "Memorandum For Certain Department and Agency Heads" on reducing the burden of government regulation (Ref. 3).

The agency does not believe the 1990 amendments are ambiguous on this issue because the statutory language, specifically the requirement that "* * * such brand name was in use on such food," limits the scope of the exemption to specific foods bearing the claim in the brand name. Thus, the agency does not agree with the comments that asserted that the agency should apply the exemption to line extension products.

The agency agrees with the comment that the final rule should be revised to clarify the scope of the exemption for brand names, and therefore it is revising the first sentence of new § 101.13(q)(1) to read:

Nutrient content claims that have not been defined by regulation and that are contained in the brand name of a specific food product that was the brand name in use on such food before October 25, 1989, may continue to be used as part of that brand name for such product, provided that they are not false or misleading under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act).

26. One comment requested clarification as to whether the exemption for claims in brand names in use before October 25, 1989, applies to the type size of the claim on the label as well as to the claim itself. Several comments stated that referral statements should not be required for claims that are made as part of a brand name. Several comments stated that brand name claims should be required to bear referral statements, particularly if accompanied by a claim that uses a defined term.

Section 403(r)(2)(C) of the act exempts certain claims contained in a brand name from the requirements of section 403(r)(2)(A). This exemption covers all the requirements in section 403(r)(2)(A) of the act , including the disclosure requirements in section 403(r)(2)(A)(iii) through (r)(2)(A)(iv) as well as the accompanying type size requirements. Claims in brand names are not exempted however from section 403(r)(2)(B) or (f). Therefore, such claims are not exempt from the type size requirement in new § 101.13(f) or from the referral statement requirements in new § 101.13(g) and (h). FDA is adding a sentence to new § 101.13(q)(1) to make this clear.

27. Several comments requested that FDA adopt a policy whereby enforcement action will not be taken against products bearing an expressed or implied claim in a brand name that is the subject of a petition until the agency has ruled on the use of the claim.

The agency disagrees with these comments. The statute establishes a petition process for new nutrient content claims, including use of an implied claim in a brand name. See section 403(r)(4)(A) of the act. The latter type of petition is deemed to be granted if the agency does not act on it in 100 days (section 403(r)(4)(A)(iii) of the act). It would make little sense for Congress to have included a petition process with such tight timeframes if it intended that a claim could appear while the petition for such claim is under agency review. Therefore, the agency denies this request.

28. Several comments stated that no nutrient content claim used before October 25, 1989, in a brand name should be permitted regardless of whether or not it has been defined, but provided no supporting rationale for this position.

Because these comments are inconsistent with section 403(r)(2)(C) of

the act, and in the absence of any information to support the position they advance, FDA is rejecting them.

29. Several comments stated that the agency should allow the use of undefined claims in a brand name that were not in use before October 25, 1989 if the claim is accompanied by clarifying information.

The agency disagrees with these comments. The course of action advocated by these comments would nullify the explicit provisions of the statute that require that any claim in a brand name that is not exempt under section 403(r)(2)(C) of the act be used only in accordance with a definition established by the agency, or after the agency has granted a petition for the claim (section 403(r)(1)(A) and (r)(2)(A)). While such information may cure a misbranding under section 403(a) of the act, it would not be consistent with section 403(r). Therefore the agency denies the comment's request that it allow the use of undefined nonexempt claims in a brand name if accompanied by qualifying information.

2. "Diet" soft drinks

Section 403(r)(2)(D) of the act exempts use of the term "diet" on soft drinks from the requirement that a term may be used only in accordance with the definitions established by FDA, provided that its use meets certain conditions: (1) The claim must be contained in the brand name of such soft drink; (2) the brand name must have been in use on the soft drink before October 25, 1989; and (3) the use of the term "diet" must have been in conformity with § 105.66. In accordance with these conditions, the agency proposed in § 101.13(o)(2) that if the claim of "diet" was used in the brand name of a soft drink before October 25, 1989, in compliance with the existing § 105.66, the claim may continue to be used. Any other uses of the term "diet" must be in compliance with amended § 105.66.

30. Several comments requested clarification that the exemption for a claim that uses the term "diet" in the brand name of a soft drink does not preclude line extensions, e.g., new flavors for the brand after October 25, 1989.

For the reason discussed in comment 25 of this document, the statutory exemption for claims using the term "diet" in the brand name of a soft drink does not extend beyond discrete products that were available before October 25, 1989. However, the agency is continuing to define the term "diet" in its regulations, specifically in § 105.66, as discussed in the general principles proposal (56 FR 60421 at 60457). Thus, if the use of the term "diet" in the brand name of a soft drink is in conformity with § 105.66, it may be used on a soft drink product whether or not that product was available before October 25, 1989. The agency is unaware of any instances whereby line extensions for "diet" soft drinks would not be in conformity with § 105.66, and no such instances were presented in the comments. For clarity, the agency is specifying in new § 101.13(q)(2) that soft drinks marked after October 25, 1989, may use the word "diet" provided they are in compliance with current § 105.66.

31. Several comments requested clarification that claims that use the term "diet" in the brand name of a soft drink are exempt from the requirement in section 403(r)(2)(B) of the act that nutrient content claims be accompanied by the referral statement. These comments further stated that the exemption applies to all of the requirements imposed by section 403(r)(2) of the act.

The agency agrees with the comments that section 403(r)(2)(D) of the act exempts a soft drink bearing the term "diet" as part of the brand name from all provisions of section 403(r)(2), including the requirement that a referral statement accompany the claim.

3. Infant formulas and medical foods

Section 403(r)(5)(A) of the act states that section 403(r) does not apply to infant formulas subject to section 412(h) of the act or to medical foods as defined in section 5(b) of the Orphan Drug Act (21 U.S.C. 360ee(b)). Section 412(h) of the act applies to any infant formula that is represented and labeled for use by an infant who has an inborn error of metabolism or a low birth weight or who otherwise has an unusual medical or dietary problem. Section 5(b)(3) of the Orphan Drug Act defines the term "medical food" as a food that is formulated to be consumed or administered enterally under the supervision of a physician and that is intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation. FDA presented its views on what constitutes a medical food in its supplementary proposal on mandatory nutrition labeling (56 FR 60366 at 60377). Accordingly, the agency proposed in § 101.13(o)(4) to reflect these provisions of the act.

32. Several comments pointed to the fact that the agency already permits, under § 107.10(b)(4) (21 CFR 107.10(b)(4)) which was issued under authority of sections 412 and 403 of the act, the labels of certain infant formula products to bear statements such as "with added iron" (see 56 FR 60366 at 60378). These comments requested that the agency revise proposed § 101.13(o)(4) to state explicitly that claims permitted by part 107 (21 CFR part 107) can continue to be made without respect to the requirements of part 101 for infant formulas for normal full term infants, as long as the claims comply with the requirements of part 107. One comment stated that the infant formula regulations ensure FDA oversight for these foods, making additional restrictions unnecessary. These comments stated that such a revision would make it clear that claims permitted under part 107 are not subject to the regulations established under the 1990 amendments.

Under section 403(r)(5)(A) of the act, section 403(r) applies to all infant formulas except infant formula that are exempt under section 412(h) of the act. Under section 403(r)(2)(A)(i) of the act, a claim that characterizes the level of a nutrient in a food may be made only if it uses terms that are defined by regulation by the Secretary (and FDA, by delegation). Thus, while the terms used on infant formula are subject to a nutrient content claims regime, claims made on infant formula in accordance with part 107 are in compliance with that regime because they use terms defined in the regulations of the agency. To reflect this fact, FDA has added references to part 107 in new § 101.13(b) and (b)(3).

33. One comment requested that nutrition information in the form of publications and promotional materials provided to pediatricians concerning infant formula products for normal full-term infants be exempt from the labeling requirements of this final rule.

The agency advises that to the extent that nutrition information in any form, including publications and promotional materials of the type described, is labeling, it must comply with all applicable requirements of the act and their implementing regulations in this final rule. Further, FDA does not have authority to exempt any food labels or labeling from the requirements of the act. Labeling on infant formula products for normal full-term infants is not exempted by the 1990 amendments from the act's requirements for nutrient content claims. Therefore, the labeling for these foods must comply with the requirements in this final rule.

4. Standards of identity

Section 403(r)(5)(C) of the act states that nutrient content claims that are

made with respect to a food because the claim is required by a standard of identity issued under section 401 of the act (21 U.S.C. 341) shall not be subject to section 403(r)(2)(A)(i) or (r)(2)(B). Thus, a nutrient content claim that is part of the common or usual name of a standardized food may continue to be used even if the use of the term in the standardized name is not consistent with the definition for the term that FDA adopts, or if FDA has not defined the term. Moreover, the label of the standardized food would not need to bear a statement referring consumers to the nutrition label. However, in the general principles proposal (56 FR 60421 at 60429), FDA reviewed the legislative history of this provision, which makes clear that Congress did not intend section 403(r)(5)(C) of the act to imply, in any way, that new standards issued under the act would be exempt from the provisions for nutrient content claims in part 101. Rather, Congress intended that this exemption would apply only to nutrient content claims made in the names of existing standards of identity (see H. Rept. 101–538, 101st Cong., 2d sess. 22 (1990)).

Accordingly, the agency proposed in § 101.13(o)(6) that nutrient content claims that are part of the name of a food that was subject to a standard of identity on November 8, 1990, the date of enactment of the 1990 amendments, are not subject to the requirements of proposed § 101.13(b),(g), and (h) or to the definitions of part 101, subpart D.

34. Several comments disagreed that nutrient content claims that are part of the common or usual name of a food that was subject to a standard of identity on November 8, 1990, should be exempt from having to comply with the definitions for such claims established by the agency. These comments stated that consumers may be confused by inconsistent meanings of the same term in standardized versus nonstandardized foods because many consumers do not know the difference between standardized and nonstandardized foods. Additionally, these comments stated that it was unfair to exempt standardized foods from the general requirements for nutrient content claims.

Section 403(r)(5)(C) of the act specifically exempts nutrient content claims that were part of the common or usual name of a food subject to a standard of identity on November 8, 1990, from the requirement that terms used to make claims comply with definitions established by regulation. Because this exemption is statutory, the agency must make it available to foods that meet the criteria for the exemption. Therefore FDA is retaining new § 101.13(q)(6) as proposed. The agency more fully discusses this exemption in the document addressing labeling requirements for foods named by use of a nutrient content claim and a standardized term published elsewhere in this issue of the **Federal Register**.

5. Other

35. The agency determined in the final regulation on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**, that bottled water is not exempt from nutrition labeling unless it contains insignificant amounts of nutrients. Similarly, label statements on bottled water that make claims about nutrients of the type required to be declared in nutrition labeling are nutrient content claims requiring definition under section 403(r) of the act. In this regard, the proposal asked for comment as to how to decide what constitutes a nutrient content claim (56 FR 60421 at 60424). Comments on this issue have led FDA to conclude that fluoride is a special nutrient that warrants different labeling requirements than other nutrients.

Many public drinking water systems add fluoride to drinking water to help reduce dental caries. In addition, the Surgeon General has supported this practice (Ref. 4). However, there are concerns that fluoride levels in drinking water not be too high. The Environmental Protection Agency has established primary and secondary drinking water standards for fluoride (51 FR 11396, April 2, 1986) and FDA has proposed to revise its quality standard for fluoride in bottled water accordingly (53 FR 36036, September 16, 1988). Therefore, FDA believes that while the presence of fluoride in bottled water is of interest to consumers and its declaration should not be prohibited, the agency does not wish to encourage unnecessary addition of fluoride to bottled water. The agency is concerned that if terms like "good source of fluoride" or "high in fluoride" were permitted, they might encourage such additions.

Consequently, the agency has not defined a nutrient content claim for fluoride. Instead, it has provided that a statement indicating the presence of added fluoride may be used, but the claim may not include a description of the level of fluoride present. FDA has provided in new § 101.13(q)(8) that bottled water containing added fluoride may state that fact on the label or in labeling using the term "fluoridated," "fluoride added," or "with added fluoride."

III. Definition of Terms

A. General Approach

1. Criteria for definitions of terms

a. Serving size to evaluate nutrient content claims

In a proposal addressing food labeling and serving sizes that was published in the **Federal Register** on November 27, 1991 (56 FR 60394), FDA proposed among other things to: (1) Define serving and portion size on the basis of the amount of food customarily consumed per eating occasion, (2) establish reference amounts (reference amounts customarily consumed) per eating occasion for 131 food product categories, and (3) provide criteria for determining labeled serving sizes from reference amounts. In § 101.12(g), FDA proposed that if the serving size declared on the product label differs from the reference amount listed in proposed § 101.12(b), then both the reference amount and the serving size declared on the product label are to be used in determining whether the product meets the criteria for a nutrient content claim.

The agency also discussed this requirement in the general principles proposal (56 FR 60421 at 60430), stating that it believed it would be misleading to make a claim on a product that met the criteria for a claim on a reference amount basis but that did not qualify for the claim on the basis of the labeled serving size, i.e., the entire container. The agency noted, however, that this approach created situations in which a product in one size container would be eligible to bear a claim, while the same product in a different size container would not be eligible. In the serving size proposal (56 FR 60394 at 60413), FDA discussed another approach to eligibility for a claim based solely on the reference amount plus a disclaimer on the label and solicited comments on both options.

36. Most comments addressing this issue, including several industry comments, supported FDA's proposal for basing claims on both the reference amount and the labeled serving size. However, several comments from industry, trade associations, and a few professionals objected to requiring both the reference amount and the labeled serving size. These comments stated that claim evaluations should be based solely on the reference amount. The comments argued that claims should reflect true characteristics of the product, and that a product that qualifies for the claim should be able to bear the claim on all container sizes. They argued that inconsistency from

container to container in the use of claims on the same product in different sized containers would be confusing to consumers.

These comments and FDA's responses are fully discussed in the final rule on serving sizes, elsewhere in this issue of the Federal Register. As explained in that document, the agency has been persuaded to reconsider its proposal and has concluded in that final rule to base eligibility for a claim solely on the reference amount and to require a disclaimer when the amount of the nutrient contained in the labeled serving size does not meet the maximum or minimum amount criterion in the definition for the nutrient content claim for that nutrient. The disclaimer that follows the claim will inform consumers of the basis on which the product qualifies for the claim. Therefore, the possibility of misleading the consumer is reduced. The agency believes that this approach resolves the objections raised in the comments. Further, under this approach the claim would reflect true characteristics of the product, not the container size, and may be less confusing to consumers.

Accordingly, in the final rule FDA is revising all of the provisions for specific nutrient content claims that, as proposed, would have required foods bearing claims to meet both a per reference amount criterion and a per labeled serving size criterion. These sections, as revised, now require that the food only meet a per reference amount criterion.

FDA is also codifying the requirements for the disclaimer in the final rule in new § 101.13(p). New § 101.13(p)(1) states:

> The reference amount set forth in § 101.12(b) through (f) shall be used in determining whether a product meets the criteria for a nutrient content claim. If the serving size declared on the product label differs from the reference amount, and the amount of the nutrient contained in the label serving size does not meet the maximum or minimum amount criterion in the definition for the descriptor for that nutrient, the claim shall be followed by the criteria for the claim as required by § 101.12(g) (e.g., "very low sodium, 35 mg or less per 240 mL (8 fl oz)").

Further, new § 101.13(p)(2) provides that the criteria for the claim must appear immediately adjacent to the most prominent claim in easily legible print or type and in a size no less than that required by § 101.15(i) for net quantity of contents except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the disclaimer statement should be no less than one-half the size of the claim but not smaller than one-sixteenth inch. This provision ensures that the disclaimer will have appropriate placement on the label and that its prominence will be consistent with other required supporting statements (e.g., referral statements).

b. Criterion based on a designated weight

In the general principles and fat/cholesterol proposals, FDA proposed in §§ 101.60, 101.61, and 101.62 that the definition of certain terms (e.g., "low" for calories, fat, sodium, and cholesterol and "very low" for sodium) be based on the following criteria: (1) The amount of nutrient per reference amount (reference amount), (2) the amount of nutrient per labeled serving size, and (3) the amount of nutrient per 100 g of food. The weight-based criterion (i.e., per 100 g of food) required that the maximum amount of the nutrient allowed per serving also be the maximum amount of the nutrient contained in 100 g of the food (e.g., for "low fat," 3 g or less of fat per serving and 3 g or less of fat per 100 g).

In the general principles proposal (56 FR 60421 at 60430), FDA stated that without the weight-based criterion, "low" claims would be allowed on certain foods that are dense in a nutrient on a weight basis yet still qualify for a "low" claim because of their small serving size. For example, without the weight-based criterion, butter and some margarines could make "low sodium" claims, although they contain as much as 900 mg sodium per 100 g of food. In addition to stating the misleading nature of such claims, FDA expressed concern that nutrient dense foods with small serving sizes may be consumed frequently throughout the day and ultimately make substantial contributions to the diet despite their "low" claims. Thus, FDA proposed the weight-based criterion to prevent misleading "low" claims on certain nutrient dense foods. FDA further stated that such claims may be counterproductive relative to educating consumers about the nutrient quality of foods.

37. Many comments requested that the agency delete the weight-based criterion from the final rule. The comments cited various reasons for this request. One of these comments stated that the weight-based criterion would eliminate important foods from the diet of persons advised by medical personnel to "watch" a particular nutrient and suggested that such persons might not eat particular foods if such foods were not labeled as "low" in that nutrient. The comment maintained that foods that do not meet the agency's proposed criteria for "low" can still be included in a healthy diet.

The agency realizes that some foods that do not meet its criteria for "low" can be included in a diet that meets current guidelines. The agency notes that the proposed definition of "low" is designed to allow a consumer to meet current dietary recommendations while selecting a variety of foods, including some that are "low" in a nutrient such as fat, and some that are not "low." Thus, FDA disagrees with the essential point of this comment, that it should not include a weight-based criterion for "low" claims because some foods that do not meet the criteria for "low" can be included in a diet that meets current guidelines. The agency believes that a weight-based criterion is a necessary criterion for the definition of "low" to prevent misleading claims on certain nutrient dense foods.

38. Some comments argued that the need for the criterion was eliminated or diminished by FDA regulations that would require serving sizes to reflect amounts customarily consumed and would require the listing of both serving size and nutrient content on the nutrition label. One of these comments further stated that if there were still problems with certain nutrient dense foods qualifying for "low" claims, then the reference amount might be adjusted to solve these problems.

FDA considered the comments suggesting that the weight-based criterion could be deleted because serving sizes will be based on amounts customarily consumed. However, the agency rejects this suggestion because basing eligibility for a claim on serving size alone would mean that certain foods with small serving sizes that have a substantial amount of a particular nutrient on a per weight basis could make "low" claims. For example, the agency conducted an analysis to assess the effect of deleting the weight-based criterion using food composition data of USDA (Ref. 5) in conjunction with the reference amounts in FDA's final rule on serving sizes. The analysis showed that without a weight-based criterion, products such as sugar, grated parmesan cheese, and 25 percent fat cream could be labeled as "low calorie;" evaporated whole milk, nondairy creamer, green and ripe olives, and whipped dessert toppings as "low fat;" salted peanuts, butter, margarine, mayonnaise, ripe olives and mustard as "low sodium;" and grated parmesan cheese and regular mayonnaise as "low cholesterol" (Ref. 6). "Low" claims on these foods are contrary to recommendations made in the "Nutrition and Your Health: Dietary

Guidelines for Americans," issued jointly by the U.S. Department of Health and Human Services and USDA (Ref. 7) and would mislead and confuse the consumer.

Furthermore, "low" claims may promote increased consumption of such foods and thus, result in dietary practices even more inconsistent with dietary guidelines. For example, "low calorie" claims could appear on the labels of granulated sugar and brown sugar, although the guidelines state that sugars and the many foods that contain them in large amounts should be used in moderation by most healthy people and used sparingly by people with low calorie needs. A "low fat" claim could be made on evaporated whole milk, although the guidelines promote the consumption of skim or low fat milk to help obtain a diet low in fat. In addition, "low sodium" claims could be made on ripe olives, mayonnaise, and mustard, although the guidelines identify olives, salad dressing, and condiments such as mustard as foods that contain considerable amount of sodium. Further, "low sodium" claims could be made on some salted snacks, although the guidelines recommend that salted snacks be consumed sparingly. Consumer confidence in the validity of nutrient content claims would likely be undermined by "low" claims on foods that are clearly not "low" in certain nutrients but could make a claim because the established serving size is so small. For these reasons, FDA has concluded that the weight-based criterion should not be eliminated.

Furthermore, the agency rejects the suggestion made in one comment to adjust reference amounts (serving size) to prevent claims on nutrient dense foods. The agency does not have the authority to do so. Section 403(q)(1)(A)(i) of the act states that the serving size is an amount that is customarily consumed. Therefore, FDA concludes that a weight-based criterion is the best way to address the problem that it has identified.

39. Several comments stated that the weight-based criterion should be deleted because: (1) The 100 g amount is not based on amounts of foods customarily consumed; (2) consumers do not make food choices based on 100 g of food; (3) some foods now labeled as "low sodium" may no longer be permitted to use that term; and (4) not all food products with similar amounts of a nutrient per serving would be permitted to bear "low" claims.

As discussed in the general principles proposal (56 FR 60421), the 100-g criterion is a criterion that reflects nutrient density. As such, it is not intended to reflect an amount of food customarily consumed. FDA finds no reason to conclude that this criterion will confuse consumers because it is not disclosed to the consumer. Additionally, the agency is not persuaded that consumers will be confused if some products currently using terms such as "low sodium" no longer qualify because of the additional criterion. Rather, the agency believes that consumers expect changes in claims on products to result from the implementation of the 1990 amendments.

Further, FDA does not believe that consumers will be confused if all food products with similar amounts of nutrients per serving did not bear "low" claims because consumers will likely recognize certain foods as being nutrient dense and others as not being nutrient dense. On the contrary, consumer confusion is likely to result if "low" claims appear on foods that are generally known to contain considerable amounts of the subject nutrient on a weight basis.

40. Several comments opposed to the weight-based criterion also disagreed with the statement in the general principles proposal (56 FR 60421 at 60431) that some nutrient dense foods with small serving sizes may be consumed frequently throughout the day. These comments said there was no evidence that these foods are overconsumed, nor was there evidence that they are consumed more than food products with larger serving sizes. A few of these comments stated that consumer education efforts could address any problems with these foods including their possible overconsumption.

FDA has reconsidered whether nutrient dense foods with small serving sizes will be frequently consumed, and the importance of this issue in justifying a weight-based criterion. The agency acknowledges the difficulty in providing persuasive evidence that many nutrient dense products may be frequently consumed, in part because of certain limitations in the available food consumption estimates. However, the agency believes that "low" claims on certain nutrient dense foods with small serving sizes, such as those cited in comment 38 of this document, may promote increased consumption of these foods, and when considered in the context of the total diet, such consumption would be inconsistent with current dietary recommendations. Therefore, the agency believes that "low" claims on these foods will be misleading to consumers.

Further, it would be inappropriate for the agency to use consumer education to promote the acceptance of labeling claims that it regards as misleading because such an approach would undermine the provision of the act that directs the agency to establish regulations to prevent false and misleading label declarations. Therefore, the agency rejects the suggestion that it abandon the weight-based criterion in favor of efforts to educate consumers about "low" claims for nutrient dense foods.

41. Other comments opposed to the proposed weight-based criterion asserted that it will act as a disincentive to manufacturers to produce healthier food products if they could not use claims such as "low" on the label. One of these comments said that manufacturers will have difficulty reformulating some products to meet the weight-based criterion, while another said that the inability to advertise a healthier product could lead to a manufacturer's shifting the emphasis from reducing fat or salt to adding fat or salt for better taste.

FDA examined the extent to which a weight-based criterion would be a disincentive to manufacturers to produce healthier products. The agency acknowledges that an overly restrictive weight-based criterion would limit the number of products that could be reformulated to qualify for "low" claims. However, the agency disagrees that manufacturers are likely to resort to adding fat or salt if they are unable to make "low" claims, because the manufacturer would still have available comparative claims such as "less" to publicize nutritional improvements in products. Therefore, FDA rejects these comments.

42. Several comments were opposed to the weight-based criterion because of the number and type of food products that would be precluded from bearing claims by this criterion. Some of the food products cited by the comments included certain dry food products (e.g., dry hot cereals and dehydrated soups); some types of bread, pasta, crackers, and other cereal grain products; snack products and cookies; lower fat cheeses and other dairy products; lower fat salad dressings; spice blends and seasoning blends; and sauces, margarine, butter, and oils. One comment said that it would make it almost impossible for products whose reference amount was less than 100 g to qualify for certain nutrient content claims, while other comments said that the criterion discriminates against food with small serving sizes and nutrient-dense foods. Other comments said that this criterion

diminished the distinction between the terms "low" and "free" and was unfair to low moisture foods.

FDA considered the comments that said that the weight-based criterion should be deleted because of the number and types of food products that would be precluded from bearing claims. The agency disagrees with the comment that the proposed criterion would make it almost impossible for products with a reference amount of less than 100 g to qualify for certain content claims. Many products with reference amounts under 100 g would qualify for "low" claims under FDA's proposed criterion (e.g., many vegetable products, dried fruit, legumes, some gravies and sauces, some fish products, several cereal grain and pasta products, and a number of breakfast cereals could make "low fat" claims) (Ref. 8).

FDA also considered the comments that said that the proposed weight-based criterion discriminates against foods with small serving sizes and nutrient dense foods, but concluded that a weight-based criterion is needed to prevent nutrient dense foods with small serving sizes from making misleading claims. Further, the agency disagrees that the revised weight-based criterion would diminish the distinction between "low" and "free" claims. The agency has provided clearly distinctive definitions for these two nutrient content claims.

43. At least two comments suggested alternative criteria that would incorporate the frequency of consumption of a food. One comment suggested that nutrient dense foods with small serving sizes should be prevented from making "low" claims only if they are consumed many times during the day. Another comment proposed that foods be required to meet the criteria for "low" claims based both on levels per reference amount and per total daily intake (i.e., reference amount times average number of servings per consumer per day). The daily number of servings would be derived from national food consumption surveys. This comment acknowledged that a major disadvantage to this approach would be the complexity of determining the figures.

The agency agrees that an approach that considers frequency of consumption would be complex. FDA rejects this approach principally because it does not adequately address the agency's concerns with regard to nutrient dense foods with small serving sizes. The agency believes that the suggested approach would not effectively control misleading claims on nutrient dense foods with small serving sizes because it does not provide any means of dealing with the likely effect of the appearance of the claim on the food. In other words, it would make little sense for the agency to allow a claim based on current consumption levels, but then to move to withdraw the authorization for the claim as soon as new consumption information appears showing that there is increased consumption of the food in response to the claim, and that consumption is inconsistent with dietary guidelines. A weight-based criterion will ensure that increased consumption of the food will still be consistent with dietary guidelines.

44. One comment suggested, as an alternative to the weight-based criterion, that food products that may have significantly different serving sizes because of different uses be required to meet the "low" level based on all of the respective reference amounts. The comment stated that one-third of all nondairy creamers are consumed with cereal in place of milk, and thus the reference amount used as a basis for claims should reflect this use. This comment also suggested as an alternative to the weight-based criterion that food products that have small serving sizes be required to meet a lower nutrient level per serving to make a claim. For example, for foods with a one ounce reference amount or less, fat content could not exceed 2 g per reference amount.

The agency rejects these suggestions because the first has only limited application, and the second is not an effective alternative in preventing misleading claims. With regard to the first suggestion, most nutrient dense foods with small serving sizes (e.g., butter) would be subject to only one reference amount. The second suggested alternative would not prevent "low fat" claims on foods such as grated parmesan cheese and whipped dessert toppings (Ref. 9), and, as discussed in comment 38 of this document, such claims would be misleading.

45. Some comments suggested applying a weight-based criterion only to foods with small serving sizes. One comment suggested that the agency develop a provision to cover foods that weigh 40 g or less per serving and contain more than 5 calories per g. Another comment suggested that the proposed weight-based criterion only be applied to foods with reference amounts 15 g or less or 2 tablespoons or less and that are consumed frequently throughout the day. Other comments suggested that certain nutrient content claims be prohibited on specific categories of foods with very small serving sizes or prohibited on foods with less than a minimum serving size that contained more than a certain amount of fat on a dry weight basis. One comment suggested that a minimal serving size for specific nutrient content claims be established such as one tablespoon.

The agency has carefully considered the suggestions raised in the comments that a weight-based criterion apply only to foods with small serving sizes. Because the intent of the agency is to prevent misleading claims on nutrient dense foods that have small serving sizes, the agency has concluded that narrowing the scope of the provision such that it only applies to foods with small serving sizes adequately addresses its concern of misleading claims on nutrient dense foods with small servings. Moreover, the agency has concluded that with appropriate provisions applicable only to foods with small serving sizes, misleading claims on nutrient dense foods can be prevented. However, the alternatives suggested in the comments were not the most effective options in preventing such claims. For example, with the first alternative suggested by the comments, green olives with about 13 g of fat per 100 g could qualify as "low fat" and 25 percent fat cream with about 240 calories per 100 g as "low calorie" (Ref. 10). With the second suggested alternative, salted peanuts with about 430 mg sodium per 100 g could qualify as "low sodium" (Ref. 10).

The agency considered, however, that if the second suggested alternative was modified to apply to foods with reference amounts of 30 g or less or 2 tablespoon or less, and the concept of frequency of consumption was deleted, then the proposed weight-based criterion applied to such foods would prevent inappropriate claims (Ref. 6). In addition, this criterion would permit more foods that are promoted in dietary guidelines to make "low" claims than FDA's proposed criterion. For example, breads and pastas that qualified on a per serving basis could make "low" claims. Accordingly, in the final rule, the agency is including a weight-based criterion for "low" claims only for those foods that have reference amounts of 30 g or less or 2 tablespoons or less. As discussed below, in comment 48 of this document, the agency is also persuaded to adopt a less restrictive weight-based criterion.

46. At least two comments suggested as an alternative that foods with small serving sizes be required to have a qualifying statement such as "low fat per one tablespoon" or "low fat when consumed in a 1-ounce serving." One

comment suggested that this qualifying statement only be required for foods that exceeded FDA's proposed per 100-g criterion. These comments said that the disclosure would alert people to the possibility that the product would no longer be "low fat" if a larger serving were consumed and would educate consumers who did not know that nutrient content claims are dependent on serving sizes.

This alternative would permit claims on all foods meeting the per serving criterion and would provide additional clarification of the claim to the consumer. However, the agency is not persuaded to adopt this alternative because the agency believes that even with the additional disclosure, such claims may confuse the consumer if the food product contains considerable amounts of the nutrient on a weight basis.

47. A few comments suggested as an alternative that all food products that meet the per serving criterion for a claim also be required to meet a caloric density criterion. Reasons cited in support of a caloric density criterion were that it would prevent nutrient dense foods with small serving sizes from making misleading claims, would allow products of widely differing serving sizes and calorie levels to be assessed fairly, and would eliminate inequities of the proposed 100-g criterion that favored hydrated products. One comment recommended that "low fat" foods not contain more than 15 g of fat per 100 g on a dry weight basis, which is equivalent to about 30 percent of calories from fat. Another comment recommended that instead of a weight-based criterion, a criterion of less than 45 percent of calories from fat should be applied to the "low fat" definition.

Disadvantages to a caloric density approach were also cited in comments. They included the potential for: (1) Manufacturer misuse such as increasing the fat/calorie content of a product to obtain a lower level of a particular nutrient (e.g., a lower sodium or cholesterol level) on a per calorie basis, and (2) manufacturer disincentive to produce "lower calorie" foods because, with the caloric density approach, the levels of problem nutrients would be higher compared to the higher calorie version of the product.

Other comments suggested that a weight-based criterion be based on nutrient levels per 100 calories or nutrient levels per 117.5 calories. The latter caloric level was derived by dividing the agency's proposed reference daily caloric intake of 2,350 calories by the agency's estimate of 20 servings of food being consumed in a day. The comment stated that this caloric level would be tied to average daily consumption, whereas 100 g has no relation to daily food consumption.

The agency has considered the appropriateness of applying a caloric density criterion for "low" claims for fat, cholesterol, and sodium. The agency acknowledges that it proposed this type of approach for a weight-based criterion for saturated fat in order to provide "low" claims for saturated fat on certain fats and oils (e.g., canola oil) because all fats and oils would exceed a weight-based criterion based on 100 g.

The agency is concerned, however, that the caloric density approach would permit misleading "low" claims for cholesterol and sodium. For example, if the criterion was that a food could have no more than proposed nutrient levels per 117.5 calories, then butter with about 800 mg of sodium per 100 g could qualify for a "low sodium" claim and grated parmesan cheese with about 80 mg of cholesterol per 100 g for a "low cholesterol" claim (Ref. 11). The agency also agrees with comments that the caloric density approach could encourage the development of higher fat, higher calorie products in order to make "low sodium" and "low cholesterol" claims. Thus, this approach would be inconsistent with national dietary goals of lowering fat intake (Refs. 4, 7, and 12).

The agency also considered whether this type of criterion might be applied to fat but not to sodium and cholesterol. However, if a criterion such as less than 30 percent calories from fat were used, then low calorie, high moisture products such as ready-to-serve gazpacho soup may not qualify for a "low fat" claim (Ref. 11), even though a serving of a cup might contain only 2 g of fat and be consistent with foods promoted in dietary guidelines. In addition, the agency does not believe that there is a sufficient basis to justify a higher level such as no more than 45 percent calories from fat, as suggested by one of the comments. Furthermore, national goals that target nutrient intake as a percentage of calories focus on the total diet, not on the percentage of calories in individual foods (Refs. 4, 7, and 12). Accordingly, the agency rejects a criterion based on caloric density for claims for nutrients other than saturated fat.

48. Several comments suggested as an alternative that FDA use a less restrictive weight-based criterion. Variants of this alternative were to use: (1) The disclosure/disqualifying levels per 100 g, (2) proposed levels per 30 g (one ounce), or (3) proposed levels per 50 g. One of these comments further stated that the use of the proposed levels per 30 g would be more closely tied to reference amounts and would allow truthful nutrient claims on the majority of foods, while preventing claims on nutrient dense foods with small serving sizes. This comment cited as a disadvantage, however, that this approach would still be arbitrary and not related to how consumers actually eat foods.

Another comment supported the use of proposed levels per 50 g because it would allow more grain products to qualify as "low fat." In addition, the comment stated that a per 50-g criterion would prevent higher fat crackers and cookies and other high fat foods with small serving sizes from making "low fat" claims. This comment further stated that the per 50-g criterion would allow more products to qualify for "low sodium" and "low cholesterol" claims and would result in more flexibility for manufacturers and more choices for consumers.

FDA considered the options presented in the comments for a less restrictive weight-based criterion. Upon reconsideration, the agency acknowledges that the level it proposed, per 100 g, is too restrictive. While the proposed criterion would have prevented "low" claims on certain nutrient dense foods, it also would have prevented some breads and other cereal grain products for which increased consumption is recommended in national dietary guidance from qualifying for "low" claims (Ref. 7). FDA has thus rejected maintaining the weight-based criterion as proposed.

The agency disagrees that a main reason for selecting a weight-based criterion should be the relationship of per 100 g, per 50 g, or per 30 g to the amounts of foods consumers actually eat. The criterion serves only as a measure of nutrient density. The reference amount reflects what consumers actually eat. However, FDA notes that a criterion based on proposed levels per 50 g or per 30 g would be more compatible with consumption amounts than per 100 g for individual foods, although 50 g or 30 g amounts would still be substantially greater than the reference amounts for some food products such as minor condiments.

While the agency acknowledges that the proposed criterion of 100 g is too restrictive, FDA is concerned that the alternative suggestions of applying the proposed disqualifying levels per 100 g (e.g., 11.5 g per 100 g for fat) or proposed levels per 30 g (e.g., 3 g per 30 g for fat, which is about 10 g per 100 g) could still result in misleading claims

even if the weight-based criterion is applied only to foods that have reference amounts of 30 g or less or 2 tablespoons or less. For example, with either of these criteria, evaporated whole milk and liquid nondairy creamers could still make "low fat" claims, and regular cream cheese could still make a "low sodium" claim (Ref. 6). In addition, the use of the per 30-g criterion when applied to foods with these reference amounts (i.e., 30 g or less or 2 tablespoons or less) could result in misleading "low calorie" claims on products such as half-and-half, olives, and maraschino cherries. Accordingly, FDA has not adopted these alternatives.

The agency also considered the alternative suggested in the comment of using proposed levels per 50 g. If a 50-g criterion was applied only to foods that have reference amounts of 30 g or less or 2 tablespoons or less, then all of the products cited above as inappropriate for "low" claims would be prevented from making misleading "low" claims (Ref. 6). In addition, compared with FDA's proposed per 100-g criterion, the per 50-g criterion would permit more foods for which increased consumption is recommended in current dietary guidelines to make "low" claims. For example, more breakfast cereals and snacks such as pretzels and air popped popcorn could make "low fat" claims.

The agency concludes that the use of a per 50-g criterion when applied to foods with reference amounts of 30 g or less or 2 tablespoons or less minimizes confusing or misleading claims while maximizing appropriate "low" claims consistent with dietary guidance. Accordingly, the agency is revising relevant paragraphs of new §§ 101.60, 101.61, and 101.62 to provide for a weight-based criterion for these foods be based on nutrient levels per 50 g of food for "low" claims. The agency is also revising new § 101.61(b)(2) to require that the per 50-g criterion apply to "very low sodium" claims.

49. One comment stated that a weight-based density criterion would be unduly restrictive to dry products such as dehydrated soups and dry hot cereals that require water to be added and that would qualify based on an "as prepared" form but not on the "as purchased" form. This comment suggested that a criterion based on the hydrated product would be more equitable for foods that must have water added to them before typical consumption.

The agency points out that the weight-based criterion in the final rule does not apply to dehydrated soups or dry hot cereals because their reference amounts exceed the specified reference amounts to which the weight-based criterion applies. However, the agency agrees with the comment that the weight-based criterion should be applicable to the "as prepared" form when the product purchased is dehydrated, because the reference amount of the product, as well as any accompanying nutritional information, is based on the hydrated form of the food. Thus, the agency concludes that it would be inconsistent to require that a weight-based criterion be based on the dehydrated form when all other accompanying information is based on the "as prepared" or hydrated form. Thus, the agency supports this recommendation for its limited application to dehydrated products with reference amounts of 30 g or less or 2 tablespoons or less. Accordingly, FDA is also revising the above cited sections by inserting "For dehydrated foods that are typically consumed when rehydrated with only water, the per 50-g criterion refers to the as prepared form," to allow products that must have water added to them before typical consumption to make a claim if the "as prepared" hydrated form meets the per 50-g criterion.

2. Need for consistency of terms and limited number of terms

As discussed in the general principles proposal (56 FR 60431), the agency's approach to developing a system of nutrient content claims emphasizes three objectives: (1) Consistency among definitions, (2) claims that are in keeping with public health goals, and (3) claims that can be used by consumers to maintain healthy dietary practices.

The agency also noted that it has followed an approach that will limit the number of defined terms. This approach is consistent with that advocated in the Report of the "Fourth Workshop on Nutritional Quality and Labeling in Food Standards and Guidelines," Committee on the Nutritional Aspects of Food Standards, International Union of Nutritional Sciences (IUNS) (Ref. 13), which states that caution should be exercised to constrain the number of descriptors that are considered desirable. The IUNS Committee questioned the wisdom of more detailed descriptors because of the difficulties of consumer understanding of a plethora of such terms.

Alternatively, the agency noted that some have argued that establishing flexible provisions for the use of terms will facilitate consumer understanding by better attracting attention to the message being delivered about the food. In addition, the agency noted that some have suggested that defining more terms or providing greater flexibility for the use of various terms to convey nutritional information encourages competition among products and fosters nutritional improvement in products. The agency specifically requested comments on how it can balance the goals of consumer understanding and competition (56 FR 60421 at 60431).

50. Some comments did not agree with the objective of maintaining consistency among the definitions. One comment stated that consumers will not be confused by the use of nonconsistent terms. One comment stated that because the proposed definitions for absolute nutrient content claims such as "low" and "high" are based on uniform standards that apply across all food groups, many foods that can help consumers improve their diets will not meet the standards in these definitions.

It is important for effective consumer education to establish consistent definitions for descriptive terms whenever possible to limit the possibility of consumer confusion. Thus, FDA has not made changes in its regulations in response to these comments. However, should a situation arise in which a flexible approach to defining a term would promote public health goals or assist consumers in maintaining healthy dietary practices, the agency will consider adopting such an approach. In implementing the provisions of the act on nutrient content claims (e.g., through the petition process), the agency intends not to inhibit useful and informative competition in the marketplace, so long as it is still consistent with the three objectives stated above.

3. Synonyms

Section 3(b)(1)(A)(ix) of the 1990 amendments provides that regulations for nutrient content claims may also include similar terms that are commonly understood to have the same meaning.

To implement these provisions, the agency requested in the general principles proposal (56 FR 60421 at 60431) comments on a list of synonyms suggested by the Grocery Manufacturers of America (GMA), for the terms "no," "very low," "low," "significant," "high," and "very high." The agency also requested comments on a report by the Institute of Medicine (IOM) of the National Academy of Sciences (NAS'), entitled, "Nutrition Labeling Issues and Directions for the 1990's" (the IOM report) (Ref. 14) addressing concerns that a proliferation of synonyms on food labels will be confusing to consumers

who may believe that there are differences among the terms. Further, the agency requested comments on the use of synonyms for the nutrient content claims "free," "low," "high," and "source."

Section 403(r)(4)(A)(ii) of the act grants to any person the right to petition the Secretary (and FDA, by delegation) for permission to use terms in a nutrient content claim that are consistent (i.e., synonymous) with terms defined in regulations issued under section 403(r)(2)(A)(i).

51. Several comments stated that it is important to limit the number of synonyms, while some comments advocated that FDA ban the use of all synonyms. The comments argued that the 1990 amendments do not require synonyms, that the use of synonyms does not contribute to improved public health, and that synonyms are used by companies only to gain a competitive edge.

Some comments suggested that all synonyms put forward by GMA should be accepted. The comments generally contended that synonyms are necessary to allow manufacturers greater flexibility; that there are many truthful and informative synonyms for the basic descriptors FDA is defining; that all terms will carry some defined meaning; that use of multiple synonyms will encourage competition among products; and that as long as there is a single definition for a term and its synonyms, consumers will not be confused.

A few comments stated that FDA should permit undefined synonyms to be used in conjunction with either a consistent defined claim or a disclosure statement explaining the intended meaning. The comments argued that this approach would increase consumer understanding and confidence, without discouraging manufacturers' flexibility.

Another comment stated that qualitative research is needed to assess consumer understanding of descriptors before the publication of final regulations, and if such testing is not possible, definitions and synonyms should be tentative for 2 years and then reassessed.

FDA notes that many comments advocated either an extremely open or extremely restrictive approach to synonyms. However, FDA has not taken either of these positions. Because a goal of the 1990 amendments is to make nutrition information on the label or labeling of foods available in a form that consumers can use to follow dietary guidelines (H. Rept. 101–538, supra, 10), and the act envisions that synonyms for defined terms can be an appropriate means to communicate such information, the agency will evaluate synonyms according to the standard in the 1990 amendments, i.e., that the term is commonly understood to have the same meaning as a defined term. In doing so, FDA intends to be open to considering terms that meet this standard. However, FDA does not intend to permit any synonym that it believes would be unclear in meaning to consumers with respect to characterizing the level of a nutrient in a food. For instance, FDA does not consider the term "smidgen" to be commonly understood to mean "very low" in describing the level of a nutrient. Similarly, FDA does not consider the term "loaded" to be commonly understood to mean "high."

FDA disagrees with the comments that suggested that the terms and synonyms being established in this final rule should be permitted on a tentative basis for 2 years. FDA has sought to select terms and synonyms that are familiar to consumers. The standardization of these terms by regulation and the availability of nutrition labeling in conjunction with the claims, coupled with consumer education, will promote consumer understanding of their meaning. Thus, FDA believes that consumers will be able to use the terms and synonyms that it is defining to make informed dietary choices. Further, through petitions and rulemaking, FDA can change, add, or delete synonyms as new terms come to have established meanings or problems with defined terms become apparent.

FDA also disagrees with the suggestion that it permit undefined synonyms to be used in conjunction with either a consistent defined claim or a disclosure statement explaining its intended meaning, because the act requires that terms (including synonyms) used to characterize the level of a nutrient in a food be either defined by the agency or approved by the agency in response to a petition. There is no provision in the act that allows for the use of undefined synonyms in the absence of action by the agency.

In this document, FDA has considered various synonyms that have been suggested in the comments. The issues considered by the agency and its conclusions regarding specific synonymous terms are discussed in detail in the relevant sections of this document.

B. Terms Describing the Level of a Nutrient

1. Free

In the general principles and the fat/cholesterol proposals (56 FR 60421 and 60478), FDA proposed to define the term "free" for total fat, cholesterol, sodium, sugars, and calories. FDA also proposed to define the terms "no," "zero," "trivial source of," "negligible source of," and "dietarily insignificant source of" as synonyms for the term "free." The agency specifically requested comments on whether consumers commonly understand the meaning of all these terms to be, and whether the terms are in fact, synonymous.

In arriving at the proposed definition for "free" for each nutrient, the agency chose the level of the nutrient that is at or near the reliable limit of detection for the nutrient in food and that is dietetically trivial or physiologically inconsequential. The agency noted, however, that some manufacturers may add very small amounts of certain nutrients to aid in the manufacturing process for some products. FDA proposed not to allow use of the term "free" on such products, even if the products met the quantitative criteria for use of the term. However, the agency requested comments on whether "free" claims should be allowed on these products if they provide an appropriate disclosure statement and also on what such a disclosure statement should be.

FDA also proposed that "free" claims used on foods that are inherently free of a nutrient must refer to all foods of that type and not merely to the particular brand to which the labeling is attached. The agency requested comments on this provision.

a. Synonyms. A number of comments addressed synonyms proposed by FDA for "free" in the general principles and the fat/cholesterol proposals (56 FR 60421 and 60478). Many of these comments supported the use of synonyms for "free." Several comments agreed specifically with one or more of FDA's proposed synonyms for "free" such as "no" or "zero." One comment provided data showing that "free" and "no" are synonymous terms. Another comment provided data that "free" and "without" are synonymous terms.

52. At least one comment (a Ph.D. thesis) requested that the term "without" be a synonym for "free." The comment presented data in support of its request. This investigation (Ref. 15) was conducted at the University of South Dakota using 192 undergraduate students. The students' perceived notions of the amount of calories, fat, and cholesterol relative to 12 nutrient content claims terms were examined. The results demonstrated statistically that the participants perceived that "without" and "free" have the same meaning.

FDA agrees with this comment. The data presented, along with FDA's previous approval of the claim "without added salt," persuade the agency that "'without' should be a synonym for 'free'." Accordingly, the agency is revising new § 101.60(b)(1) on calories, new § 101.60(c)(1) on sugar, new § 101.61(b)(1) on sodium, new § 101.62(b)(1) on fat, new § 101.62(c)(1) on saturated fat, and new § 101.62(d)(1) on cholesterol, to allow "without" to be a synonym for "free."

53. One comment maintained that manufacturers are likely to abuse the terms "free" and "no."

FDA believes that most manufacturers will comply with the requirements of these regulations. However, manufacturers who violate the requirements for these definitions will be dealt with by appropriate regulatory action.

54. One comment suggested that "free" be used where there is an absence of a nutrient, and that a phrase such as "very small amount of" be used where the food contains very small amounts of a nutrient, even if the amount of the nutrient present is physiologically insignificant.

FDA rejects this suggestion. As discussed in the general principles proposal (56 FR 60421 at 60432), FDA believes that it is appropriate to apply the term "free" to a nutrient when a food contains that nutrient in a dietetically trivial or physiologically inconsequential amount, even though the nutrient is present at a level at or near its reliable limit of quantitation. With modern analytical methods, the level at which the presence of a nutrient may be quantified is becoming increasingly smaller. For example, there are almost no foods that can be said to be truly sodium free, yet the level of sodium present in some foods has no impact on the diet. Furthermore, the additional term would likely cause consumer confusion because it is ambiguous and would not be clearly distinguishable from "free" in a meaningful way.

55. One comment stated its support for the use of the word "none." Another comment suggested that "none" be used instead of "free" but gave no reason for this suggestion.

The comment did not provide sufficient supporting information to persuade the agency that consumers commonly understand "none" to have the same meaning as "free." Therefore, FDA is not providing for the use of "none" as a synonym for "free" at this time. However the agency advises that interested persons may submit a synonym petition for the use of this term as prescribed in new § 101.69.

56. Several comments supported the synonyms for "free" that contain "source of" language (i.e., "trivial source of," "negligible source of," "dietarily insignificant source of"). One comment stated that the de minimis nutrient threshold levels encompassed by such phrases are of no public health concern. Several comments disliked these proposed synonyms. Some of these comments asserted that these phrases could be confusing or misleading to consumers. One comment pointed out that the inclusion of the word "source" in some of the synonyms for "free" could confuse consumers because the agency had given another meaning to this word in the general principles proposal.

In this final rule, as explained later in this document, FDA is changing the descriptive term "source" to "good source" to clarify its meaning and relative position in the hierarchy of descriptive terms. As a result, FDA does not believe that the use of the words "———— source of" in some synonyms for "free" will be confusing to consumers. Therefore, FDA is maintaining the position that it took in the general principles proposal (56 FR 60421 at 60434) that the terms "trivial source of," "negligible source of," and "dietarily insignificant source of" are suitable synonyms for "free," provided that they are used on the labels or in labeling of foods in accordance with the agency's definition.

57. Another comment stated that, unlike "no" and "zero," which are absolute terms, the terms containing the language "———— source of" could be misinterpreted.

FDA acknowledges that "free," "no," and "zero" are absolute terms that are synonymous to one another in their meaning. However, FDA also believes that the "———— source of" terms that it has listed as synonyms of "free" are appropriate for use on the food label and consistent with the agency's definition for "free" because they express that the nutrient is present at or near the reliable limit of detection and thus at a dietetically trivial or physiologically inconsequential level. Therefore, FDA concludes that no change is warranted in response to this comment.

58. One comment objected to the use of the phrases "trivial source of," "negligible source of," and "dietarily insignificant source of" as synonyms for "free" because such phrases equate the presence of trivial amounts of a nutrient with the absence of a nutrient. The comment asserted that people can experience life-threatening reactions to "trivial" amounts of substances.

FDA does not agree that these phrases are inappropriate as synonyms for the "free" nutrient content claims that are being defined in this final rule. As explained above, FDA defined the term "free" based on a dietarily insignificant amount of the nutrient in question, and these terms are consistent with that definition.

Further, FDA advises that the nutrient content claims that it is defining in this final rule provide consumers with information about nutrients in a food, and not about substances in foods that consumers may need to avoid because of allergies or intolerances. A consumer should read the ingredient list on the food label to determine whether a food contains a substance he or she needs to avoid.

59. Several comments suggested that FDA include the terms "not any," "not a bit," "not a trace," "never a bit," "never a trace," "negligible," "dietary isignificance," "trivial amount of," and "meaningless" as synonyms for "free."

These comments did not provide sufficient supporting information to persuade the agency that consumers commonly understand the terms "not any," "not a bit," "not a trace," "never a bit," "never a trace," "negligible," "dietary insignificance," "trivial amount of," and "meaningless" to have the same meaning as "free." Therefore, FDA is not providing for the use of any of these terms as synonyms for "free" at this time. However the agency advises that interested persons may submit a synonym petition for the use of any of these terms as prescribed in new § 101.69 of this final rule.

60. Some comments suggested that variations in spelling be allowed for descriptors and their synonyms.

Although FDA has not specifically provided for variations in the spelling of various descriptive terms or their synonyms, except for "light" ("lite"), the agency believes that reasonable variations in the spelling of these terms would be acceptable, provided that these variations are not misleading to consumers. However, should the agency encounter terms that use questionable variations in spelling, it will evaluate these variations on a case-by-case basis to determine whether they comply with section 403(a) and (r) of the act.

b. Statutory limitations on circumstances in which an absence ("free") claim may be made. The 1990 amendments describe the circumstances in which claims that state the absence of a nutrient may be made on a food. Section 403(r)(2)(A)(ii)(I) and (r)(2)(A)(ii)(II) of the act, respectively,

provide that a claim may not state the absence of a nutrient unless: (1) The nutrient is usually present in the food or in a food which substitutes for the food as defined by the Secretary (and FDA, by delegation), or (2) the Secretary by regulation permits such a statement on the basis of a finding that such a statement would assist consumers in maintaining healthy dietary practices, and the statement discloses that the nutrient is not usually present in food.

i. Substitute foods. In the general principles proposal (56 FR 60421 at 60432), FDA proposed to define when one food may be considered to substitute for another to eliminate any confusion that may arise over this issue. In § 101.13(d), FDA proposed that a substitute food is one that is used interchangeably with another food that it resembles in its physical, organoleptic, and functional characteristics, and that it is not nutritionally inferior to that food unless it is labeled as an "imitation." The agency also proposed in § 101.13(d)(1) that a food that does not possess the same characteristics as the food for which it substitutes must declare the difference on its label or in its labeling, adjacent to the most prominent claim. FDA also proposed in § 101.13(d)(2) that any declaration (i.e., disclaimer) made regarding the different characteristics of the substitute food should be in easily legible print or type, no less than one-half the size of the descriptive term.

The agency also stated in the proposal that it believes that identifying imitation foods that meet nutrient content claim definitions may provide a benefit to the consumer, even though they are nutritionally inferior. Therefore, FDA tentatively concluded that such foods should be allowed to bear nutrient content claims, as long as they are appropriately labeled.

61. A few comments agreed with FDA's proposed definition for substitute foods. Some of the supporting comments stated that regulations governing the use of substitute foods are necessary to avoid misleading consumers who are not aware of the dissimilarities between an original food and a food that serves as a substitute food. However, one comment stated that the agency lacks the legal basis to prescribe the use of disclosure statements on substitute foods as extensive as that proposed by the agency. This comment suggested that a disclaimer statement should not be required on substitute foods, and that the required statement is excessive and will result in a label that is confusing to consumers.

The agency disagrees with the comment that FDA has no legal basis to require disclaimer statements on substitute foods. As the agency stated in the proposal (56 FR 60421 at 60432), section 201(n) of the act provides that food labeling is misleading, and thus the food is misbranded under section 403(a) of the act, if it fails to disclose facts material to the consequences of the use of the food. For example, if a food has different performance characteristics than the food for which it substitutes, this fact must be disclosed in conjunction with the claim that draws a connection between the two foods. Under sections 201(n), 403(a), and 701(a) of the act, the agency has the authority to require disclaimer statements when these statements are necessary to disclose material facts.

The agency also disagrees with the contention that disclaimer statements will confuse consumers. The agency believes that this information is of value to consumers because it informs them about important aspects of the food that otherwise would not be evident.

62. Some comments addressed specific aspects of disclaimer statements. One comment that opposed the agency's proposed definition for a substitute food stated that the proposal is overly broad, and that FDA should limit the disclosure requirements to differences that materially limit the uses of a substitute food when compared to the food it resembles.

The agency has reconsidered its proposed requirements for disclaimer statements. FDA believes that "differences in performance characteristics" between a substitute food and an original food may include minor differences that consumers would consider relatively unimportant for that food (e.g., a different freezing point for a nonfat thousand island dressing substitute). The agency believes that such differences are significant only when they materially limit the use of the food compared to the use of the original food (e.g., "not recommended for frying"). FDA concludes that when the differences between the substitute food and the original food do not limit the use of the substitute, they need not be disclosed because they would not be considered to be material facts that relate to the consequences of the use of the food. Therefore, the agency is revising new § 101.13(d)(1) to state, that:

> If there is a difference in performance characteristics that materially limits the use of the food, the food may still be considered a substitute if the label includes a disclaimer adjacent to the most prominent claim as defined in paragraph (j)(2)(iii) of this section, informing the consumer of such difference (e.g., "not recommended for frying").

Furthermore, to ensure that the disclaimer is presented with appropriate prominence, consistent with the requirements for other required supplementary information (e.g., referral statements), the agency is revising new § 101.13(d)(2) to read:

> This disclaimer shall be in easily legible print or type and in a size no less than that required by § 101.105(i) for the net quantity of contents statement except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the disclaimer statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth inch.

63. A few comments stated that "shelf life" should be deleted from the definition because future developments may result in superior substitute foods with a longer shelf life.

The agency rejects this comment. The agency believes that, for two foods to be considered to be used interchangeably, they should generally resemble each other with respect to shelf life. However, the agency points out that the definition does not require that the substitute possess the same shelf life characteristics as the original food. As revised, the regulation would only require disclosure of the shelf life of the substitute food if that information is a material fact, as discussed in the previous comment.

64. One comment requested that FDA provide clarification in the final rule that differences in shelf life can be disclosed through code dates or freshness guarantee statements.

When shelf life information is required under the revised provisions, it would be appropriate to disclose the information through code dates or freshness guarantee statements if this information is presented in a readily understandable manner, in accord with the other requirements for disclaimers.

65. One comment suggested that any differences in performance characteristics associated with substitute foods should be located in the bottom 30 percent of the PDP as provided for in proposed § 101.67(b). This comment argued that proposed § 101.13(d)(1) should be revised to conform to that provision.

FDA rejects this comment. The agency believes that the disclaimer should be adjacent to the most prominent claim as it proposed because of the importance of the information. Further, the agency also notes that in the final rule on the use of nutrient content claims for butter, which appears elsewhere in this issue of the Federal Register, it is revising new

§ 101.67 to be consistent with new § 101.13(d)(1).

66. One comment argued that the dietary, health, and economic consequences regarding the use of substitute foods have not been addressed. This comment stated that the nutritional science associated with substitute foods is insufficient to fully determine whether they should be considered equivalent to traditional foods.

FDA is not authorized under the act to judge the dietary, health, or economic consequences of the use of substitute foods. Under section 403(r)(2)(A) of the act, foods that substitute for other foods must satisfy certain requirements if they are to bear nutrient content claims that highlight differences between them and the foods for which they substitute (see, e.g., section 403(r)(2)(A)(ii)(I) of the act). By issuing these labeling provisions for substitute foods, FDA has not judged that substitute foods are equivalent to traditional foods. These provisions are intended to ensure that material differences between the use of the substitute food and the use of the original food are conspicuously stated on the label or labeling of the food, so that consumers can make fully informed judgments about their value and their usefulness in maintaining healthy dietary practices.

67. A few comments expressed the view that consumers may not understand the difference between substitute foods and imitation foods. One of these comments suggested that data should be used to evaluate consumer perception on the differences between these terms.

FDA is not aware of any consumer confusion from the use of the terms "substitute" and "imitation" on food labels, nor did these comments provide any information to show that such confusion exists. Imitation foods are a subgroup of substitute foods. Under § 101.13(e), imitation foods are defined as being nutritionally inferior to the foods for which they substitute and that they resemble. FDA believes that the labeling requirements for substitute, and imitation foods will enable consumers to understand the nature of each of these types of foods. Therefore, FDA is making no change in response to these comments.

ii. Foods inherently free of a nutrient. In the general principles proposal (56 FR 60421 at 60433), the agency proposed for calories in § 101.60(b)(1)(ii) and sodium in § 101.61(b)(1)(iii) that if a food is inherently free of the nutrient, without the benefit of special processing, alteration, formulation, or reformulation to lower the content of that nutrient, a "free" claim on such food must refer to all foods of that type and not to a particular brand. In the fat/cholesterol proposal, the agency proposed a similar requirement for foods inherently cholesterol free (proposed § 101.62(d)(1)(i)(D) and (d)(1)(ii)(E)) or fat free (proposed § 101.62(b)(1)(iii)).

FDA proposed to establish this approach as a general requirement for nutrient content claims for "free" and claims for "low" in § 101.13(e)(2). Conversely, the agency provided in proposed § 101.13(e)(1) that, if a food has been processed, altered, formulated, or reformulated to remove the nutrient from the food, it may appropriately bear the terms "free" or "low" before the name of the food. FDA specifically requested comments on the proposed provision allowing "free" or "low" claims on foods that do not usually contain, or are usually low in, a nutrient.

68. A few comments stated that the agency should not allow use of the statement "————, a (nutrient) free food," on processed foods that do not normally contain the nutrient. These comments contended that this approach would eliminate the use of claims where the only benefit is to the manufacturer.

The agency rejects this comment. The agency believes, as stated in the proposal (56 FR 60421 at 60433), that highlighting that a food is free of a nutrient can help consumers to maintain healthy dietary practices whether the food is inherently free of that nutrient or is processed to be that way. Further, FDA believes that when a food is inherently free of a nutrient as a result of how it has been formulated, the disclosure "————, a (nutrient) free food" is necessary to prevent "(nutrient) free" claims from being misleading.

69. One comment argued that FDA should consider use of the term "naturally low in fat" instead of "————, a fat free food." Another comment preferred more flexibility in the wording of nutrient qualifiers (e.g., "as always, sodium free" or "naturally sodium free").

FDA points out that new § 101.13(e)(2) does not dictate the precise wording that manufacturers are to use to advise consumers that the food inherently meets the criteria and to clearly refer to all foods of that type. Therefore, the agency believes that the regulation contains sufficient flexibility with respect to the wording of the required qualifier. FDA will assess qualifying statements used on labels to determine whether the wording used meets the requirements of the regulations and take action on those that do not. Clearly, all such possible qualifiers do not meet the regulatory criteria. For example, FDA believes that the term "always" as used in the disclosure statement suggested by the comment does not clearly indicate that all foods of that type are also free of the nutrient. Thus, it may be interpreted to mean that only that brand of the food is free of the nutrient, and, as such, the claim is misleading.

70. Some comments opposed use of the statement "a fat free food" on foods that are inherently fat free. These comments stated that foods naturally "fat free" are placed at a disadvantage as compared to foods that have been modified to lower their fat level. One comment suggested that use of the term "fat free" instead of "————, a fat free food" should be appropriate on foods that are inherently fat free.

The agency disagrees with these comments. FDA continues to believe that when a "fat free" claim is made on foods that are inherently free of that nutrient, the claim is misleading unless it is accompanied by a statement that all foods of that type are inherently fat free. Thus, the agency is not providing for the use of "fat free" without the disclaimer on foods that are inherently fat free.

71. One comment requested clarification of proposed § 101.13(e)(1). The comment noted that the language of that section allows only those foods that are formulated, reformulated, specially processed, or altered to remove a nutrient from the product to bear the claim "free" or "low" before the name of the food, without the generic statement that all foods of that type are "free" of, or "low" in, that nutrient. The comment asserted that it is not clear whether a food that has been formulated to not include a nutrient that could be present in the food would be allowed to bear a claim addressed by proposed § 101.13(e)(1). For example, potato chips, fried in vegetable oil are free of cholesterol because the oil is cholesterol free, while potato chips fried in lard are not cholesterol free because of the cholesterol introduced by the lard. The comment emphasized that such foods are not "inherently free" of a nutrient but have instead been formulated so that the nutrient is not added. The comment recommended that the agency allow the terms "free" and "low" to be used on such products.

FDA agrees that there is a need for clarification in proposed § 101.13(e)(1) to allow for the use of "free" and "low" claims on foods that are formulated in such a way that certain nutrients that may be present in the food are not added to the product. The agency

believes that formulating a food in a way that precludes certain nutrients from being added to the food is equivalent to processing a food such that the nutrient is removed from the product. Thus FDA has modified new § 101.13(e)(1) to state:

> Because the use of a "free" or "low" claim before the name of a food implies that the food differs from other foods of the same type by virtue of its having a lower amount of the nutrient, only foods that have been specially processed, altered, formulated, or reformulated so as to lower the amount of the nutrient in the food, remove the nutrient from the food, or not include the nutrient in the food may bear such a claim (e.g., "low sodium potato chips").

FDA believes that this amendment will alleviate any confusion concerning the appropriate use of "free" and "low" claims.

72. A few comments suggested that FDA should expand its criteria for claims regarding the absence of a nutrient to encompass foods produced by modern advances in technology, e.g., biotechnology, horticulture, or crop selection.

FDA's criteria for nutrient content claims apply to all foods. The agency is not aware of special needs with respect to foods of the types mentioned in the comment and cannot conclude at this time that special provisions in the regulations are needed for these foods.

c. Specific definitions

i. Sodium free and terms related to salt

73. Several comments objected to the provision in proposed § 101.61(b)(1)(ii) that a food containing added salt (sodium chloride) or any ingredient that contains sodium cannot be labeled "sodium free," even though it still contains 5 mg or less of sodium per serving. One of these comments stated that "free" terms should be based solely on the analytical definition, and that consumer education programs should be set up to explain the definitions. Other comments agreed that the food should not contain any added sodium chloride but believed that disallowing ingredients containing sodium was unnecessary and overly restrictive. A trade association for the cracker industry said that for years "sodium free" crackers have been used at hospitals for patients on sodium-restricted diets. Because these crackers are made with enriched wheat flour that naturally contains trivial amounts of sodium, they could not continue to be marketed as "sodium free" under the proposed rule. This comment requested that proposed § 101.61(b)(1)(ii) be entirely eliminated or modified to allow a "sodium free" claim when a food has ingredients that contain naturally occurring sodium.

Alternatively, some comments totally supported the proposed rule. They agreed that the listing of salt as an ingredient of a product bearing a "sodium free" claim is confusing, and, therefore, its addition should be disallowed. Other comments suggested that the confusion could be eliminated if the label of such a product explained that the product contains a trivial amount of sodium. Most of these comments preferred that such a disclosure appear in the ingredient statement.

The agency has reconsidered the provision that disallows the addition of sodium chloride or ingredients that contain sodium to foods that bear a "sodium free" claim and is persuaded that it is unduly restrictive. The agency accepts the recommendation that the proposed provision be eliminated, and that a disclosure statement be required to avoid consumer confusion about the quantity of sodium in the food. The agency is persuaded that it is the listing of salt (sodium chloride) or related substances that are generally understood by consumers to contain sodium (e.g., baking soda or ingredients with sodium as part of their common or usual name such as sodium ascorbate) that creates the confusion. Accordingly, the agency is revising new § 101.61(b)(1)(ii) to require that the listing of these ingredients in the ingredient statement be followed by an asterisk that refers to a disclosure statement appearing below the list of ingredients. The statement is to read: "adds a trivial amount of sodium," "adds a negligible amount of sodium," or "adds a dietarily insignificant amount of sodium." The agency concludes that ingredients that may contain trivial amounts of sodium, such as enriched flour used in making crackers, do not contribute to consumer confusion and, thus, do not need a disclosure statement.

74. One comment requested that any label on which the term "sodium free" appears be required to include the disclosure, "contains less than 5 mg of sodium per serving." This comment stated this disclosure would alert consumers to the possible presence of a dietarily insignificant amount of sodium, and, thus, an ingredient list that includes a sodium-containing compound would no longer be a potential source of confusion.

The agency disagrees with this recommendation because it believes that requiring a disclosure with all "sodium free" claims is not necessary and would add to label clutter. In the document on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**, FDA is concluding that less than 5 mg of sodium is a dietarily insignificant amount and may be declared as "0" in the nutrition label. The agency sees no reason to take a different position with respect to the nutrient content claim. Disclosing the quantitative amount of sodium on a label that bears a "sodium free" claim and declares "0" sodium in the nutrition label would only create consumer confusion. Accordingly, the agency is not revising new § 101.61(b)(1) to require the requested disclosure.

75. A few comments requested that products not meeting the "sodium free" definition because they contain 5 mg or more of naturally occurring sodium should be allowed to use the claim "unsalted" ("without added salt," "no salt added") without having to disclose "not a sodium free food." One comment stated that there is virtually no risk that a consumer would associate "unsalted" as being synonymous with "sodium free." Another comment requested that the term "unsalted" be a synonym for "salt free" foods. Other comments disagreed and supported the requirement for a disclosure.

The term "unsalted" ("without added salt" or "no salt added") on a food that is not sodium free and that does not disclose that it is "not a sodium free food" could mislead consumers, as explained in the proposed rule (56 FR 60435). The comments presented no evidence that consumers would not be confused by this claim without the disclosure. Therefore, the agency is not persuaded to change its position on the need for the disclosure. However, to reduce the amount of information required on the principal display panel, the agency will allow this disclaimer to be placed in the information panel. The referral statement required by section 403(r)(2)(5) of the act will refer the consumer's attention to the information panel. This statement will ensure that this material fact is brought to the consumer's attention through a statement made in conjunction with the claim. Accordingly, the agency is changing the required location of this disclosure in § 101.61(c)(2)(iii).

Furthermore, the agency does not agree that the term "unsalted" should be used as a synonym for the term "salt free." To confine "unsalted" claims only to foods that meet the "sodium free" definition, including foods bearing a "salt free" claim, would be overly restrictive. The agency is denying this request.

76. One comment stated that for over 25 years, cracker manufacturers have been making crackers with no surface

salt that are described on their labels as "Unsalted Tops * * * Crackers." These crackers are made with sodium chloride and baking soda and have never claimed to be low or reduced in sodium. The comment says that these products meet the desire of some consumers for crackers that taste less salty. The comment asked whether this name can continue to be used in light of proposed § 101.61(c)(2)(i), which specifies that the term "unsalted" may only be used on a food label if no salt is added to the food during processing. It requested that the rule be modified to allow for the use of the name "Unsalted Tops * * * Crackers" as well as other names in which the term "unsalted" is qualified and does not refer to the entire food.

The use of the term "unsalted," as it appears in the name "Unsalted Tops * * * Crackers," modifies the word "tops." When used in this context, "unsalted" does not refer to the salt content of the entire food. For this reason, the agency does not consider this use of the term "unsalted" to be subject to the requirements of new § 101.61 and does not believe that this rule needs to be modified to allow for the use of this name or other names in which the term "unsalted" is qualified in this manner. Accordingly, the agency has not revised the definition of "unsalted."

77. One comment stated that it is misleading for plain corn to claim "no added salt" when frozen corn does not have added salt.

In the absence of details in the comment, the agency presumes that this comment is referring to canned corn by the term "plain corn." The agency has a food standard (§ 155.130) for canned corn that permits salt as an optional ingredient and understands that salt is usually added to this product. The agency believes that if no salt is added to canned corn, the food that it resembles and for which it substitutes is canned corn, not frozen corn. Therefore, the agency concludes that it is not misleading for the product to bear the claim "no added salt."

ii. Sugar free. 78. At least one comment recommended that FDA define the term "sucrose free" instead of "sugars free."

The agency disagrees. Sucrose is only one of the sugars found in foods. For this reason, the agency believes that the term "sucrose free" would mislead consumers into believing that the food is free of all sugars. Accordingly, the agency is not defining "sucrose free."

79. At least one comment recommended that FDA define the term "no refined sugar."

The agency is not accepting these comments. The agency is concerned that consumers would be misled into believing that a food containing no refined sugar is better than a food containing refined sugar. The dietary guidelines (Ref. 7) advise Americans to consume sugars in moderation. Consumers need to understand that it is the amount of dietary sugar, not whether or not it is refined, that is important in following the guidelines. Accordingly, the agency is not defining the term "no refined sugar."

80. A couple of comments requested that the term "sugar free" be used instead of the term "sugars free." One comment said that the term "sugar free" would be in harmony with the term permitted in Canada and other countries. Another comment stated that although the term "sugars free" is technically correct, it is unfamiliar and will confuse the majority of consumers. The comment expressed doubt that consumers understand or care about FDA's reasons for proposing "sugars free" and believed that only a few consumers would notice that the listing in the nutrition label is for "sugars," not "sugar."

The agency is persuaded, based on the arguments made by the comments, that the term "sugars free" may be confusing to consumers. Accordingly, the agency is defining the term as "sugar free" in § 101.60(c)(1). The agency points out that this section provides that a food label may bear this claim if the food contains less than 0.5 g of sugars, as defined in new § 101.9(c)(6)(ii) in the final rule on mandatory nutrition labeling, published elsewhere in this issue of the **Federal Register** (redesignated from § 101.9(c)(6)(ii)(A) in the proposal). FDA proposed to define "sugars" as the sum of all free mono- and oligosaccharides through four saccharide units and their derivatives (such as sugar alcohols). However, as discussed in the final rule on nutrition labeling, in response to comments, the agency is changing the definition to include only mono- and disaccharides. Thus, the term "sugar free" refers to less than 0.5 g of mono- and disaccharides.

81. At least one comment requested that FDA define "sugar free" as free of all simple sugars.

FDA disagrees with this comment. As explained in the above section, the agency is defining "sugar free" as less than 0.5 g of sugars, that is mono- and disaccharides. FDA believes that this terminology is more precise than the term "simple sugars."

82. Numerous comments requested that the term "sugar free" be allowed to describe foods containing sugar alcohols (polyols). These comments suggested that FDA either should exclude sugar alcohols from the definition of "sugars" or should broaden the exemption in proposed § 101.13(o)(8) that allows the term "sugar free" on the label of chewing gums that contain sugar alcohols. The comments requested that foods containing sugar alcohols, such as soft candies, hard candies, breath mints, lozenges, and sodas, be included in the exemption. Alternatively, a few comments stated that allowing the claim "sugar free" on chewing gums would be confusing to consumers if sugar alcohols are included in the definition of sugars. One of these comments proposed that the claim on chewing gums should be "contains sugar alcohols" rather that "sugar free." Other comments suggested that the claim on chewing gums as well as other foods containing sugar alcohols should be "sugarless" to avoid confusion with foods meeting the definition of "sugar free." They believed that this term should be allowed only for foods that typically contain sugar, are modified to contain only sugar alcohols, and do not contain other carbohydrates.

The agency has reconsidered this issue and is persuaded that the term "sugar free" should be allowed to describe foods containing sugar alcohols. As described above, the agency is changing the definition of sugars to include only mono- and disaccharides. Thus, sugar alcohols are no longer included in this definition. A food containing sugar alcohols may bear a "sugar free" claim as long as it meets the requirements in new § 101.60(c)(1) for "sugar free" and in new § 101.9(c)(6)(iii) that polyol content be disclosed, as discussed in the final rule on nutrition labeling published elsewhere in this issue of the **Federal Register**. Accordingly, the agency is deleting proposed § 101.13(o)(8) because the exemption that is provided is no longer needed.

83. Numerous comments supported the statement "useful only in not promoting tooth decay" in proposed § 101.13(o)(8), to continue to allow on the label of chewing gums that claim to be "sugar free." Many of the comments requested that the statement be allowed on the labels of other foods containing sugar alcohols that claim to be "sugar free." One comment suggested that FDA should revise the definition of "sugars" to exclude sugar alcohols and revise proposed § 101.60(c)(1)(iii)(B) to allow the requested statement to accompany "sugar free" claims. This provision, as proposed, would require either the statement "not a reduced calorie food," "not a low calorie food," or "not for

weight control." Other comments suggested that FDA should broaden the exemption in proposed § 101.13(o)(8) to allow the requested statement to appear on other foods. Alternatively, at least one comment suggested only the statements "not a reduced calorie food" and "not a low (free) calorie food" are appropriate. The comment specifically suggested that FDA should disallow the statement "useful only in prevention of tooth decay" with "sugar free" claims. This comment also implied that FDA should disallow the statement "not for weight control" with "sugar free."

The agency has reviewed these comments and has determined that there is no compelling reason to disallow the statement "not for weight control." However, the agency has concluded that the statement "useful only in not promoting tooth decay" should not be allowed because it is an unauthorized health claim. In the general principles proposal (56 FR 60437), the agency stated that it intended to reevaluate the usefulness of chewing gums sweetened with sugar alcohols in not promoting tooth decay. The agency acknowledged that the data supporting the claim were over 20 years old and requested new data. The agency received data in response to the request and will make a determination on the validity of this claim in accordance with the final rule on health messages published elsewhere in this issue of the **Federal Register**. Accordingly, the agency is not revising § 101.60(c)(1)(iii)(B) to allow the statement "useful only in not promoting tooth decay" to appear with "sugar free" claims.

The agency is deleting the exemption in proposed § 101.13(o)(8) that would have allowed a "sugar free" claim on chewing gums containing sugar alcohols and the statement about not promoting tooth decay. As explained above, this exemption is no longer needed because the agency has decided not to define sugar alcohols as "sugars."

84. Many comments requested that FDA revise proposed § 101.13(o)(8) to allow the statement "Toothfriendly" to accompany "sugar free" claims on the label of chewing gums in place of the statement "useful only in not promoting tooth decay." In addition, these comments requested that such statements may be accompanied by a pictogram of a smiling tooth. These comments stated that the term "Toothfriendly" is more readily understood by consumers with limited reading and vocabulary skills. One comment said the "Toothfriendly" dental education programs have been successfully promoted in several European countries by "Toothfriendly Sweets International," a nonprofit organization dedicated to promoting dental health. The agency received at least one comment opposing the term "Toothfriendly." The comment contended that the "Toothfriendly" program is just another third party endorsement program similar to those the agency has considered in the past. It stated that the claim is unsupported by any evidence and would promote the consumption of foods that are completely without nutritive benefit.

The agency is denying this request because it believes that the statement "Toothfriendly" accompanied by a pictogram of a smiling tooth is an implied health claim that, unless a regulation is established, is unauthorized (see section 403(r)(1)(B) of the act). As discussed in the previous comment, the agency has not made a determination that chewing gums sweetened with sugar alcohols are useful in not promoting tooth decay.

85. A few comments stated that the definition of "sugar free" should be less than 4 g per serving. They said that they selected this value because it is the dietary requirement for diabetics. Another comment requested that the term "sugar free" be accompanied by the statement: "For use in diabetic meal plans. Not a reduced calorie food (if appropriate)."

The agency does not agree that "sugar free" should be less than 4 g of sugars per serving as explained in the general principles proposal (56 FR 60421 at 60436). The agency emphasized there that the definitions of nutrient content claims do not specifically address issues related to diabetes management practices, and that diabetes management should not be based solely on the consumption of "sugar free" foods. Rather, diet planning for diabetics should encompass the entire diet and be supervised by a trained professional. The agency notes that the American Diabetes Association (ADA) submitted a comment that expressed strong support for defining "sugar free" at less than 0.5 g per serving. It stated that the amount of sucrose or other sweeteners in their recipes should not be used in the context of support for defining this claim. Accordingly, the agency is not defining "sugar free" as less than 4 g per serving. Consistent with this policy on "sugar free," the agency also denies the request that "sugar free" claims be accompanied by the statement, "For use in diabetic meal plans. Not a reduced calorie food."

86. A couple of comments objected to the provision in proposed § 101.60(c)(1)(ii) that a food containing added ingredients that are sugars cannot be labeled "sugar free," even though it still contains less than 0.5 g of sugars. One comment stated that FDA should not distinguish between trivial amounts present naturally, and those present because they were added. Other comments supported the proposal. They agreed that the listing of a sugar, for example, as an ingredient of a product bearing a "sugar free" claim is confusing and misleading. One comment expressed concern that the agency is allowing ingredients containing sugars, such as fruit juices, to sweeten foods that bear a "sugar free" claim. Other comments suggested that the confusion could be eliminated if the label of a "sugar free" food that has ingredients containing sugars disclose that the amount of sugar is trivial. Most of these comments preferred that the disclosure appear in the ingredient statement.

The agency has reconsidered the provision that disallows the addition of ingredients that are sugars to foods that bear a "sugar free" claim and is persuaded that it is unduly restrictive. The agency accepts the recommendation that the proposed provision be revised and that a disclosure statement be required to avoid consumer confusion about the quantity of sugar in the food. The agency believes that it is the listing of sugar or ingredients that are generally known to contain sugars that creates the confusion. Accordingly, the agency is revising new § 101.60(c)(1)(ii) to require that the food contain no ingredient that is a sugar, or that is generally understood by consumers to be a sugar, unless the listing of the ingredient in the ingredient statement be followed by an asterisk that refers to a disclosure statement appearing below the list of ingredients. The statement shall read: "adds a trivial amount of sugar," "adds a negligible amount of sugar," or "adds a dietarily insignificant amount of sugar."

iii. "No added sugar," and "unsweetened"/"no added sweeteners". In the general principles proposal (56 FR 60421 at 60437), FDA proposed in § 101.60(c)(2) to permit the use of the terms "no added sugars," "without added sugars," or "no sugars added" (revised in this final rule to state "no added sugar," "without added sugar," or "no sugar added" as discussed in the section on "Sugar Free"). The agency said, however, that to use the claim five conditions must be met: (1) No amount of sugars, as defined in proposed § 101.9(c)(6)(ii)(A) (redesignated as § 101.9(c)(6)(ii) in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**), is added during processing or

packaging; (2) the product does not contain ingredients that contain added sugars; (3) the sugars content has not been increased above the amount naturally present in the ingredients by some means such as the use of enzymes; (4) the food that it resembles and for which it substitutes normally contains added sugars; and (5) the product bears a statement that the food is not low calorie or calorie reduced (unless the food meets the requirements for a low or reduced calorie food) and directing consumers' attention to the nutrition panel for further information on sugars and calorie content.

The intent of the agency in defining these terms was to aid consumers in implementing dietary guidelines that stipulate that Americans should "consume sugars only in moderation," consistent with the definition for "sugars" that FDA is adopting in new § 101.9(c)(6)(ii) in the final rule on mandatory nutrition labeling. In implementing the guidelines, the purpose of the "no added sugar" claim is to present consumers with information that allows them to differentiate between similar foods that would normally be expected to contain added sugars, with respect to the presence or absence of added sugars. Therefore, the "no added sugar" claim is not appropriate to describe foods that do not normally contain added sugars. In such cases, proposed § 101.60(c)(3) would provide for the use of a factual statement that the food is unsweetened, or that it contains no added sweeteners in the case of a food that contains apparent substantial inherent sugar content, e.g., fruit juices, without requiring that the food meet the definition for "sugar free."

87. Some comments addressed use of the "no added sugar" terms on foods containing fruit juice as an ingredient. One comment interpreted the proposal as providing that modified juice products and juice products that function as sweeteners are not to be considered as added sugars. The comment specifically requested that FDA clarify its position on this matter. Another comment stated that the use of fruit juices as sweetening agents caused problems for diabetics and suggested that the five requirements listed in new § 101.60(c)(2) for a "no added sugar" claim should be supplemented by a sixth criterion: That a food does not contain sugars in the form of fruit juice, fruit concentrate, applesauce, or dried fruit.

The agency advises that the purpose of a "no added sugar" claim is to identify a food that differs from a similar food because it does not contain the added sugars that would normally be present in the other food. For this provision to be of practical benefit to consumers, it must preclude use of the claim on a food where the sugars that are normally added are replaced with an ingredient that contains sugars that functionally substitute for the added sugars. Thus, the agency concludes that the use of any ingredient that contains sugars, including fruit juice and modified or concentrated fruit juice, for the purpose of substituting for sugars that would normally be added to a food precludes the use of the "no added sugar" nutrient content claim. To avoid misinterpretation of the regulation on this matter, FDA is revising new § 101.60(c)(2)(i) to state: "No amount of sugars, as defined in § 101.9(c)(6)(ii), or any other ingredient that contains sugars that functionally substitute for added sugars is added during processing or packaging."

88. One comment interpreted proposed § 101.60(c)(2) to mean that a "no added sugar" claim would not be precluded on a product such as an all-fruit spread if that product does not contain sugar-sweetened ingredients.

FDA advises that to qualify for a "no added sugar" claim, the ingredients in the all-fruit spread could not include any ingredient that meets the agency's definition of "sugars" (new § 101.9(c)(6)(ii)), or any ingredient that contains sugars that functionally substitute for added sugars (e.g., fruit juice) (new § 101.60(c)(2)(i)), nor any ingredient that contains added sugars (e.g., concentrated fruit juice) (new § 101.60(c)(2)(ii)).

89. A comment recommended that foods that contain only indigenous sugars, but not including sugars present in concentrated or otherwise altered ingredients or products, be exempt from the requirement for disclaimer and referral statements. This comment stated that a statement such as "no added sugar" is less a nutrient content claim than an assurance that the sweetness characteristics of a product are not derived from added processed sugars, such as sucrose or high fructose corn syrup, and that this information is essential to diabetics that have been instructed by a physician to seek out foods that do not have added processed sugar but instead are fruit juice based.

The comment suggested that the required disclaimer indicating that a food is not "low" or "reduced" in calories may be misleading to consumers, causing unjust alarm that a juice product is high in calories and unhealthy. As an alternative to the disclaimer, the comment favored a qualifying statement for foods sweetened with concentrated juices, such as "sweetened with concentrated grape juice."

A similar comment requested that FDA exempt pure fruit juices from the provisions of proposed § 101.60(c)(2) or revise this section by deleting proposed § 101.60(c)(2)(iv) and (c)(2)(v) (i.e., the requirements that the food that the product resembles and for which it substitutes normally contains added sugars, and that the product bear a disclaimer statement that it is not low calorie or calorie reduced and that directs the consumer's attention to the nutrition panel). The comment stated that a "no added sugar" claim on fruit juices had been used for many years without consumer confusion, that it helped to increase consumer awareness of the added sugars in flavored drinks, and that products that are pure juices do not contain added sugars. The comment also stated that consumers regard the terms "no added sweeteners" and "no added sugar" as synonymous, and that they do not regard juices as low or reduced calorie products.

The agency disagrees with the fundamental position of these comments that a special allowance for the "no added sugar" claim should be made when the sugars added to a food are inherent to the ingredient through which they are added. As discussed in comment 79 in section III.B.c.ii. of this document, the agency believes that it is misleading to imply that a food that contains inherent sugars is nutritionally superior to a food that contains refined sugars. Thus, the labeling of a product sweetened with juice concentrate, though it bears a factual statement identifying the source of the sweetener, would be misleading if it included the statement "no added sugar." The agency concludes that granting the allowances that these comments seek would permit the use of "no added sugar" in a manner that is inconsistent with the purpose of this claim, i.e., to aid consumers in implementing dietary guidelines that stipulate that Americans should "consume sugars only in moderation." Thus, FDA is not making any changes in response to these comments.

90. One comment expressed concern that the addition of concentrated juice to unconcentrated apple juice for the purpose of achieving uniformity in the finished juice may preclude the use of the term "no sugar added."

The agency advises that the addition of a concentrate of the same juice to achieve uniformity would not, in itself, preclude the use of a "no sugar added" claim, provided, the other conditions for the claim are met. (See also the document on ingredient labeling

published elsewhere in this issue of the Federal Register.) If a concentrate of another juice were added for the purpose of increasing the sugar content of the finished juice, the product could not bear a "no sugar added" claim.

91. One comment sought assurance that fruit juice from concentrate that has been reconstituted to normal strength would be able to make a "no sugar added" claim.

The agency advises that the addition of water to a juice concentrate to produce a single strength juice would not preclude the use of a "no added sugar" claim; however, the other conditions for the claim must still be met.

92. Several comments requested confirmation that fruits packed in fruit juice would be able to make a "no sugar added" claim under the provisions of proposed § 101.60(c)(2). One of the comments stated that the Brix of the juice would not be above that of the fruit itself, and another noted that no refined sugars would be used in the product but only fruit juices or concentrated fruit juice.

The agency concludes that juice-packed fruits that contain juice with the same sugars content as the single strength juice of the fruit would qualify for a "no sugar added" claim, provided that the other conditions for the claim are met. This food meets the criteria for the claim in § 101.60(c)(2). If these same fruits were packed in syrup or in juice concentrate, they would not qualify for this claim under § 101.60(c)(2)(ii) because syrup and juice concentrate are ingredients that contain added sugars.

93. One comment stated that if enzymes are used primarily for flavor or texture development, or for reasons other than to intentionally alter the sugars content of a product, then the food should be permitted to bear a "no sugar added" claim. The comment maintained that although such enzymatic processes may result in a slight increase in the sugar content of the product, the increase would not necessarily alter the sweetness profile of the product. The comment expressed the view that the agency's limitation in proposed § 101.60(c)(2)(iii) for "no sugar added" for such foods is overly restrictive and not in the best interest of consumers.

The agency agrees that proposed § 101.60(c)(2)(iii) should not preclude the use of enzymes or other processes where the intended functional effect of the process is not to increase the sugars content of a food, even though an increase in sugars that is functionally insignificant does occur. FDA concludes that such a prohibition would be overly restrictive and without benefit to consumers seeking to moderate their sugars intake because any increase in the sugars content of a food from such processes would be of little, if any, consequence in the total diet. Accordingly, FDA has revised new § 101.60(c)(2)(iii) in the final rule to state:

> The sugars content has not been increased above the amount naturally present in the ingredients by some means such as the use of enzymes, except where the intended functional effect of the process is not to increase the sugars content of a food, and a functionally insignificant increase in sugars results.

iv. Calorie free. 94. The agency received a few comments on the term "calorie free." These comments supported the proposed definition of less than 5 calories per serving. One comment preferred that the definition be less than 2.5 calories but did not object to the proposed definition.

Based on these comments, the agency concludes that no change in the definition of "calorie free" is necessary.

95. One comment requested that soda water not be used as an example of a "calorie free" food because some consumers may conclude that all diet soft drinks are "calorie free" foods.

To avoid confusion, the agency is revising new § 101.60(b)(1)(ii) to read: (e.g., "cider vinegar, a calorie free food").

v. Fat free. 96. Most of the comments on the definition of the term "fat free" supported the proposed definition of less than 0.5 g of fat per serving. A few comments disagreed with less than 0.5 g. Some of these comments stated that "fat free" should be zero fat, while at least one comment suggested that the definition should be 0.5 g or less of fat.

The agency points out that zero fat is not an option as a limit because it is analytically impossible to measure. The proposed definition of less than 0.5 g of fat is appropriate because it is the reliable limit of detection of fat in all types of foods, and thus analytically it equates to zero. Furthermore, 0.5 g of fat is low enough compared to the DRV for fat, which the agency is establishing at 65 g (§ 101.9(c)(9)), to be considered dietarily and physiologically insignificant. For example, a person consuming 10 servings per day of "fat free" foods would consume less than 5 g of fat from these sources.

The agency is not including 0.5 g in the definition because the comment that suggested this change provided no compelling reason for it. Less than 0.5 g of fat is consistent with the way "free" terms have been defined by FDA in the past and with the way the agency is defining other "free" terms in this final regulation. Accordingly, the agency has not revised this definition.

97. At least one comment suggested that "fat free" be defined in terms of the fat content per serving and per 100 g of the food. The comment noted that the density criterion would prevent foods with small serving sizes, such as crackers, from making a "fat free" claim.

The agency is not persuaded that a second criterion based on the amount of fat per 100 g is necessary for the definition of "fat free." The first criterion of less than 0.5 g of fat requires that the food contain such a trivial level of fat that even frequent consumption of foods that bear a "fat free" claim would not affect in any meaningful way the overall fat level in the diet. Accordingly, the agency has not revised the definition of "fat free." This conclusion applies equally to all of the "free" claims that are being defined.

98. A few comments recommended that "fat free" be defined solely on the basis of less than 0.5 g per 100 g.

FDA considered this approach of defining nutrient content claims solely on the amount of a nutrient in a specified weight of food. This approach has the advantage of presenting a nutrient content claim for a food in a way that is more consistent with labeling used internationally. In addition, it allows consumers a means to more readily compare very dissimilar foods. However, FDA does not believe that this approach alone is appropriate for defining nutrient content claims. Foods are consumed in various amounts depending upon their nature and use in the diet. The agency believes that nutrient content claims could be misleading and not useful to consumers when expressed solely in terms of 100 g of food because this approach does not reflect amounts customarily consumed for all foods. For this reason, FDA did not take this approach in defining the term "fat free." Accordingly, the agency is not revising the definition of "fat free" in this manner.

99. Several comments objected to the provision in proposed § 101.62(b)(1)(ii) that a food containing added fat cannot be called "fat free," even though it still contains less than 0.5 g of fat per serving. One comment stated that "the agency should not speak of good faith or bad; it is simply a matter of definition and materiality." It contended that whether the fat is inherent or added should not be relevant as long as the amount present is less than 0.5 g. Comments stated that this provision would deprive consumers of the benefit of many innovative, nutritious products and argued that it would discriminate

against foods in certain categories based on dietarily insignificant amounts of fat. For example, less than 0.5 g of fat is added to some salad dressings that would otherwise meet the definition of "fat free." Furthermore, one comment noted that the proposed rule may be difficult to enforce since fat that is inherent cannot be distinguished from added fat.

Alternatively, many comments supported the proposal. They agreed that the listing of soybean oil, for example, as an ingredient of products bearing "fat free" claims is confusing and misleading. One comment said that "fat free" is a misnomer if fat has been added to the food. A few of these comments believed that even the addition of ingredients containing fat, such as nuts, should be disallowed. Other comments suggested that the confusion could be eliminated if the label of products containing any ingredient that contains fat were required to bear a disclosure statement, such as, "soybean oil (trivial source of fat)." Most of these comments preferred that the disclosure appear in the ingredient statement.

The agency has reconsidered the provision that disallows the addition of fat to foods that bear the claim "fat free" and is persuaded that it is unduly restrictive. The agency has decided to revise new § 101.62(b)(1)(ii) in the same way that is has revised § 101.60(c)(1)(ii) on "sugar free" claims and § 101.61(b)(1)(ii) on "sodium free" claims because the same considerations apply with respect to each of these claims. The agency believes that it is the listing of fats or ingredients that are generally understood by consumers to contain fat (i.e., nuts) in the ingredient statement that creates the confusion, and that a disclosure statement about the amount of fat in the food will eliminate that confusion. Accordingly, the agency is revising new § 101.62(b)(1)(ii) in the final rule to require that the listing of fats or ingredients that are understood to contain fat in the ingredient statement be followed by an asterisk that refers to a disclosure statement appearing below the list of ingredients. The statement shall read: "adds a trivial amount of fat," "adds a negligible amount of fat," or "adds a dietarily insignificant amount of fat."

vi. "Percent fat free" claims. FDA proposed several provisions in the fat/cholesterol proposal (56 FR 60478) regulating the use of "percent fat free" claims to ensure that the consumer is not misled by these claims, and that, as the claim implies, the food does in fact contain only a small amount of fat. Specifically, FDA proposed in § 101.62(b)(6)(i) to require that "percent fat free" claims can only be made: (1) For "low fat" foods (i.e., foods containing 3 g or less of fat per serving and per 100 g of food) or (2) for "low fat" meal-type products (i.e., meal-type products containing 3 g or less of fat per 100 g of product).

The agency also proposed in § 101.62(b)(6)(ii) to require that a disclosure statement of the amount of total fat in a serving of food appear in immediate proximity to the most prominent "percent fat free" claim, and that such disclosure statement be in type no less than one-half the size of the type of the "percent fat free" claim. In § 101.62(b)(6)(iii), FDA proposed that the type size of all the components of the "percent fat free" claim must be uniform.

Finally, FDA proposed in § 101.62(b)(iv) that a "100 percent fat free" claim must meet all of the criteria for "fat free" claims (i.e., foods containing less than 0.5 g of fat per serving and not containing any added ingredient that is a fat or oil). Furthermore, the agency advised that if the food is inherently free of fat, the label will disclose that fat is not usually present in the food (e.g., "a 100 percent fat free food").

The agency specifically requested comments as to whether the proposed requirements were sufficient to prevent "percent fat free" claims from being misleading, or whether such claims should be prohibited entirely.

100. Although the majority of comments supported the proposal to permit "percent fat free" claims on low fat foods, several comments opposed permitting the use of this claim. The primary reason cited in these comments was that this claim is misleading and confusing to consumers. One comment further stated that if FDA allowed "percent fat free" claims, it should only allow them on foods that meet the definition of "fat free." Another comment suggested that such claims be restricted to meat and poultry products, because they help to identify leanness.

The agency acknowledges that under current regulations, the use of a "percent fat free" claim has the potential to be misleading and confusing to consumers, especially when this claim appears on foods that derive a high percentage of their calories from fat. However, the agency concludes that with implementation of the provisions of this final rule regulating the appropriate use of a "percent fat free" claim (i.e., being restricted to use on products that meet "low fat" definitions), the claim will not be misleading or confusing. Furthermore, the comments that requested that the use of this term be prohibited did not provide evidence to persuade the agency that the requirements, as proposed, were insufficient to prevent misleading claims on food labels. In addition, FDA advises that the purpose of a "percent fat free" claim on nonmeat products does not relate to leanness but to information regarding the total amount of fat present in a serving of the food.

Further, the agency believes that to allow "percent fat free" claims only on "fat free" foods would be unduly restrictive. Such claims on foods that are "low" in fat, can, if properly made, be useful in assisting consumers to maintain healthy dietary practices. Consequently, the agency is denying these requests to prohibit or restrict the "percent fat free" claim.

101. One comment stated that "percent fat free" claims on bakery products may encourage consumers to purchase such products because they are low in fat, but the comment noted with concern that bakery products are high in calories, sugar, or sodium.

The agency recognizes that certain low fat foods may contain varying amounts of calories, sugar, or sodium. However, the agency does not expect a single claim (e.g., "97 percent fat free") to provide information regarding all of the nutrients contained in a product. Information on calories, sugar, and sodium will be provided in nutrition labeling, and therefore, available to the consumer at the time he or she makes a purchase decision. Moreover, if the nutrient levels in the food exceed levels at which a disclosure statement is required, a disclosure statement must appear in close proximity to the claim.

102. A comment from a foreign government opposed permitting "percent fat free" claims. The comment stated that its laws did not permit such terms to be used because they are potentially misleading. The comment suggested that FDA should not allow such claims on products.

As discussed in the previous comment, the agency recognizes that a "percent fat free" claim under regulations currently in effect can be misleading and confusing to the consumer. However, the provisions that the agency is establishing in new § 101.62(b)(6) regulating the use of a "percent fat free" claim address the aspects of such claims currently in use that have the potential to make them confusing or misleading. Thus, the agency concludes that in light of the action that it is taking, it is not necessary to ban these claims.

103. Other comments suggested that the "percent fat free" claim should be based on the amount of total calories contributed by the fat and not on the weight of the product, because basing the claim on the weight of the product has the potential to be misleading.

The agency disagrees with the comment. FDA believes that consumers are most familiar with claims expressed in terms of g per serving, and not claims based on the percentage of calories contributed by fat. FDA further believes, as stated in the fat/cholesterol proposal, that "percent fat free" claims imply that the food contains very small amounts of fat (i.e., "low" fat), and that the food is useful in structuring a diet that is low in fat. Basing the "percent fat free" claim on a designated percentage of total calories from fat would not limit the total amount of fat present in the food. Thus, a food high in calories may be able to make a "percent fat free" claim under a calorie criterion, because the percentage of total calories contributed by the fat falls within an established guideline. Yet, the amount of fat in such foods could exceed the amount that is defined as "low" fat. On such a food, the "percent fat free" claim would be misleading. Accordingly, the agency is not permitting "percent fat free" claims to be based on the percentage of calories contributed by fat.

104. Some comments requested that the agency require disclosure of the percent of calories from fat and the amount of available calories (i.e., total calories minus calories attributed to dietary fiber).

The comments requesting disclosure statements of percent calories from fat and available calories did not provide evidence on which the agency could make a finding that such disclosures were necessary to prevent a "percent fat free" claim from being misleading. Therefore, the agency finds no basis for requiring those disclosure statements. Furthermore, the agency believes that disclosure statements based on percent of calories would confuse consumers when all other disclosure statements are based on amount of g per serving. Therefore, the agency is denying the request for these disclosure statements.

105. The comments on the proposed requirement of a disclosure statement in immediate proximity to the "percent fat free" claim which specified the amount of fat in the product were equally divided in support of and against the provision. Some comments opposing the disclosure statement argued that the disclosure statement was unnecessary because the food must meet the definition of "low fat" before a "percent fat free" claim can be made. The comments also pointed out that a referral statement will direct the consumer to the nutrition label where fat is declared.

The agency recognizes that the "percent fat free" claim may not be made on the label or labeling of a product unless the food bearing the claim is "low in fat." This fact ensures that foods bearing a "percent fat free" claim will not contribute excessive amount of fat to the total diet. Thus, upon reconsideration, FDA does not find it necessary to require that foods bearing a "percent fat free" claim also disclose the amount of total fat per serving adjacent to the claim. Further, as one comment pointed out, the "percent fat free" claim will have to be accompanied by a statement referring consumers to the nutrition label, and that the total amount of fat in the product will be provided there. In addition, as discussed in response comment 214, FDA has concluded that it is not necessary to include absolute amounts in the principal display panel. Therefore, the agency is persuaded by the comments that these requirements obviate the need for a statement, adjacent to the claim, which discloses the amount of fat per serving in the product bearing such a "percent fat free" claim, and the agency is deleting this requirement in the final rule.

106. Two comments that supported the "no percent fat free" claim stated that the 3 g limitation was too restrictive and should be raised to 4 g. A third comment supporting the "percent fat free" claim stated that the only criterion should be 3 g or less per serving and that there should not be a second criterion of 3 g or less per 100 g.

As discussed in the fat/cholesterol proposal (56 FR 60478 at 60491), a "percent fat free" claim emphasizes how close the food is to being free of fat. The agency believes that this claim implies, and consumers expect, that products bearing "percent fat free" claims contain relatively small amounts of fat and consequently are useful in maintaining a diet low in fat. Thus, the agency finds that the appropriate approach to defining a "percent fat free" claim is that it be based on the definition of "low fat." Having said this, the agency points out that these comments raise objections to the definition for "low fat." The agency's decision on the final definition of "low fat" is discussed elsewhere in this document.

107. A few of the comments supporting the provision that "100 percent fat free" claims appear only on "fat free" foods, requested that "100 percent fat free" claims should also be allowed on foods to which fat has been added, as long as the food still complies with the "fat free" definition.

Although the agency has reconsidered its definition of "fat free" to allow foods with added fat that meet the definition of "fat free" to make a "fat free" claim, the agency has not been persuaded that a "100 percent fat free" claim should appear on foods with added fat. The agency believes that a "100 percent fat free" claim places more emphasis on the complete absence of fat in the food, and therefore the food should not have added fat. Thus, the agency is not permitting a food with added fat to make a "100 percent fat free" claim.

108. One comment objected to all "percent fat free" claims under the proposal. This comment stated that a "100 percent fat free" claim can be made on a food that contains 0.4 g of fat per serving and 3 g of fat per 100 g if the fat is not added, e.g., crackers with no added fat that contain 0.4 g per serving. However, if the crackers had the same amount of fat but as added fat, the claim would have to say "97 percent fat free." The comment asserted that such inconsistencies would be misleading and confusing to the consumer. Further, another comment objected to the provision that allows some foods to claim "100 percent fat free" when in fact they contain more than 0.5 g of fat per 100 g of the food and are, therefore, not 100 percent fat free. This comment stated that proposed § 101.62(b)(6)(iv) only requires that a food bearing this claim contain less than 0.5 g of fat per serving. Thus, a food with a serving size of 20 g, for example, could contain 2.45 g of fat per 100 g of the food.

The agency agrees with the latter comment. The agency did not intend to allow foods containing 0.5 g or more of fat per 100 g to bear the claim "100 percent fat free." Accordingly, the agency is revising the final rule in new § 101.62(b)(6)(iii) to require that a "100 percent fat free" claim can be made only on foods that meet the criteria for "fat free," that contain less than 0.5 g of fat per 100 g, and that contain no added fat. This revision also addresses the problem raised in the first comment. Furthermore, the agency advises that in declaring other "percent fat free" claims, the claim must accurately reflect the amount of fat present in 100 g of the food. For example, if a food contains 2.5 g of fat per 50 g then the claim should be "95 percent fat free."

109. A few comments suggested that the "percent fat free" claim be defined separately from, and not include, the "low fat" criteria because the "low fat" definition is unduly restrictive and does

not adequately differentiate the two claims. The comments further suggested that "percent fat free" claims for foods that are between 90 and 100 percent fat free be allowed. They contended that setting a threshold level of 97 percent fat free (3 g or less per 100 g) discourages consumers from eating products that are fairly low in fat but do not conform to the proposed definition for "low" and therefore gives the impression that FDA is making good food/bad food distinctions.

As stated in response to comment 106 of this document, a "percent fat free" claim is properly viewed as a "low fat" claim because it emphasizes how close the food is to being free of fat. Furthermore, basing the "percent fat free" claim on the criteria required for "low fat" products provides the consumer with a consistent method of comparison with respect to "low fat," "fat free," and "percent fat free" claims such that accurate comparisons can be made among different products. To establish separate criteria for a "percent fat free" claim could cause confusing and misleading information to be disseminated to the consumer and, thus, be contrary to the purpose of the nutrient content claims provisions of the act.

The agency also rejects the comments proposing that claims of up to "90 percent fat free" be allowed. The agency believes that such a definition would not be consistent with consumers' expectations of the fat content of foods bearing this claim because it would allow "percent fat free" claims on foods with significantly greater amounts of fat than "low fat" foods.

Furthermore, the agency is not convinced by the comments or other available information that if FDA does not permit a "90 percent fat free" claim, consumers would be discouraged from purchasing products that are "fairly" low in fat (less than 10 g per 100 g) but that do not meet the definition for "low fat." In the absence of a "percent fat free" claim, consumers will still be able to consult the nutrition label to determine the total amount of fat contained in a product and to make purchase decisions based on this information according to their individual dietary preferences.

Although the agency does not agree that a "percent fat free" claim should be allowed for foods containing up to 10 percent fat by weight, the agency has reconsidered the basis and application of the weight-based criterion for "low fat" and "percent fat free" claims such that the weight-based criterion only applies to foods with reference amounts 30 g or less or 2 tablespoons or less (see comment 45). Further, foods with reference amounts of 30 g or less or 2 tablespoons or less may bear such claims provided that they contain 3 g or less fat per reference amount and per 50 g. Therefore, foods with small reference amounts containing 6 g or less fat per 100 g will be able to bear a "percent fat free" claim. Consequently, claims of up to "94 percent fat free" will be allowed on these products that also meet the criteria for "low fat." In addition, foods with reference amounts greater than 30 g or greater than 2 tablespoons that meet the "low fat" definition may bear "percent fat free" claims. The agency believes that permitting such claims is consistent with dietary guidelines for reducing fat intake, because it would allow such claims on a wider variety of foods for which increased consumption is recommended in national dietary guidance. This issue is fully discussed in section III.A.1.b. of this document.

110. One comment suggested that the "percent fat free" claim be allowed on products containing 5 g or less fat per 100 g. Another comment suggested that the "percent fat free" claim be allowed on products containing 5 g or less fat per serving and per 100 g; no more than 30 percent of calories from fat; and no more that 10 percent of calories from saturated fat. The comment asserted that these three criteria would ensure that a "percent fat free" claim is not misleading, yet be less restrictive than the provisions proposed in the fat/cholesterol proposal.

Another comment proposed that the definition for "percent fat free" claims be based on either: (1) The food being "low fat," where low fat is 4 g or less per serving and being at least 90 percent fat free, or (2) the product being 90 percent fat free but providing no more than 4 g of fat per serving; the label disclose the number of g of fat per serving in conjunction with the "percent fat free" claim; and the product be at least 2 g of fat per serving less than the weighted average fat level of other similar products. The comment asserted that these criteria would provide an effective and less restrictive means of drawing consumers' attention to a reduced-fat content food, while allowing the consumer more reduced-fat products from which to choose.

The agency considered the alternative criteria for "percent fat free" claims as suggested in these comments. The suggested approaches establish differences between the "low fat" and "percent fat free" claims that the agency believes are inappropriate. As explained in comment 106 of this document, consumers expect a product with a "percent fat free" claim to be low in fat, and the comments did not present evidence to FDA to demonstrate to the contrary. Consequently, the most logical approach for defining a "percent fat free" claim is to choose criteria that make the claim consistent with the definition of "low fat" or "fat free." Thus, the agency rejects the alternative approaches recommended in the comments. Furthermore, the comments suggested alternatives that require comparison of amounts of fat among different products. This approach is more consistent with the criteria used for comparative claims such as "reduced" or "less" and is not appropriate for nutrient content claims such as "percent fat free." Further, in addition to not being consistent with the definitions for "low fat" or "fat free," the suggested alternatives are based on extremely complex definitions that could result in consumer confusion concerning the meanings of the terms "low fat," "fat free," and "percent fat free."

vii. Saturated fat free. 111. A number of comments strongly recommended that FDA define the term "saturated fat free" and terms that would be synonyms for "saturated fat free." These comments argued that a "free" claim is one of the most powerful claims, and that saturated fat is one of the more important nutrients from a public health perspective. They stated that this claim would be extremely useful because the foods that would qualify are the foods that consumers are being encouraged to eat more frequently. Furthermore, the availability of this claim would provide an incentive for the development of new foods that are "saturated fat free."

Some of the comments responded to FDA's reason for not defining this term. The agency argued that since less than 0.5 g per serving is "fat free," one-third of this amount, or 0.17 g per serving, would be the appropriate definition for "saturated fat free." The agency did not propose a definition because it concluded that saturated fat could not be accurately measured at this level. The comments did not dispute this point, but they argued it is appropriate to define "saturated fat free" as less than 0.5 g of saturated fat per serving based on the same criteria used for "fat free" claims, i.e., dietary insignificance and reliable detection.

One of these comments contended that a food that is "fat free" logically must be free of saturated fat because saturated fat is included in the definition of total fat. Other comments suggested that the definition be less than 0.25 g per serving on the basis of dietary insignificance. These comments did not discuss problems with

detection, except for one comment that stated that it should not be difficult to reliably detect saturated fat at 0.25 g per serving. This comment pointed out that in the proposed rule on mandatory nutrition labeling (56 FR 60366) less than 0.25 g of saturated fat per serving is the level that can be declared as "0." Another comment noted that consumers would likely be confused if foods declaring "0" g of saturated fat in the nutrition label bear the claim "low in saturated fat" instead of "saturated fat free."

The agency is persuaded by the comments that the term "saturated fat free" would be useful to individuals trying to reduce their intake of saturated fat. It is defining this term as less than 0.5 g of saturated fat per serving because the majority of the comments on this proposed rule and on the proposed rule on mandatory nutrition labeling (56 FR 60366) that addressed this issue stated that a lower value cannot be reliably detected. FDA has been convinced by these comments, which showed that less than 0.5 g of saturated fat is the reliable limit of detection of saturated fat in all types of foods, and thus analytically it equates to zero.

The agency notes that it is aware of the concerns that trans fatty acids, which are unsaturated fatty acids, may raise serum cholesterol and has requested data on this issue. A review of the information submitted and of the published literature shows that the evidence that suggests that trans fatty acids raise serum cholesterol remains inconclusive, as fully discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**. However, because of the uncertainty regarding this issue, the fact that consumers would expect a food bearing a "saturated fat free" claim to be free of saturated fat and other components that significantly raise serum cholesterol, and the potential importance of a saturated fat free claim, the agency believes that it would be misleading for products that contain measurable amounts of trans fatty acids to bear a "saturated fat free" claim. Thus, the agency is including a limit on trans fatty acids of 1 percent of the total fat in the definition of "saturated fat free" because the analytical techniques for measuring trans fatty acids below that level are not reliable. Accordingly, the agency is providing in new § 101.62(c)(1)(i) that the term "saturated fat free" ("free of saturated fat," "no saturated fat," "without saturated fat," "zero saturated fat," "trivial source of saturated fat," "negligible source of saturated fat" or "dietarily insignificant source of saturated fat") may be used on the label of a food if the food contains less than 0.5 g of saturated fat per serving and 1 percent or less of total fat as trans fatty acids.

Consistent with the requirements for other "free" claims, the agency is requiring in new § 101.62(c)(1)(ii) that the listing of ingredients generally understood by consumers to contain saturated fat must be accompanied by a statement such as "adds a trivial amount of saturated fat." Also, the agency is requiring in new § 101.62(c)(1)(iii) that foods meeting the definition without special processing must be labeled in a manner that makes this clear.

To accommodate this insertion, proposed § 101.62(c)(1) through (c)(3) is being redesignated as § 101.62(c)(2) through (c)(4), respectively. It should be noted that proposed § 101.62(c) required that all foods bearing claims about saturated fat should disclose the amount of total fat and cholesterol in the food in immediate proximity to such claims. As discussed in response to comment 138 of this document, the provision on the disclosure of cholesterol with these claims is required by section 403(r)(2)(A)(iv) of the act. Because FDA is now defining the term "saturated fat free," the provision on the disclosure of total fat is revised to require the disclosure of total fat with a "saturated fat free" claim unless the food contains less than 0.5 g of total fat per reference amount (i.e., unless the food meets the definition of "fat free"), in which case the amount of total fat need not be disclosed. The agency concludes that disclosure of the amount of total fat is necessary when a "saturated fat free" claim is made for a food that is not "fat free" to prevent consumers who do not differentiate between a "saturated fat free" and "fat free" claim from being misled by a "saturated fat free" claim (see comment 139 of this document for related discussion).

112. One comment requested that FDA define the term "very low saturated fat" as less than 0.5 g per serving. This comment stated that "saturated fat free" should be defined as less than 0.25 g per serving. Other comments requested that FDA define "very low" claims for other nutrients.

The agency rejects this request because it concludes that "saturated fat free" should be defined as less than 0.5 g per serving, as explained in the previous comment. Defining the term "very low saturated fat" is unnecessary because the proposed value for "low saturated fat" is only double the value for "saturated fat free." Furthermore, the agency is not defining any new "very low" terms because it believes that consumers would be confused by these terms in addition to the "free" terms. The term "very low sodium" is being retained because it has been in use for a number of years and is defined as 35 mg or less of sodium per serving, which is 7 times the cutoff level for "sodium free" and one-quarter of the cutoff level for "low sodium." Accordingly, the agency is not defining "very low saturated fat."

viii. Cholesterol free. 113. Most of the comments on the definition of the term "cholesterol free" supported the definition in proposed § 101.62(d)(1) of less than 2 mg of cholesterol per serving. A few comments disagreed. Some of the latter comments stated that a "cholesterol free" claim is misleading if the food contains any cholesterol. One of these comments suggested that a "cholesterol free" claim be accompanied by the statement, "this product may contain up to 2 mg of cholesterol." Other comments stated that "cholesterol free" should be less than 5 mg per serving, so that nonfat dairy products can make this claim. One of these comments said that changing the requirement to 5 mg or less would be an incentive to food manufacturers to reformulate products so as to make this claim. Another comment said that FDA has failed to establish that 5 mg of cholesterol would not also be dietarily insignificant.

The agency is not persuaded that the proposed value of less than 2 mg of cholesterol per serving should be changed or needs to be defined on the label. The agency selected this value because it represents the typical limit of reliable detection for existing analytical methods. A value of zero is not an option because it is analytically impossible to measure. Furthermore, 2 mg per serving is low enough compared to the DRV for cholesterol, which is 300 mg, to be considered dietarily and physiologically insignificant. As discussed in the tentative final rule on cholesterol terms of July 19, 1990 (55 FR 29456 at 29460), FDA believes that a limitation of 5 mg for the term "cholesterol free" is misleading. A person who consumes foods labeled as "cholesterol free" would expect that they would not contribute significantly to the cholesterol levels of his or her diet. Yet the consumption of 5 to 10 foods per day containing up to 5 mg of cholesterol per serving could furnish 25 to 50 mg of dietary cholesterol. This amount of cholesterol cannot be considered to be insubstantial. Moreover, the analytical limits on detecting cholesterol support a lower limit than 5 mg. Accordingly, the

agency has not revised the definition of "cholesterol free."

114. A couple of comments said that consumers are confused when they see ingredients containing cholesterol in the ingredient statement of foods bearing "cholesterol free" claims.

The agency agrees that consumers may be confused by reading that eggs, for example, are listed as an ingredient of a food bearing a "no cholesterol" claim. The agency has reviewed these comments with the many comments on fat being added to foods labeled as "fat free." The agency has been persuaded by these comments that a clarification of this issue is needed to avoid consumer confusion. The agency believes that it is the listing of ingredients, such as eggs, that creates the confusion. Accordingly, the agency is revising § 101.62(d)(1)(i)(B) and (ii)(B) in the final rule to require that the listing of ingredients that are generally understood by consumers to contain cholesterol be followed by an asterisk that refers to a disclosure statement appearing below the list of ingredients. The statement shall read: "adds a trivial amount of cholesterol," "adds a negligible amount of cholesterol," or "adds a dietarily insignificant amount of cholesterol." The agency points out that because of these inserted sections, proposed § 101.62(d)(1)(i)(B) and (d)(1)(i)(C) are redesignated as § 101.62(d)(1)(i)(C) and (d)(1)(i)(D), and proposed § 101.62(d)(1)(ii)(B) through (d)(1)(ii)(E) are redesignated as § 101.62(d)(1)(ii)(C) through (d)(1)(ii)(F).

115. A few comments requested that FDA ban all cholesterol content claims. The comments argued that dietary cholesterol has an insignificant impact on blood cholesterol levels compared to saturated fat, and that the response to dietary cholesterol varies from individual to individual.

The agency is denying this request. The Surgeon General's report (Ref. 4) and the NAS report "Diet and Health, Implications for Reducing Chronic Disease Risk" (Ref. 12) considered the evidence on the effect of diet on an individual's health. One of the main conclusions from these reports is that consumption of diets high in fat, saturated fat, and cholesterol is associated with increased risk of developing certain chronic diseases. These reports recommended that Americans reduce their consumption of these substances in their diets. To help Americans achieve this goal, the 1990 amendments authorize FDA to define nutrient content claims, including those relating to cholesterol content. Accordingly, the agency is not revising the final rule to ban cholesterol claims.

116. The agency received a number of comments on the proposed saturated fat threshold (i.e., limit) that allows foods bearing "no cholesterol" claims as well as other cholesterol claims to contain only 2 g or less of saturated fat per serving. About 20 comments opposed this threshold. About half as many comments supported the proposed rule and stated that a threshold of 2 g or less of saturated fat per serving is appropriate. One comment stated that this threshold should have a second criterion of 15 percent or less of energy (calories) from saturated fat. Similarly, another comment favored a second criterion of 6 percent or less of saturated fat on a dry weight basis. The comments recommending a different threshold were almost evenly divided between a higher value and a lower value. One comment requested that the threshold apply only to "cholesterol free" and "low cholesterol" claims, not to comparative claims. Other comments stated that foods bearing cholesterol claims should contain no saturated fat.

Many of the comments opposing the threshold on saturated fat with cholesterol claims were from manufacturers of dairy products that have up to 95 percent of their cholesterol removed. These products contain more than 2 g of saturated fat per serving. The comments stated that cholesterol claims should be allowed on these products regardless of their saturated fat content. They contended that the proposed saturated fat threshold is inappropriate and unduly restrictive because the relationship of cholesterol and saturated fat has not been satisfactorily defined. A few comments against the threshold favored disclosure of saturated fat. One comment said that disclosure of saturated fat, rather than a threshold, would be more consistent with the 1990 amendments (section 403(r)(2)(A)(iii)(II) of the act). They stated that a saturated fat threshold based on section 403(r)(2)(A)(vi) of the act fails to take into account the fact that certain foods containing more than 2 g of saturated fat may contain "substantially less" cholesterol than foods for which they might substitute.

Some of the comments for a higher threshold recommended a value of 3 g or less of saturated fat per serving. The comments said that this threshold would allow nuts and peanut butter to make a "no cholesterol" claim. A few comments stated that the threshold should be 4 g or less to be consistent with the level of saturated fat above which risk is likely to increase and disclosure is required. One comment stated that consumers believe that cholesterol is found in all fats and oils. They argued that claims are needed to help consumers select foods that do not contain cholesterol, rather than foods that do contain cholesterol (e.g., margarine for butter).

Most of the comments for a lower threshold recommended 1 g or less of saturated fat per serving and 15 percent or less of calories from saturated fat, to be consistent with the definition of "low in saturated fat." One comment suggested that the first criterion be 1.5 g or less of saturated fat per serving, and another comment suggested that the second should be no more that 7 calories from saturated fat per 100 calories.

These comments were concerned that the threshold proposed would encourage a proliferation of inappropriate cholesterol claims. Also, they were concerned that consumer education efforts would be hampered by a saturated fat limit of 1 g for "low in saturated fat" claims, of 2 g for cholesterol claims, and of 4 g for disclosure of saturated fat (e.g., a product bearing a sodium claim that contains more than 4 g of saturated fat per serving must disclose: "See [appropriate panel] for information on saturated fat and other nutrients"). The comments encouraged FDA to strive for consistency along with strictness and simplicity.

The agency is not persuaded that the saturated fat threshold should be eliminated or changed. FDA finds that there is general scientific agreement on the relationship between saturated fat and cholesterol and serum cholesterol levels. In the general principles proposal (56 FR 60421 at 60426), the agency noted that under section 403(r)(2)(A)(vi) of the act, it can by regulation prohibit a nutrient content claim if the claim is misleading in light of the level of another nutrient in the food. Further, FDA stated that it has tentatively made such a finding with regard to cholesterol claims and the presence of saturated fat, as fully discussed in the fat/cholesterol proposal (56 FR 60478 at 60495). FDA pointed out that NAS's "Diet and Health" report (Ref. 12) stated that "saturated fatty acid intake is the major dietary determinant of the serum total cholesterol and low-density lipoprotein (LDL) cholesterol levels in populations and thereby of coronary heart disease risk in populations" (56 FR 60482). Furthermore, an FDA survey has found that consumers are interested in cholesterol content claims because they believe that eating foods with no or low cholesterol will have a significant effect on their blood cholesterol levels and on their chances of developing heart

disease (Ref. 16). Consequently, FDA continues to believe that to ensure that cholesterol claims do not mislead consumers it is necessary to permit their use only when the foods also contain levels of saturated fat that are below a specified threshold level. Accordingly, the agency is denying the requests to eliminate the threshold. This decision applies to "cholesterol free," "low cholesterol," and comparative cholesterol claims.

The agency does not agree that disclosure of the amount of saturated fat in proximity to a cholesterol claim is sufficient to prevent consumers from being misled. As stated above, consumers expect foods with cholesterol claims to affect blood cholesterol levels, and saturated fat is the major dietary determinant of blood cholesterol levels. These expectations are not met if disclosure of saturated fat is permitted because the saturated fat is still present. Therefore, the agency is also denying the request to allow disclosure of saturated fat instead of a threshold.

Additionally, the agency does not agree that the saturated fat threshold should be a higher value or a lower value. The rationale for the threshold level of 2 g or less of saturated fat per serving is explained in the July 19, 1990, tentative final rule (55 FR 29456 at 29458). In summary, the value is consistent with the recommendations of recent dietary guidelines (Refs. 7, 12, and 17) that saturated fat intake should be less than 10 percent of calories. The agency believes that a saturated fat level that exceeds 2 g would make a cholesterol claim misleading because consumer expectations would not be met if such a food is not consistent with the recommendations of the guidelines with respect to saturated fat. For this reason, the agency concludes that levels of 2 g or less are not misleading and finds no basis for lowering the threshold below 2 g.

A review of the composition of food shows that a reasonable number of foods qualify for cholesterol claims under the criteria that FDA is establishing. For example, a number of oils including soybean, corn, safflower, and olive oil, qualify for a "no cholesterol" claim (Ref. 6). Accordingly, the agency is denying the requests to change the threshold.

Finally, the agency is not persuaded that it is necessary for the threshold to have a second criterion. The agency proposed a second criterion of 6 percent or less saturated fat on a dry weight basis in the July 19, 1990, tentative final rule (55 FR 29456). In response to comments stating that the second criterion was unnecessary and would unfairly penalize foods that have a high moisture content, the agency proposed to eliminate this provision. The agency still agrees that this provision is unnecessary and is not persuaded by the comments herein to reverse this action.

117. At least one comment suggested that a food bearing a "cholesterol free" claim should have a 3 g limit on fat content. Another comment believed that such a food should be "fat free."

The agency disagrees with these comments because it has concluded that disclosure of fat on a food bearing a "cholesterol free" claim is preferable to a fat limit as fully discussed in response to comment 143 of this document. The agency does not find that a cholesterol claim on the label of a food containing high levels of fat is misleading when the fat amount is disclosed in proximity to the claim because total fat per se does not affect blood cholesterol levels.

118. A few comments stated that a "cholesterol free" claim is misleading on a product that contains trans fatty acids. These comments stated that consumers select foods that contain no cholesterol to lower their blood cholesterol levels and argued that trans fatty acids increase these levels.

The agency understands the concerns about trans fatty acids expressed in these comments and has requested data on this issue. However, as discussed in comment 111 of this document, a review of the information submitted and of the published literature shows that the evidence that suggests that trans fatty acids raise serum cholesterol remains inconclusive, as fully discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**. For this reason the agency believes that a "no cholesterol" claim on a food containing trans fatty acids is not misleading. Accordingly, the agency is making no change in the final rule in response to these comments. However, as explained in comment 111 of this document, the agency has included a limit for trans fatty acids as a criterion for a "saturated fat free claim," because of the implications of that claim and the particular importance of that claim.

2. Low

In the general principles and fat/cholesterol proposals (56 FR 60421 and 60478), FDA proposed to define the term "low" for total fat, saturated fat, cholesterol, sodium, and calories. The agency stated that it did not believe that the term "low" should necessarily mean that a nutrient is present in a food in an inconsequential amount, as with "free," but rather that the selection of a food bearing the term should assist consumers in assembling a prudent daily diet and in meeting overall dietary recommendations to limit the intake of certain nutrients.

FDA proposed the terms "little" or "few," "small amounts of," and "low source of" as synonyms for the term "low" and specifically requested comments on how consumers commonly understand the meaning of all these terms. The agency also asked whether the terms are in fact synonymous.

FDA also proposed that "low" claims used on foods that inherently contain low levels of a nutrient must refer to all foods of that type and not merely to the particular brand to which the labeling is attached. The agency requested comments on this provision.

a. General comments. 119. A few comments addressed the concept of using 2 percent of the DRV per serving as the starting point in defining "low" claims. These comments questioned FDA's statement that 2 percent or more of the DRV is a "measurable amount." They said that amounts under this level could be measured accurately as evidenced by the fact that less than 0.5 g of fat per serving, or less than 1 percent of the proposed DRV, is the cutoff proposed for the "fat free" claim.

The agency agrees with this comment that amounts of fat less than 2 percent of the DRV for this nutrient can be measured accurately. The agency believes that, in general, less than 0.5 g of fat per serving represents the cutoff below which fat cannot be measured accurately in all food matrices and thus was the level chosen to define "fat free" (56 FR 60484, November 27, 1991). The agency acknowledges that its discussion of a "measurable amount" being 2 percent or more of the DRV of a nutrient in a serving of a food is not clear (56 FR 60439). This terminology was taken from § 101.3(e), issued in 1977, which describes how foods are to be named, and under what circumstances the word "imitation" must precede the name of a food that has a decreased level of an essential nutrient. FDA determined that nutrients present at a level of 2 percent or more of the U.S. RDA were present in a "measurable amount" and thus were of sufficient importance to be considered in deciding whether a substitute product should be labeled as an "imitation."

In the proposed rule, the agency selected less than 2 percent as the starting point in defining "low" claims based on the precedent established in § 101.3(e) that a decrease of a nutrient in a food by this amount was not sufficiently important to the diet to justify concern. Thus, the agency

tentatively concluded that this level was appropriate to use in defining "low." In this context, the agency did not mean to imply by the words "measurable amount" that lower amounts could not be measured. Given this explanation, the agency concludes that no changes are necessary in response to these comments.

120. At least one comment requested that the definitions for the nutrient content claims "free" and "low" not overlap. For example, "low cholesterol" should be defined as 2 to 20 mg of cholesterol rather than less than 20 mg of cholesterol per serving.

The agency agrees that a "low" claim on a product that could make a "free" claim could be confusing. However, FDA concludes that it is not necessary to make these definitions mutually exclusive because it is unlikely that a "low" claim would be used on a food that is eligible to bear a "free" claim. Accordingly, the agency is denying this request. However, the agency advises manufacturers to use the most appropriate claim to avoid confusion.

121. A few comments requested that FDA define "low sugar." One comment requested that FDA define this term as 3 g or less of sugar per serving or less than or equal to 10 percent sugar for the cereal category. This comment stated that because there is such a large number of products from which to select, it is important that cereals that are low in sugar be able to communicate this fact to consumers. Of the 180 products that label sugar content, about 20 percent contain 3 g or less of sugar per serving. Also the comment stated that 3 g of sugar provide 12 calories, which is 10 percent of the calories contributed by a typical 1-ounce serving of cereal. This comment also requested that "very low sugar" be defined as one-half of the quantity for "low sugar" or 1 g or less of sugar per serving. Another comment recommended a definition of 5 g or less of sugar per serving. This comment stated that presently 20 percent of adult caloric intake is attributed to sugar. Using an arbitrary 25 percent decrease in this level, a reference diet of 2000 calories, and 20 servings per day, the comment computed a value of 5 g for the cutoff. Using the same rationale, this comment requested that "very low sugar" be defined as 3 g or less of sugar per serving.

The agency does not believe that these comments provide an acceptable basis for defining "low sugar." The fact that 20 percent of cereals may contain 3 g or less of sugar per serving is not a sufficient reason to define "low sugar" in this manner, even for cereal. Likewise, a value based on a 25 percent decrease from current intake is not a sufficient basis to define this term. To be consistent with the approach the agency has taken for other "low" definitions, a definition for a "low" level of sugar would have to relate to the total amount of the nutrient recommended for daily consumption, as discussed in the general principles proposal (56 FR 60439). However, because the available consensus documents do not provide quantitative recommendations for daily intake of sugars, FDA is not proposing a reference value for this nutrient. The agency concludes that without a reference value for sugar intake, the term "low sugar" cannot be defined. For the same reason, the agency is also not defining the term "very low sugar." Accordingly, the agency is not accepting the recommendations of this comment. The agency points out, however, that much of the information that these comments seek to convey can be communicated by use of a "reduced sugar" or "less sugar" claim made in accordance with new § 101.62(c)(4).

b. Synonyms for low. Several comments discussed synonyms for the descriptive terms "low" and "very low" that FDA defined in the general principles and fat/cholesterol proposals. The agency notes that it defined "very low" only in the context of sodium claims (i.e., "very low sodium").

122. One comment offered the term "lowest" as a synonym for "low" and suggested that it be applicable to all nutrients for which FDA is defining "low" nutrient content claims.

FDA disagrees with this comment because "lowest" is a comparative term that describes the position of a product with regard to one or more of its attributes relative to that of other products within a particular category. Therefore, FDA believes that "lowest" is not an appropriate synonym for "low," and the agency is not adopting this suggested term.

123. Two comments suggested that terms like "short" or "small" be permitted as synonyms for "low."

These comments did not provide supporting information to persuade the agency that consumers commonly understand the terms "short" or "small" to have the same meaning as "low." Therefore, FDA is not providing for the use of any of these terms as synonyms for "low" at this time. However the agency advises that interested persons may submit a synonym petition for the use of any of these terms as prescribed in § 101.69 of this final rule. The agency has, however, provided for the use of "a small amount of" as a synonym for "low."

124. One comment offered the terms "dab," "dash," "hardly," "insignificant," "minimum," "negligible," "next to nothing," "pinch," "slight," "smidgeon," "tinge," "trivial," "tiny," "touch," or "very little" as synonyms for "very low."

The agency notes that it has defined the term "very low" only for of sodium content claims and has not provided for any synonyms for this term. The comment did not provide supporting information to persuade the agency that consumers commonly understand the terms "dab," "dash," "hardly," "insignificant," "minimum," "negligible," "next to nothing," "pinch," "slight," "smidgeon," "tinge," "trivial," "tiny," "touch," or "very little" to have the same meaning as "very low." Therefore, FDA is not providing for the use of any of these terms as synonyms for "very low" at this time. However the agency advises that interested persons may submit a synonym petition for the use of any of these terms as prescribed in § 101.69 of this final rule.

c. Specific definitions. i. Low and very low sodium.

125. Some comments disagreed with the agency's proposal to retain 140 mg as the level for "low sodium, contending that the basis of the definition for this term should be consistent with that for other nutrients, which would result in "low sodium" being defined as 96 mg or less per serving, i.e., 4 percent of the DRV. One comment specifically opposed lowering the criterion to 96 mg per serving, noting that it is important to retain consistency with existing definitions. Others argued that the sodium/salt sensitive portion of the population is small in number, so that there would be little public health benefit in reducing the "low sodium" definition. Other comments generally contended that consumers are familiar with 140 mg through its widespread use in describing "low sodium" foods over the last 8 years, and that there have been no apparent problems. One comment proposed that "low sodium" claims should be allowed on foods containing 10 percent of the DRV, per serving or per 100 g. It provided no basis for this suggestion which would result in increasing the cutoff level for "low sodium" foods from 140 mg to 240 mg.

The agency has reviewed the comments and is not persuaded to change the proposed definition for "low sodium." As discussed in the general principles proposal (56 FR 60421 at 60441) and noted by some of the

comments, the descriptive terms for sodium have been in use for approximately 8 years, and the agency believes that consumers are familiar with them. In general, comments received in response to the 1989 ANPRM and at the public hearings that followed, did not indicate a need for change, and most of the comments to this rulemaking supported the existing criteria, even though it was not derived in the same manner (i.e., which would have yielded a value of 96 mg per serving) as other "low" claims.

The agency also disagrees with comments suggesting a definition for "low sodium" of 240 mg per serving. If the definition were established at this level, a person could easily exceed the DRV for sodium (e.g., if more than 10 foods are consumed per day which are "low sodium"). This result would be inconsistent with dietary recommendations and with the approach that FDA is taking in defining other terms. As discussed in the general principles proposal (56 FR 60421 at 60439), the agency believes that the selection of a food bearing the term "low" should assist consumers in assembling a prudent daily diet and in meeting overall dietary recommendations to limit certain nutrients. Therefore, the agency is retaining its criteria for "low sodium" claims.

126. Many comments agreed with the proposed definition for "very low sodium," stating that it is useful and has come to be understood by consumers. However, one comment stated that the term is not necessary.

The agency has reviewed the comments and is not persuaded to change the proposed definition for "very low sodium." "Very low sodium foods" will be useful to individuals in the population wishing to reduce their total sodium intake to a more moderate level and will be especially useful to individuals on medically restricted diets (see 56 FR 60441). In general, comments received in response to the 1989 ANPRM and at the public hearings did not indicate a need for change, and most of the comments to this rulemaking supported keeping the existing criteria. Therefore, the agency is retaining 35 mg as the eligibility level for "very low sodium" claims.

ii. Low calorie. 127. Many comments agreed with the agency's definition of "low calorie." Some comments, however, disagreed. One comment suggested that "low calorie" be defined at 4 percent of the DRV or RDI, rather than the 2 percent. One comment suggested that the maximum calorie level was too low, and that only a few products would qualify to make a "low calorie" claim.

The agency agrees with the majority of the comments that 40 calories or less is the appropriate per serving criterion for the "low calorie" definition. FDA is not persuaded by the comments or by its own review of the calorie content of foods (Ref. 18) that increasing the per serving allowance in the definition of "low calorie" is prudent if the term is to be useful to consumers attempting to control their intake of calories.

As explained in the general principles proposed rule (56 FR 60439), FDA is defining a "low" claim for a nutrient that is ubiquitous in the food supply as an amount equal to 2 percent of the DRV for the nutrient. While a DRV for calories has not been established, FDA used a reference caloric intake of 2,350 calories for reviewing the definition of "low calorie" and for establishing DRV's for other nutrients. As discussed in the RDI/DRV final rule published elsewhere is this issue of the **Federal Register**, FDA has changed the reference caloric intake to 2,000 calories. Using the general approach described above, 2 percent of 2,000 calories computes to 40 calories. Accordingly, the agency is not changing the per reference amount criterion for the definition of "low calorie."

128. One comment suggested that the definition of "low calorie" should be based on foods that can be eaten freely without adding significantly to the caloric content of the total diet.

FDA disagrees with this comment. The term "calorie free" already describes foods that can be eaten freely without adding significantly to the caloric content of the total diet. Accordingly, the agency is not defining "low calorie" in this manner.

iii. Low fat. 129. Only a few comments supported proposed § 101.62(b)(2) that defines "low fat" as 3 g or less per serving and per 100 g of the food. Most of the comments on this issue objected to the second criterion of 3 g or less per 100 g. Some of these comments suggested alternatives to the second criterion.

The second criterion for the term "low fat," as well as the second criterion for the other "low" terms, has been discussed in section III.A.1.b. of this document on the general approach to nutrient content claims. In this section, the agency is addressing the comments on the first criterion of 3 g or less per serving.

The majority of the comments recommended that "low fat" remain at 3 g or less per serving. About 20 comments requested that the cutoff be 4 g or less per serving. These comments argued that defining "low fat" in this manner could still lead to a significant reduction of fat in the total diet as well as allow more flexibility for product development. A few comments requested that the cutoff be at more than 4 g per serving.

Some of the comments that requested that the cutoff be 4 g or less presented the following rationale: A diet of 2,350 calories per day with 30 percent of calories from fat allows a maximum of 78 g of fat per day. The typical adult consumes 20 servings of food per day. These comments estimated that 13 of these servings contain fat. Dividing 78 g by 13 gives an average of 6 g of fat. Based on this reasoning, 4 g of fat would be below the average of 6 g (a 1/3 reduction) and could be considered to be "low fat."

These comments pointed out that if each of 13 servings of foods contained 4 g of fat, the total amount of fat would be only 52 g, well short of 78 g. Another comment based its calculations on 10 servings of food containing fat. It observed that if 5 of 10 fat-containing foods had 4 g, they would provide 20 g of fat in the diet. Thus, the other 5 servings could contain 11 g of fat each for a total of 75 g, which was the proposed DRV for fat. Other comments stated that 4 g or less of fat per serving is appropriate because even if all 20 servings of food a day contained 4 g of fat (i.e., less than 5 percent of the DRV), the daily total would slightly exceed the DRV.

The agency agrees with the majority of the comments that 3 g or less of fat is the appropriate per serving criterion for the "low fat" definition. FDA is not persuaded by the comments or by its own review of the fat content of foods (Ref. 19) that increasing the per serving allowance in the definition of "low fat" is necessary or prudent if the term is to be useful to consumers attempting to control their intake of fat.

As explained in the fat and cholesterol proposed rule (56 FR 60486), FDA is defining a "low" claim for a nutrient that is ubiquitous in the food supply as an amount equal to 2 percent of the DRV for the nutrient. To arrive at a definition when a nutrient is not ubiquitous, the agency proposed to increase the 2 percent amount to adjust for such a nutrient's uneven distribution in the food supply. This adjustment recognizes the practice of dietary planning in which a person consumes, in a day, a reasonable number of servings of foods labeled as "low," balanced with a number of servings of foods that do not contain the nutrient in question and a number of servings of foods that contain the nutrient at levels

above the "low" level and is still able to stay comfortably within the guidelines of the various dietary recommendations (Refs. 7, 12, and 17).

With respect to fat, current dietary guidelines recommend that a person consume a maximum of 30 percent of calories from fat, which in a diet of 2,000 calories per day would allow for consumption of a maximum of 67 g of fat per day. FDA is adopting this value rounded to 65 g as the DRV for fat. Two percent of the DRV is 1.3 g, which rounded to the nearest one-half g would be 1.5 g.

The agency is not using 1.5 g as the cutoff of a "low fat" claim, however, because fat is not ubiquitous in the food supply. Because fat is not ubiquitous but is found in more than a few food categories, FDA concludes that an appropriate upper limit for a "low fat" claim should be set at two times 2 percent of the DRV or 3 g per serving. The agency remains convinced that this amount is a reasonable definition for "low fat" because an average level of 3 g in 16 to 20 servings of food per day (balancing the number of foods that do not contain fat with those that contain higher levels of fat to yield an average of 3 g of fat per serving) would supply 48 to 60 g of fat daily, within the DRV of 65 g of total fat. An average level of 4 g in 16 to 20 servings would supply 64 to 80 g of total fat, exceeding the DRV Similarly, an average of 5 g would supply 80 to 100 g of fat. For this reason the agency concludes that 4 g or more of fat per serving is not an appropriate definition for "low fat." Accordingly, the agency is not making the suggested change.

130. Some of the comments that requested that FDA change the definition of "low fat" (proposed § 101.62(b)(2)) to 4 g or less of fat per serving also requested that FDA define "very low fat." They stated that 2 g or less of fat per serving could be considered "very low fat" if 4 g or less of fat were the definition of "low fat." One comment offered the rationale that on a per serving basis, "very low fat" should be 0.5 g to 2 percent or less of the DRV (based on 75 g of fat) for fat, and "low fat" should be 5 percent or less of the DRV.

The agency is rejecting this recommendation because it is based upon an increase in the proposed definition of "low fat," which the agency is not making as explained in the previous comment. Also, as discussed in response to comment 124 of this document, additional "very low" terms will be confusing to consumers. Accordingly, the agency is not defining "very low fat."

131. At least one comment recommended that "low fat" foods be defined only as those foods containing no more than 3 g of fat per 100 g. The reason given for this recommendation is that it would simplify the comparison of foods.

As explained in response to a similar suggestion for "fat free" claims (see comment 98 of this document), FDA does not believe that this approach alone is appropriate for the definition of nutrient content claims because it does not adequately account for the way foods are consumed.

132. A few comments objected to the agency's approach of defining "low fat" in terms of g of fat per serving (proposed § 101.62(b)(2)(i)). One comment recommended that a "low fat" food be defined as a food having no more than 30 percent of calories derived from fat. Other comments recommended limits of 25 percent and 20 percent of calories derived from fat. Similarly, another comment stated that a "very low fat" food should have no more than 10 percent of calories derived from fat.

The agency disagrees with this suggestion for several reasons. Dietary recommendations to obtain no more than 30 percent of calories from fat are aimed at the total diet, not at individual foods. The agency believes that expressing claims in terms of g per serving as the basis for all "low" nutrient content claims is preferable because this amount is absolute. The percent of calories from fat varies disproportionately with the total number of calories in a food. If the number of calories is low, the percent of calories from fat can be relatively high. For example, the percent of calories from fat for radishes is over 25 percent. Thus, they would not be considered a "low fat" food using one of the approaches suggested. In fact, radishes contain only about 0.3 g of fat per serving and qualify as a "fat free" food using FDA's approach. Consequently, FDA concludes that the requested approach can be extremely misleading, especially when applied to certain categories of foods that are consistent with recommended diets (e.g., fresh fruits and vegetables).

Furthermore, FDA recognizes that consumers are most familiar with nutrient content claims being expressed in terms of g per serving. Comments that the agency has received in response to the 1989 ANPRM and in the public hearings that followed also supported continued use of serving sizes in the definition of nutrient content claims, as did the IOM report (Ref. 14). Finally, one of the goals of nutrient content claims is to help consumers construct a diet that is consistent with dietary guidelines. Claims based on absolute per serving amounts are much easier to use in this way than claims based on percentages computed for the individual food. Accordingly, the agency is not defining "low fat" in terms of percent of calories from fat.

133. A number of comments suggested that FDA should vary the quantitative definition of "low fat" according to food category and designate as "low" those foods that are relatively low compared to other foods in the same food category. In support of this approach, the comments argued that a single criterion may cause consumers to avoid food categories in which no foods qualify for a claim, making the task of educating consumers about appropriate choices within those categories more difficult.

The agency considered this approach and is rejecting it for the reasons discussed in the general principles proposal (56 FR 60421 at 60439). In summary, the agency believes that relative claims can be used to highlight certain foods in the same food category. The use of different criteria for "low fat" foods in different food categories would make it difficult for consumers to compare products across food categories and to substitute one food for another in their diets. Furthermore, this approach would make it possible for some foods that did not qualify to use the nutrient content claim to contain less fat than foods in other categories that did qualify. FDA has received many comments asking for consistency among nutrient content claims to aid consumers in recalling and using the defined terms. In addition, the IOM report (Ref. 14) recommended such consistency. None of the comments provided any basis for why these factors should not be controlling. Accordingly, the agency will not vary the quantitative definition of "low fat" from food category to food category.

134. At least one comment suggested that foods be described as "low fat" if they contain one-third less fat than the "regular" food.

FDA disagrees with this terminology because it believes it is not appropriate. However, FDA agrees that foods with a one-third reduction in fat content compared to an appropriate reference food should be able to make a claim and is providing in new § 101.62(b)(4) that such foods may be described as "reduced fat" or "less fat." Consequently, the agency concludes that no change is warranted in response to this comment.

135. One comment suggested that a food that is "low fat" should also be

"low cholesterol," and that the descriptor should be "low fat/low cholesterol." Using the same rationale, the comment suggested that the claim "fat free/cholesterol free" be used in place of "fat free" and "cholesterol free." Another comment expressed concern about "fat free" being used to describe foods that contain high levels of cholesterol.

The agency believes that this approach is overly restrictive and is not in accord with section 403(r)(2)(B)(ii) of the act, which provides that cholesterol should be identified on the PDP (i.e., "See ———— panel for information on cholesterol and other nutrients") only at levels associated with increased risk taking into account the significance of the food in the total diet. The agency has determined that these levels for cholesterol are those exceeding 20 percent of the DRV or 60 mg of cholesterol per reference amount, per labeled serving size, or, for foods with reference amounts of 30 g or less or 2 tablespoons or less, per 50 g of food. Section 403(r)(2)(A) of the act, which makes special provisions for cholesterol, saturated fat, and fiber claims, makes no such provision for fat claims. Accordingly, the agency is making no change in response to these comments. The agency notes that it is unaware of any "fat free" foods that contain 60 mg cholesterol.

iv Low saturated fat. 136. The agency received several comments on proposed § 101.62(c)(1) which defines "low in saturated fat" as 1 g or less per serving and no more than 15 percent of calories from saturated fatty acids. Most of the comments supported the criterion of 1 g or less per serving. Other comments requested that the cutoff be a higher value. One comment stated that this claim should be defined only in terms of percent of calories from saturated fat but did not suggest a percentage. Another comment stated that it would be more appropriate to permit this claim on foods that are high in total fat and relatively low in saturated fat but did not make a specific recommendation.

The second criterion for the term "low in saturated fat" is discussed in comment 137 of this document. In this section, the agency is addressing the comments on the first criterion of 1 g or less of saturated fat per serving.

The comments recommending a cutoff of 2 g per serving stated that this value would be consistent with Canada's definition of "low in saturated fat" and with the proposed saturated fat threshold on cholesterol claims. They pointed out that FDA's rationale for the 2 g threshold is that it is consistent with current dietary recommendations that 10 percent of calories come from saturated fat. One comment complained that a cutoff of 1 g would result in canola oil being the only oil able to bear this claim. The comment said that this oil is very minor in both production and consumption in the United States. It alleged that FDA has failed to recognize the strong body of scientific evidence that consumption of polyunsaturated fat lowers blood cholesterol. The comment contended that in terms of its effect on blood cholesterol, the effect of the low saturated fat content of canola oil is negated by its polyunsaturated fat content. The comment said that it has been shown conclusively in humans that both corn oil and soybean oil are better than canola oil in lowering serum cholesterol. The comment argued that the proposed definition "is clearly discriminatory, arbitrary, and ill-serves the U.S. industry and the consumer."

Another comment, which supported a definition of 2 g or less of saturated fat per serving and no more than 15 percent of calories from saturated fat, presented data that it claimed showed that saturated fat intake both for the total population and the 90th percentile is basically identical whether the first criterion is 1 or 2 g per serving. It concluded that a cutoff of 1 g would unreasonably restrict consumer choices of foods with no dietary impact on saturated fat.

The agency has reconsidered this issue and agrees with the majority of the comments that 1 g or less is the appropriate per serving criterion for the "low in saturated fat" claim, which is the proposed value. FDA is not persuaded by the arguments or by its own review of the saturated fat content of foods (Ref. 20) that increasing the per serving allowance in the definition is necessary or prudent if the term is to be useful to consumers attempting to control their intake of saturated fat. FDA acknowledges that only a limited number of fats and oils will be able to make this claim but points out that in addition to canola oil, high oleic safflower oil, almond oil, apricot kernel oil, and hazelnut oil qualify. Also, mayonnaise type salad dressing and various types of low calorie salad dressings can make this claim. With respect to the statement that corn oil and soybean oil are better than canola oil in lowering serum cholesterol, the agency notes that this statement was not supported by data in the comment.

As explained in the fat/cholesterol proposed rule (56 FR 60486) and in the section on "low fat" in this final rule, FDA is defining "low fat" as 2 percent of the DRV for fat times two to adjust for the fat distribution in the food supply, or 3 g of fat per serving. Using the same approach for saturated fat and the recommendation of current dietary guidelines (Refs. 7, 12, and 17) that the consumption of saturated fat be less than 10 percent of calories, the agency concludes that "low in saturated fat" should be defined as 1 g or less per serving.

This conclusion reflects the fact that total fat and saturated fat have similar distributions in the food supply. An FDA analysis has determined that both total fat and saturated fat are present in over half of 18 USDA-defined food categories (Ref. 21). For the purpose of that analysis, a nutrient was considered to be "present" in a food category if over one-half of the foods in the category contained 2 percent or more of the proposed DRV. Further, the agency remains convinced that this amount is a reasonable definition for "low in saturated fat" because an average level of 1 g in 16 to 20 servings of food per day would supply 16 to 20 g of saturated fat daily, within the DRV for saturated fat of 20 g (§ 101.9(c)(9)(i)). An average level of 1.5 g in 16 to 20 servings per day would supply 24 to 30 g of saturated fat, exceeding the DRV. Similarly, an average level of 2 g would supply 32 to 40 g of saturated fat. For this reason, the agency concludes that 1.5 g or more of saturated fat per serving is not an appropriate definition for "low in saturated fat." Accordingly, the agency is denying the requests that the cutoff for the per serving criterion be increased or eliminated.

137. Some comments recommended that the second criterion in proposed § 101.62(c)(1), which defines "low in saturated fat" as 1 g or less per serving and no more than 15 percent of calories from saturated fatty acids, be eliminated, and a few comments suggested that it be changed to a lower value.

The comments that recommended that the second criterion should be eliminated said that this criterion prevents claims on some of the foods recommended by NCEP for lowering saturated fat intake. Also, one comment pointed out that when fat is reduced in a food that is relatively low in saturated fat, the percent of calories from saturated fat is increased (i.e., a food able to make this claim could be disqualified by fat removal). Other comments stated that the second criterion is not needed because manufacturers will no longer be able to manipulate serving size. Furthermore, one comment contended that there is no evidence that foods that are nutrient dense are consumed in excess. A few comments said that "percent of calories

from saturated fat" should apply to the total diet, not to individual foods, and that 15 percent is inconsistent with the guidelines. Values of 10 percent and 7 percent were recommended.

The agency is not persuaded by the comments that it should eliminate the second criterion or lower this value. The agency continues to believe that a second criterion is needed to prevent misleading "low" claims on nutrient-dense foods with small serving sizes. The second criterion in the agency's definition for "low in saturated fat" is for this purpose. A general discussion of second criteria for "low" claims may be found in section III.A.1.b. of this document.

The agency agrees with the comment that "percent of calories from saturated fat" generally should apply to the total diet, not to individual foods. For this reason, the agency did not accept the recommendation that a "low fat" food should be defined as having no more than 30 percent of calories derived from fat as discussed in response to comment 132 of this document. The agency also pointed out in comment 132 of this document that for a given level of fat, the "percent of calories from fat" varies with the total number of calories in a food, that is, this approach focuses on the relative amount of the nutrient present in the food rather than the absolute amount. If the number of calories is low, the percent of calories from fat is relatively high. The percent of calories from saturated fat can increase either by increasing the amount of saturated fat or by decreasing the amount of total calories. As one comment observed, removal of fat could make the percent of calories from saturated fat increase, conceivably disqualifying a food from making a "low in saturated fat" claim. However, as stated above, this second criterion is necessary to prevent misleading "low in saturated fat" claims. As explained in the fat and cholesterol proposed rule (56 FR 60478 at 60492), the agency selected a second criterion of no more than 15 percent of calories from saturated fat because it tentatively determined that the approach used in selecting the second criterion for the other "low" claims yielded a criterion that was too restrictive (i.e., less than 1 g of saturated fat per 100 g of food). Consequently, FDA sought a different approach and considered the criteria of other nations. FDA found merit in Canada's approach of no more that 15 percent of calories coming from saturated fat, although the agency does not agree with Canada's first criterion of 2 g or less of saturated fat per serving. While dietary recommendations are for less than 10 percent of calories in the diet being provided by saturated fat, the fact that saturated fat is not ubiquitous in the food supply would allow higher amounts in those foods that contain saturated fats to balance off those that are lower, resulting in a total daily diet that meets dietary recommendations.

An examination of food composition data (Ref. 20) reveals that a regulation that allows foods containing 1 g or less of saturated fat per serving and no more than 15 percent of calories from saturated fat to make a "low in saturated fat" claim results in a reasonable number of foods being able to make this claim. These foods include most fruit, vegetables, and grains; skim milk and other dairy foods made from skim milk; a few nondairy cream substitutes and dessert toppings; egg substitutes; mayonnaise type salad dressing, low calorie salad dressings, canola oil, and high oleic safflower oil; fish and shellfish; many cereals, breads, and soups; and some cookies and candies. However, evaporated milk, non-dairy desert toppings, and margarine spreads will not be able to make a "low in saturated fat" claim because the percent of calories from saturated fat in these foods exceeds 15 percent. "Low in saturated fat" claims on these foods would be misleading because they do not contain especially low levels of saturated fat.

The agency acknowledges that this definition prevents this claim from appearing on some of the foods that NCEP recommends be used as substitutes for other foods in achieving a lower intake of saturated fat. For example, the NCEP recommends using skim or 1 percent fat milk as a substitute for whole milk, and 1 percent fat milk will not be able to make a "low in saturated fat" claim. The agency agrees with NCEP's recommendations but does not believe that all such substitute foods, including 1 percent fat milk, are necessarily "low in saturated fat." The NCEP, in many cases, recommends selections that are "lower" in fat than the foods for which they substitue in the diet. The agency continues to believe that this claim should enable consumers to easily identify the foods that contain especially low levels of saturated fat, and that the proposed definition achieves this purpose. Accordingly, the agency is denying the request that the second criterion of no more than 15 percent of calories from saturated fat be eliminated or changed in value.

138. At least one comment requested that FDA eliminate the requirement in proposed § 101.62(c) that the amount of cholesterol be disclosed in proximity to the claim "low in saturated fat." The comment stated that disclosure of cholesterol is unwarranted because dietary cholesterol has no effect on serum cholesterol levels. Other comments supported the proposed rule with respect to disclosure of cholesterol. At least one comment stated that the cholesterol disclosure is too lenient. This comment stated that a "low in saturated fat" claim should only be allowed on foods that never contain cholesterol.

The agency points out that the provision on the disclosure of cholesterol with a "low in saturated fat" claim, as well as the other saturated fatty acid claims, is required by section 403(r)(2)(A)(iv) of the act. Accordingly, the agency is making no change in response to these comments. The effect of dietary cholesterol on serum cholesterol levels is discussed in response to comment 115 of this document requesting that all cholesterol claims be banned.

139. A few comments objected to the requirement in proposed § 101.62(c) that the amount of fat in a food be disclosed in proximity to the claim "low in saturated fat." One comment said that this provision goes beyond the demands of the 1990 amendments and is unwarranted. Another comment requested an exemption from fat disclosure for margarine. The comment said that it is unfair because disclosure is not required for butter. One comment stated that fat disclosure is only necessary for products that contain excessive fat. The comment recommended that fat disclosure be required only if the fat level exceeds 11.5 g per serving and noted that such a requirement would be consistent with the level at which fat is disclosed with cholesterol claims. Comments said that at the very least, fat disclosure should not be required at levels of 3 g or less per serving (i.e., a "low fat" food would not have to have a fat disclosure). Another comment recommended that if the fat level of a food exceeds 11.5 g per serving, the label should state, "high in fat." It said that stating the amount of fat is not meaningful to most consumers. Other comments supported the proposed rule with respect to disclosure of fat.

The agency agrees that this provision is not required in the 1990 amendments and is persuaded that fat disclosure should not be required at levels of 3 g or less per serving. The agency concludes that such disclosure is unnecessary because 3 g or less is the per serving criterion for the term "low fat." A consumer who does not differentiate between a "low in saturated fat" and "low fat" claim

would not be misled by a "low in saturated fat" claim as long as the fat level of the food is 3 g or less per serving. For uses of "low in saturated fat" on foods with more than 3 g of fat, disclosure of fat content is required to avoid misleading the consumer. For this reason, the agency is denying the requests that disclosure of fat content be required only when the fat content exceeds 11.5 g per serving. The fat content is a material fact at levels above 3g when a "low in saturated fat" claim is made.

Also, the agency is denying the request that margarine be exempt from fat disclosure. The disclosure of total fat on foods (except foods that are "low fat") that bear a "low in saturated fat" claim is necessary to ensure that consumers who do not differentiate between a "low fat" and a "low in saturated fat" claim are not misled by the latter claim. The agency notes that butter is not required to disclose fat because it does not bear a "low in saturated fat" claim.

Finally, the agency is not requiring that the label of a food with a "low in saturated fat" claim state that it is "high in fat" if it contains more than 11.5 g per serving. FDA has not defined "high in fat." In addition, 11.5 g was the proposed disclosure level. As explained in comment 13, FDA has raised the disclosure level to 13.0 g of fat. However, to require a "high in fat" statement on foods that bear a claim and contain more than that level of fat would be inconsistent with the disclosure concept in section 403(r)(2)(B) of the act.

140. At least one comment stated that the "low in saturated fat" claim is misleading on a food that contains hydrogenated oil (i.e., contains trans fatty acids).

As discussed in comment 111 and 118 of this document, the evidence suggesting that trans fatty acids raise serum cholesterol remains inconclusive. For this reason, the agency finds that it cannot conclude that a "low in saturated fat" claim on a food containing trans fatty acids is misleading. Accordingly, the agency is making no change in the final rule in response to this comment. However, as explained in comment 111 of this document, the agency has included a limit for trans fatty acids as a criterion for a "saturated fat free claim," because of the implications of that claim and the particular importance of that claim.

141. A few comments requested that "——— percent unsaturated fat" be allowed as a synonym for a claim about saturated fat. One of the comments stated that without the ability to make this claim, there is an economic incentive for manufacturers to substitute soybean oil for canola and safflower oil. They said the data do not support FDA's concern that positive claims about high fat will increase consumption.

The agency is not allowing the term "unsaturated fatty acids" to appear in the nutrition label because of uncertainty about its definition, specifically, the inclusion of trans isomers of monounsaturated fat, as discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**. Therefore, the agency concludes that it would be inappropriate to define the term "——— percent unsaturated fat," and the agency is denying this request.

v. Low cholesterol. 142. Only a few comments supported proposed § 101.62(d)(2) that defines "low cholesterol" as less than 20 mg per serving and per 100 g of the food. Most of the comments on this issue objected to the criterion based on weight, and some of these comments suggested alternatives to this criterion.

The weight-based criterion for the term "low cholesterol," as well as for the other "low" terms, has been discussed in section III.A.1.b. of this document on the general approach to nutrient content claims. In this section, the agency is addressing the comments on the criterion of less than 20 mg of cholesterol per serving.

The majority of the comments recommended that "low cholesterol" remain at 20 mg or less per serving. A few comments requested that the cutoff be a lower value, and a few other comments wanted a higher value. The comments favoring a cutoff of 15 mg pointed out that many foods consumed throughout the day have ingredients that contain cholesterol (e.g., bread). They stated that the recommended intake of less than 300 mg of cholesterol per day could easily be exceeded if these foods are eaten in sufficient quantity. One of the comments favoring a cutoff of 30 mg also believed that "cholesterol free" should be less than 5 mg per serving. The comment contended that the cutoff for "low cholesterol" should be six times the cutoff for "cholesterol free" because the cutoff for "low fat" is six times the cutoff for "fat free."

The agency agrees with the majority of the comments that 20 mg or less cholesterol is the appropriate per serving criterion for the "low cholesterol" definition. As explained in the fat/cholesterol proposed rule (56 FR 60478 at 60486), FDA considered that a "low" claim for a nutrient that is ubiquitous in the food supply should be an amount equal to 2 percent of the DRV for the nutrient. To arrive at a definition when a nutrient is not ubiquitous, the agency proposed to increase the 2 percent amount to adjust for the nutrient's uneven distribution in the food supply. If the nutrient is found at measurable levels in foods from only a few food categories, the agency proposed to define "low" as three times 2 percent of the DRV. Cholesterol, which is found only in foods of animal origin, is in this group of foods. The DRV for cholesterol is 300 mg, 2 percent of which is 6 mg. Therefore, the value for "low cholesterol" computes to 18 mg, which rounded to the nearest 5 mg increment, is 20 mg per serving.

Consequently, the agency is denying the request that the cutoff for "low cholesterol" be less than 30 mg because it concludes that this value is too high to be useful to consumers attempting to control their intake of cholesterol. Moreover, the agency disagrees with the rationale presented for 30 g that the cutoff for "low cholesterol" should be six times the cutoff for "cholesterol free" based on a value of 5 mg, because the cutoff for "low fat" is six times the cutoff for "fat free." The agency emphasizes that the "low" values are derived from the DRV's, not from the limit of detection. Also, the agency is denying the request that the cutoff for "low cholesterol" should be less than 15 mg on the basis that is too restrictive. Cholesterol is not so widespread in the food supply that such low levels are necessary to help consumers to structure their diets to be consistent with dietary guidelines for cholesterol. A "low cholesterol" claim based on 20 mg will be useful to consumers in structuring a total diet that is consistent with dietary guidelines.

Accordingly, the agency is not revising the final rule to change the amount allowed per serving for a "low cholesterol" claim.

143. The agency received relatively few comments on the requirement for disclosure of total fat with cholesterol claims. Some of the comments supported the provision of the proposed rule that the amount of fat must be declared next to a cholesterol claim if the fat content exceeds 11.5 g per serving or per 100 g of food. Other comments favored disclosure at other levels of fat, including all levels of fat, while some comments opposed disclosure of any amount of fat. One comment said that disclosure of the amount of fat would not be useful to the average consumer and suggested the statement, "this product is not low in total fat."

A few comments stated that the term "low cholesterol" on the label of a food containing high levels of fat is misleading, even if the amount of fat is disclosed. These comments recommended that cholesterol claims have a fat threshold above which claims are disallowed. One comment requested that a "low cholesterol" claim, as well as a "cholesterol free" claim, not be allowed on foods containing more than 3 g of fat and 0.15 g of fat per g of dry matter. This comment argued that a limit on total fat is needed to prevent manufacturers from meeting the saturated fat threshold by replacing saturated fat with trans fatty acids. As discussed in response to comment 117 of this document, another comment proposed a 3 g limit on fat specifically for "cholesterol free" claims but did not refer to "low cholesterol" claims. One other comment requested that a "low cholesterol" claim not be allowed on food containing more than 5 g of fat and more than 20 percent total fat on a dry weight basis.

The agency has reviewed this issue and continues to believe that fat disclosure is preferable to a fat limit above which the claim "low cholesterol," as well as other cholesterol claims, cannot be made. The agency has the authority under the act to establish a fat limit with cholesterol claims. Section 403(r)(2)(A)(vi) of the act states that a nutrient content claim "may not be made if the Secretary by regulation prohibits the claim because the claim is misleading in light of the level of another nutrient in the food." The agency has used this authority to prohibit cholesterol claims on foods containing more than 2 g of saturated fat per serving, which is discussed in response to comment 116 of this document. However, the agency does not find that a cholesterol claim on the label of a food containing high levels of fat is misleading when the fat amount is disclosed in proximity to the claim because total fat per se does not affect blood cholesterol levels. Thus, consumer expectations regarding blood cholesterol levels are met as long as the food contains the requisite amount of cholesterol and 2 g or less of saturated fat per serving.

The agency proposed that amounts of fat exceeding 11.5 g per serving or per 100 g of food have to be disclosed. The 11.5 g amount represents 15 percent of the DRV for fat. Disclosure of the amount of fat, rather than the statement, "this product is not low in total fat," is in accordance with section 403(r)(2)(A)(iii) of the act. This section states that the amount of total fat shall be disclosed in immediate proximity to a cholesterol claim if a food, taking into account its significance in the total diet, contains fat in an amount that increases the risk for persons in the general population of developing a diet-related disease or health condition.

In response to comments requesting that FDA modify the disclosure level in § 101.13(h) to 20 percent of the DRV, the agency is changing the final rule to provide that disclosure levels for fat are those exceeding 13 g of fat per reference amount, per labeled serving size, or, for foods with a reference amount of 30 g or less or 2 tablespoons or less, per 50 g of food. The rationale for this change is presented in the final rule on health claims, published elsewhere in this issue of the **Federal Register**.

144. About 15 comments opposed the provision in proposed § 101.62(d)(1)(ii)(E) and (d)(2)(ii)(E) that the amount of cholesterol in certain foods bearing "cholesterol free" or "low cholesterol" claims must be "substantially less" than the food for which it substitutes (i.e., it must meet the requirements for a comparative claim using the term "less" in proposed § 101.62(d)(5)(i)(A)). The foods included were those that contain more than 11.5 g of fat per serving or per 100 g of food and that contain, only as a result of special processing, an amount of cholesterol per serving that meets the relevant criterion for a "free" or "low" claim. The proposed requirements for comparative claims that apply are that the food contain at least 25 percent less cholesterol, with a minimum reduction of more than 20 mg cholesterol per serving, than the reference food.

The majority of the comments opposed the minimum reduction of cholesterol of more than 20 mg. One comment contended that the requirement for a minimum reduction goes beyond the requirements of section 403(r)(2)(A)(iii)(I) of the act that the level of cholesterol should be substantially less than the level usually found in the food or in a food that substitutes for the food. Many of these comments opposed this minimum because it would disallow a cholesterol claim on products such as 2 percent milk that has up to 95 percent of its cholesterol removed. These comments also opposed the proposed saturated fat threshold because the dairy products that have undergone cholesterol removal contain more than 2 g of saturated fat per serving. These comments requested that a cholesterol claim be allowed on the label of a food, regardless of the food's fat or saturated fat content, provided that the food has at least 33 percent of the indigenous cholesterol removed, and that the content of total fat is disclosed.

At least two comments supported the proposed minimum but opposed the disclosure statement (i.e., disclosure of the percent that the cholesterol was reduced, the identity of the reference food, and quantitative information comparing the level of cholesterol in the product per serving with that of the reference food). At least one comment opposed the required minimum, the 25 percent reduction, and the disclosure statement. This comment stated that the claims "cholesterol free" and "low cholesterol" should refer to an absolute level of cholesterol rather than to a relative level.

The agency is persuaded by these comments that the minimum reduction of cholesterol of more than 20 mg is unduly restrictive because it discriminates against products containing relatively small amounts of cholesterol. Accordingly, the agency is eliminating this requirement in the final rule for the "cholesterol free" and "low cholesterol" claims as well as for comparative claims (as discussed in response to comment 158 of this document). However, the agency continues to believe that "substantially less" cholesterol should be interpreted as 25 percent less cholesterol than the reference food. Twenty-five percent represents the extent of reduction necessary to make a "less" or "reduced" claim. Consequently, the agency is denying the request that the labeled food contain 33 percent less cholesterol, or that no reduction in cholesterol be required.

Furthermore, under section 403(r)(2)(A)(iii)(II) of the act, the disclosure statement must appear in immediate proximity to the claim, as proposed. FDA is providing, however, in § 101.62(d)(1)(ii)(F)(2) and (d)(2)(iii)(E)(2) in this final rule that the quantitative information comparing the level of cholesterol in the product with that of the reference food may appear on the information panel in conjunction with nutrition labeling. The agency is making this change in § 101.13(j)(2)(iv) to prevent label clutter on the PDP, as discussed in response to comment 214 of this document. The request that a cholesterol claim be allowed regardless of saturated fat content is addressed elsewhere in this document (see comment 116 of this document), as is the need for fat disclosure with cholesterol claims (see comment 143 of this document).

vi. Lean. 145. FDA received several comments that supported use of the terms "lean" and "extra lean" with FDA-regulated meat products or meal-

type products in accordance with definitions of these terms as proposed by the Food Safety and Inspection Service (FSIS). Meal-type and main dish products are defined and fully discussed elsewhere in this final rule.

One comment requested that FDA allow use of the terms "lean" and "extra lean" on the labels of fishery products in a manner similar to that proposed by FSIS. The comment noted that the composition of some fishery products would prevent them from bearing the nutrient content claim "low fat" on their labels in accordance with the definition of this term in FDA's fat/cholesterol proposal. The comment also pointed out that FDA's general principles and fat/cholesterol proposals did not provide for use of the term "lean" or "extra lean" on the labels of fish products. However, if these foods were considered under FSIS' proposed regulation, a substantial number of them would qualify for use of the term "lean" or "extra lean" on their labels.

Another comment stated that FDA should permit product lines that contain both USDA- and FDA-regulated meal-type products to bear descriptive terms such as "lean" and "extra lean" that can be applied to the entire product line for labeling and advertising purposes. The comment further stated that, if FDA does not allow the terms "lean" and "extra lean" on food products regulated by the agency, then these terms will most likely not be used on any meal-type products. The comment also stated that the USDA proposed criterion for saturated fat should be eliminated because it is too restrictive.

These comments raise an issue that FDA finds has merit. By way of background, on November 27, 1991, FSIS published a proposed rule (56 FR 60302) on nutrition labeling of meat and poultry products. In that proposal, FSIS presented definitions of the descriptive terms "lean" and "extra lean" that would only be applicable to the meat and poultry products that FSIS regulates under the authority of the Federal Meat Inspection Act (21 U.S.C. 601 et seq.) and the Poultry Products Inspection Act (21 U.S.C. 451 et seq.). FSIS proposed that the term "lean" could be used to describe a meat or poultry product that contained less than 10.5 g fat, less than 3.5 g saturated fat, and less than 94.5 mg cholesterol per 100 g. The term "extra lean" could be used to describe a meat or poultry product that contained less than 4.9 g fat, less than 1.8 g saturated fat, and less than 94.5 mg cholesterol per 100 g. FSIS also proposed to permit these terms to be used to describe multi-ingredient meal-type products.

Data supplied by the American Heart Association (AHA), in response to the April 2, 1991, FSIS ANPRM (56 FR 13564) on nutrition labeling of meat and poultry products, provided the basis for the criteria that FSIS used in its proposed definitions of these terms. These data consisted of levels for total fat, saturated fat, and cholesterol of selected fresh and processed "meat" items (various types of beef, veal, pork, lamb, poultry, and fish) on a "cooked weight" basis. Using recommended food consumption patterns and dietary guidance recommendations as bases, AHA selected threshold values for fat, saturated fat, and cholesterol levels of these muscle foods on a 1 oz and 3 oz "cooked weight" basis. Threshold values for "lean" represent approximately 7 percent fat in raw meat and 10 percent fat by weight in cooked meat. Threshold values for "extra lean" represent approximately 5 percent fat by weight.

The levels in FSIS' proposed definitions were derived by converting AHA's threshold values from a 1 oz to 100 g basis. Upon making this calculation, FSIS found that the values obtained approximated the agency's criterion for use of the terms "lean" and "extra lean" on the labels of meat and poultry products as discussed in a November 18, 1987, FSIS policy memorandum 7OB(Ref. 22).

Based on comments received in response to its nutrition labeling proposal (56 FR 60302), FSIS, in a final rule published elsewhere in this issue of the **Federal Register**, has changed the rounding rule that it originally used. In addition, FSIS has developed modified criteria for levels of total fat, saturated fat, and cholesterol such that the ratio of saturated fat to total fat would be 40 percent for both nutrient content claims. FSIS considers the ratio of 40 percent to be reasonable because it is representative of the ratio of saturated fat to total fat inherent in ruminant muscle. Although AHA's suggested criteria were based upon fresh and processed cooked meat (cut or ground), in its final rule, FSIS is adopting criteria on an "as packaged" basis to achieve consistency with that agency's past labeling policy.

Under the FSIS final rule, to bear the term "lean," a meat or poultry product must contain less than 10 g fat, less than 4 g saturated fat, and less than 95 mg cholesterol per reference amount and per 100 g. To bear the term "extra lean," the product must contain less than 5 g fat, less than 2 g saturated fat, and less than 95 mg cholesterol per reference amount and per 100 g for individual foods. The criteria in the definitions of these terms for meal-type products under the FSIS final rule are presented elsewhere in this final rule.

The comments supporting use of the terms "lean" and "extra lean" on the labels of meat products and meal-type products have persuaded FDA to include provisions in this final rule consistent with those of FSIS to provide for use of the terms "lean" and "extra lean" to describe certain comparable foods regulated by FDA under the act. In the proposal, FDA solicited comments on whether additional defined terms were needed (56 FR 60421, 60431), and these comments demonstrated that the agency needed to add terms useful for these types of foods. FDA has statutory authority to enforce the act's provisions that prohibit misbranding of all foods except for those products exempted under the act (section 902 of the act (21 U.S.C. 392)). Thus, FDA is responsible for regulation of the labeling of certain types of meat products (e.g., seafood, bison, rabbit, game meats) not regulated by USDA under the Federal Meat Inspection Act (21 U.S.C. 601–623 et seq.) or the Poultry Products Inspection Act (21 U.S.C. 451–469) or in situations in which these products are not subject to USDA regulation. In addition, FDA is responsible for regulation of meal-type products not regulated by USDA under either of the aforementioned acts.

The agency recognizes that seafood and seafood products play a comparable role in the diet to that of meat and poultry products and, like meat and poultry products, contribute to the total dietary intake of fat, saturated fat, and cholesterol. In addition, FDA-regulated meal-type products are consumed in the same manner as USDA-regulated meal-type products covered by the FSIS rule. FDA concludes that providing for use of the descriptive terms "lean" and "extra lean" as nutrient content claims on the labels of seafood (including finfish and shellfish) and meal-type products that it regulates would be of value to consumers in maintaining healthy dietary practices. The terms "lean" and "extra lean" will describe foods of these types with relatively lower levels of fat, saturated fat, and cholesterol. In addition, the agency recognizes that the same conclusion applies to other meat products regulated by FDA (e.g., bison, rabbit, game meats).

Analyses of FDA's Food Composition Data Base (Ref. 23), which is based on USDA's Agriculture Handbook Number 8 on food composition, show that many fish/shellfish products (on a raw basis with a reference amount of 110 g) would qualify to bear "lean" or "extra lean" claims under FSIS' definitions of these

terms that FDA is adopting. Haddock, swordfish, and clams, for example, could be appropriately labeled as "extra lean," while Spanish mackerel and Bluefin tuna would be eligible for use of the term "lean" on their labels. On the other hand, neither term could be used on such seafood items as shrimp, Chinook salmon, or any other seafood item with a composition that exceeds the limits on the levels of total fat, saturated fat, or cholesterol established for use of the term "lean." Similarly, for game meats and related FDA-regulated meat products (on a raw basis with a reference amount of 110 g), based on data from USDA's Agriculture Handbook Number 8 on food composition (Ref. 24), domesticated rabbit could be differentiated from deer (venison) because domesticated rabbit would qualify for "lean" and deer for "extra lean."

FDA's action in promulgating equivalent definitions of these terms will enable consumers to compare the nutritional values of meat products and meal-type products that may serve as substitutes for one another in a balanced diet. Therefore, FDA is including in this final rule § 101.62(e) that permits use of the terms "lean" and "extra lean" on individual foods and on meal and main dish products. Use of these descriptive terms for FDA-regulated meal and main dish products is addressed elsewhere in this final rule. Because the agency is including this definition in the final rule, it is redesignating proposed § 101.62(e), a provision that addresses misbranding, as § 101.62(f) in the final rule.

FDA recognizes that the definitions of "lean" and "extra lean" for meat items allow this claim to be used when cholesterol levels exceed FDA's disclosure levels for this nutrient in the food (i.e., 60 mg). The agency considered whether to prohibit these claims on FDA-regulated meat products that contain greater than 60 mg cholesterol. However, the agency concluded that it would be of benefit to consumers to permit the claim on meat products that have a cholesterol content exceeding the disclosure level because the claims identify foods relative to other foods in this broad food class that contain lower amounts of fat and saturated fat. Thus, use of these claims would assist consumers in selecting such foods in constructing a total diet. Furthermore, when the cholesterol level in the food exceeds FDA's disclosure level, § 101.13(h) requires a disclosure statement referring the consumer to the nutrition information panel for additional information about cholesterol content.

3. "High" and "source"

Section 3(b)(1)(A)(iii)(VI) of the 1990 amendments requires that the agency define the term "high." Section 403(r)(2)(A)(v) of the act states that foods bearing a "high" claim for fiber either must be "low" in fat, or their labeling must disclose the level of total fat in the food in immediate proximity to the claim with appropriate prominence. In the general principles proposal (56 FR 60443), the agency proposed definitions for "high" and for "source," terms that may be used to emphasize the presence of a nutrient.

The agency proposed in § 101.54(a) to exclude total carbohydrate and unsaturated fatty acids from coverage under the proposed definition for "high" and "source." The agency explained that a nutrient content claim for these nutrients would be misleading.

The agency proposed in § 101.54(b)(1) that the terms "high," "rich in," or "major source of" may be used to describe the level of a nutrient in a food (except meal-type products) when a serving of the food contains 20 percent or more of the proposed RDI or the proposed DRV for that nutrient. The agency also proposed in § 101.54(c)(1) that the terms "source," "good source of," or "important source of" may be used to describe a food when a serving of the food contains 10 to 19 percent of the proposed RDI or the proposed DRV.

The agency also proposed in § 101.54(d) that if a nutrient content claim is made with respect to the level of dietary fiber, that is, that the product is "high" in fiber, a "source" of fiber, or that the food contains "more" fiber, and the food is not low in total fat as defined in proposed § 101.62(b)(2), then the label must disclose the level of total fat per labeled serving in immediate proximity to the claim and preceding the referral statement required in § 101.13.

The agency requested comments concerning its approach of limiting the number of descriptors that emphasize the presence of a nutrient to two levels. The agency explained that it took this approach to assist consumer understanding of, and confidence in, nutrient content claims. The agency also requested comments on whether an additional term describing an upper level amount of a nutrient (such as "very high") is necessary and appropriate. The agency also requested comments on the use of synonyms for terms like "high" and "source" and on consumer understanding of the terms proposed as synonyms for "high" and "source."

a. Synonyms

146. A few comments agreed that "rich in" and "major source of" are appropriate synonyms for "high." However, many comments disagreed with the proposed synonyms. Many of the latter comments stated that the agency should not allow use of any synonyms because the use of synonyms will be very confusing to consumers and could easily mislead them. A few comments requested the additional synonym "excellent source of" for "high."

Other comments agreed that "good source of" and "important source of" are appropriate synonyms for "source." However, many comments disagreed with the proposed synonyms. A few comments requested the use of additional synonyms for "source" such as: "meaningful source," "significant source," "provides," and "fortified with." Some stated that the term "provides" informs consumers that the food supplies the nutrient in question and has been in common use on food labels for years further assuring consumer familiarity with it. Some stated that the term "fortified with" has also been used on food labels for years, and is easily understood by consumers.

The agency notes that section 3(b)(1)(A)(ix) of the 1990 amendments provides that, in defining terms used for nutrient content claims, the agency may include similar terms that are commonly understood to have the same meaning as defined terms. Thus, the 1990 amendments clearly give the agency the authority to allow for synonyms. Moreover, section 403(r)(4)(A)(ii) of the act authorizes any person to petition the Secretary (and FDA, by delegation) for permission to use terms consistent with those defined by the agency under section 403(r)(2)(A)(i). Therefore, it is clear that the act contemplates that synonyms can be used. Further, the agency still believes, as stated in the general principles proposal (56 FR 60421 at 60444), that certain synonyms should be allowed in order to provide some flexibility in the use of defined terms.

The agency has, however, reconsidered the proposed synonyms for "high" and has revised some of them in this final rule to include terms that it believes would be more readily understood by consumers, and that convey the qualitative aspects of "good source" and "high." FDA recognizes that the synonyms it is providing for involve judgment on its part, and that individuals may have different views on appropriate synonyms. Nonetheless, FDA believes that a limited number of

synonyms will provide flexibility for food manufacturers in making claims and has endeavored to exercise reasonable judgment in providing for some synonyms while avoiding granting so many synonyms as to promote consumer confusion about their meaning.

Thus, in § 101.54(b), FDA is retaining "rich in" and adding "excellent source" as synonyms for "high." The agency is also providing for the use of "contains" and "provides" as synonyms for "good source" in § 101.54(c). FDA has deleted the proposed synonyms "major source of" for "high," and "important source of," for "good source." FDA notes that the terms it has added to the final rule, "excellent source," "contains," and "provides" are terms that have been used in the past and thus consumers will be familiar with them.

b. Definitions

147. Several comments agreed with the agency's proposed definition of "high" and the rationale upon which it was based, while other comments disagreed with the proposed definition. A few of the comments argued that 20 percent of the RDI or DRV is too high and would lead to little consumer benefit because few foods would be eligible to bear a "high" claim. One comment suggested lowering the eligibility level to 15 percent of the RDI or DRV so that more products would meet the definition without unnecessary supplementation.

The agency recognizes that many foods will not be able to meet the definition for "high." However, the agency is not persuaded by comments suggesting that it lower the eligibility level in the definition of "high" for this reason. The agency tentatively concluded in the proposal, and continues to believe, that a criterion of 20 percent or more of the RDI or DRV provides an appropriate basis for upper-level nutrient content claims.

Furthermore, the agency does not agree with comments that few foods would be eligible to bear "high" claims. In arriving at a definition for "high," FDA used its food composition data base to examine the types of foods that contain nutrients at levels that meet or surpass 20 percent of the proposed reference value per serving (Ref. 35). For the majority of the 17 nutrients considered, at least 10 percent of the foods in the data base contained 20 percent or more of the proposed RDI or DRV. For these nutrients there was at least one and often more than one food category that contained a substantial number of foods containing 20 percent or more of the RDI or DRV. Those nutrients for which fewer than 10 percent of the foods in the data base contain 20 percent or more of the RDI or DRV were calcium, magnesium, copper, manganese, potassium, pantothenic acid, and vitamin A. However, even with these nutrients (with the exception of potassium), there were a substantial number of foods in at least one food category that would qualify for "high" claims if the proposed definition were used.

Thus, the agency concludes that the 20 percent eligibility level will permit a sufficient number of food items to bear a "high" claim to allow consumers to use the claim in selecting a varied diet, and that this level provides an appropriate basis for upper-level nutrient content claims and can readily be used by consumers to implement current dietary guidelines. Therefore, FDA is retaining the 20 percent eligibility level in the definition of "high."

148. Several comments suggested lowering the eligibility level of "high" and "source" for dietary fiber claims. They argued that the proposed levels are too restrictive given that fiber is not ubiquitous in foods, and that it would preclude some good sources of dietary fiber, such as fruits, vegetables and whole grain breads, from bearing a "high fiber" claim. Suggested levels were as follows: "high" as 3 g and "source" as 1 g per serving; "high" as more than 4 g and "source" as 2 to 4 g per serving; and "high" as 4 to 8 g and "very high" as greater than 8 g per serving.

The agency has reviewed the comments and is not persuaded to lower the eligibility levels for "high" or "source" claims for dietary fiber. The agency agrees that fiber is not ubiquitous in foods. However, FDA notes that there are some fruits and vegetables that do qualify for "high," and considerably more that qualify for "source," claims for fiber under the proposed definitions. Based upon nutrient values for the 20 most commonly consumed raw fruits and raw vegetables (56 FR 60880, November 27, 1991, and corrected at 57 FR 8174, March 6, 1992), at least 25 percent of the products listed would be able to meet the proposed definition for "source." Furthermore, the agency believes that it is important to maintain consistency in defining terms for all nutrients and food components. Therefore, FDA is making no change in response to these comments.

149. A few comments requested that FDA define "high" and "source" for soluble and insoluble fiber. The comments stated that the Expert Panel on Dietary Fiber for the Federation of American Societies of Experimental Biology (FASEB) estimates that the dietary fiber in the current diet is comprised of approximately 70 to 75 percent insoluble fiber and 25 to 30 percent soluble fiber, and that some individuals are seeking products with higher levels of the specific fiber components.

The agency has established a DRV for dietary fiber but not one for insoluble or soluble fiber because no quantitative guidelines for daily intakes of soluble and insoluble fiber components have been established. Therefore, the agency has no basis on which to define "high" for insoluble and soluble fiber and has not made the suggested change.

150. One comment suggested that "high" and "source" claims for protein should be based on protein quality as well as level because such claims may be misleading if a food contains a lower quality protein. The comment suggested as a second criterion that a "high" in protein claim be allowed only for foods with a protein digestibility-corrected amino acid score (PDCAAS) greater than or equal to 40, and that for a "source" of protein claim, the food must have a PDCAAS of greater than or equal to 20.

The agency notes that § 101.9(c)(7)(i), proposed as § 101.9(c)(8)(i), provides that the percent DRV for protein must represent the corrected amount of protein based on its PDCAAS. Thus, the agency has already factored in the PDCAAS (see the discussion of protein quality in the Mandatory Nutrition Labeling proposal). Therefore, the agency believes that adding a second criterion based on the PDCAAS for "high" and "good source" in protein claims is not necessary. To determine whether a product qualifies for a claim as "high" in, or as "good source" of, protein, manufacturers must use the percent DRV for protein in a food that represents the corrected amount of protein based on its PDCAAS.

151. Some of the comments recommended defining the term "very high" to provide for use of this claim when a food contains 30 percent or more of the RDI or DRV per serving, so that consumers can distinguish between foods with "high" levels of nutrients and those with significantly more. Some comments recommended that the agency permit the term "principal source" as a synonym for "very high." However, a few comments agreed with the agency's position that the term "very high" should not be defined because allowing such a term could discourage consumption of a wide variety of foods in favor of fewer highly fortified foods and supplements. Other comments

proposed a three- or four- level system for claims that emphasize the presence of a nutrient. One suggested a three level system is as follows: "source of" as 10 to 19 percent; "good source of" as 20 to 49 percent; and "excellent source of" as 50 percent or more. A suggested four-level system is as follows: "source of" as 10 to 19 percent; "good source of" as 20 to 34 percent; "very good source of" as 35 to 49 percent; and "excellent source of" as 50 percent or more.

The agency has reviewed these comments and is not persuaded that it should define terms that correspond to levels of a nutrient that normally do not occur naturally in foods, e.g., "very high." In the general principles proposal (56 FR 60421 at 60443), the agency stated that defining a term such as "very high" could discourage adherence to current dietary guidelines such as those stated in "Nutrition and Your Health: Dietary Guidelines for Americans" (Ref. 7), which emphasize the need to select a diet from a wide variety of foods and to obtain specific nutrients from a variety of foods rather than from a few highly fortified foods or supplements. The comments provided no information to cause the agency to change its position.

152. A majority of comments agreed with the agency's proposed definition for "source," while a few comments disagreed. Generally, the latter comments contended that the agency should not define "source" because consumers cannot reasonably be expected to distinguish between foods that are "high" in a nutrient as opposed to foods that are simply a "source" of a nutrient.

The agency agrees that consumers may not be able to understand the distinction between the meanings of "high" and "source." For example, the term "high" has a quantitative connotation, while the term "source" merely connotes that a nutrient is present but does not signify the quantity present. Therefore, the term "source" alone does not enable the consumer to conclude that the level of nutrient present is less than "high." However, the agency believes that the term "good source" conveys the appropriate information for a midlevel content claim, i.e., that a dietarily significant level of the nutrient is present, but that the level present is not exceptional with respect to levels naturally found in foods. Therefore, the agency is revising in § 101.54 the primary term for midrange nutrient content claims from "source" to "good source."

Thus, FDA concludes that adopting a two-level approach to claims that emphasize the presence of a nutrient based upon "good source" (as a replacement for "source") and "high" as the representative terms will provide meaningful information to consumers consistent with the intent of these proposed definitions.

FDA is, however, making a change in § 101.54. In proposed § 101.54(a)(3), FDA referred to § 101.36, in which the agency proposed to set forth the requirements for nutrition labeling of dietary supplements. In October of 1992, the Dietary Supplement Act of 1992 was enacted, which imposes a moratorium on implementation of the 1990 amendments. In response to this moratorium, FDA is not adopting § 101.36 at this time. Therefore, FDA has deleted the reference to § 101.36 from § 101.54(a)(3). FDA intends to revisit this issue in accordance with the provisions of the Dietary Supplement Act of 1992.

153. One comment stated that for fresh fruits and vegetables, the eligibility level for "source" should be 5 percent of the RDI for a nutrient because several nutrients occur naturally in fruits and vegetables at levels below 10 percent of the RDI.

The agency is not persuaded that the criteria for a mid-range nutrient content claim should include a lower eligibility level for fresh fruits and vegetables. As stated in the general principles proposal (56 FR 60421 at 60444), the agency has long held that a food is not a significant source of a nutrient unless that nutrient is present in the food at a level equal to or in excess of 10 percent of the U.S. RDA in a serving. The agency is unaware of any evidence suggesting that this policy should be changed, and none was presented in any comments to the proposal. Therefore, the agency is not including a lower eligibility level in the definition of "source" for fresh fruits and vegetables.

154. Some comments disagreed with the agency's exclusion of total carbohydrates from coverage under the proposed definitions for "high" and "source." The comments stated that "high" and "source" should be defined for complex carbohydrates because health authorities recommend that consumers increase the amount of complex carbohydrates in their diets.

The agency does not agree that it should define "high" and "good source" for complex carbohydrates. The agency has concluded that it is unable to define "complex carbohydrates," as discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**. Therefore, there is no basis for nutrient content claims about this nutrient.

155. One comment suggested establishing definitions for "source" for polyunsaturated fatty acids and monounsaturated fatty acids because health authorities recommend increasing the intake of unsaturated fat while decreasing the intake of saturated fat.

Because the agency has determined that a DRV for unsaturated fat (including polyunsaturated and monounsaturated fatty acids) is potentially misleading, as explained in the RDI's and DRV's final rule, published elsewhere in this issue of the **Federal Register**, the agency concludes that there is no basis for defining "high" and "good source" for unsaturated fat.

156. A few comments opposed proposed § 101.54(d) that requires that unless a food meets the definition for "low fat" (3 g or less fat per serving and per 100 g), a "high fiber," "source of fiber," or "more fiber" claim must be accompanied by a declaration of the amount of total fat per serving in immediate proximity to the claim and preceding the referral statement. These comments stated that this provision targets only fat as an unhealthy nutrient, and therefore it is discriminatory and anti-competitive.

The focus on fat in conjunction with fiber claims derives from the statute itself. As stated above, section 403(r)(2)(A)(v) of the act provides that a claim may not state that a food is high in fiber unless the food is low in total fat, or the label discloses the level of total fat in the food. Thus, § 101.54(d) is required by the statute, and the agency is retaining this requirement in the final rule. Moreover, it is consistent with the statute's focus on fat in conjunction with fiber claims to require a similar fat disclosure when a "good source" or "more" claim for fiber is made.

c. relative claims

Sections 3(b)(1)(A)(iii)(III), (b)(1)(A)(iii)(IV), and (b)(1)(A)(iii)(V) of the 1990 amendments require that the agency define the terms "light" or "lite" (referred to collectively in this document as "light"), "reduced," and "less," unless the agency finds that the use of any of these terms would be misleading under section 403(a) of the act. These terms are used for comparing the amount of nutrient in one food with the amount of the same nutrient in another food or class of foods. The comparisons are called "relative claims." In the general principles proposal, the agency proposed definitions for "light," "reduced," and "less," as well as the terms "fewer" and "more." In addition, the agency proposed in § 101.13(j), requirements

specifying: (1) The reference foods that may be used as a basis for comparing the level of nutrients in one food with the level of those nutrients in another food for the various types of relative claims; (2) the information about the foods being compared that must accompany the claim; and (3) the minimum absolute amount of a nutrient by which the food must differ from the reference food in order to make a relative claim.

The definitions for relative claims proposed in the general principles proposal placed "less" (or "fewer"), "reduced," and "light" on a continuum using two criteria, both of which a food would have to meet to bear a specific relative claim. First, the proposal would have required that a food be reduced in the particular nutrient by a specific minimum percentage, depending on the claim. Secondly, it would have required that the level of a nutrient in the food be reduced by a minimum absolute amount (e.g., 3 g fat). The agency believed that such a regulatory scheme would limit consumer confusion with respect to the meaning of these terms.

To provide a basis by which comparisons between two foods could be made using relative terms, the agency proposed three types of reference foods (56 FR 60421 at 60445). These reference foods were: (1) A composite value of all foods of the same type, referred to as an industry-wide norm (proposed § 101 13(j)(1)(i)), which could be used as a basis of comparison for all relative claims; (2) a manufacturer's regular product (§ 101 13(j)(1)(ii)) which could be used for "reduced," "less," and "more" claims; and (3) a food or class of foods whose composition is reported in a current valid data base (proposed § 101.13(j)(1)(iii)) for use with "less" and "more" claims.

However, the agency acknowledged that it is possible that because of the natural vagaries of the language (56 FR 60421 at 60458), the terms "reduced" and "less" (or "fewer") may have no innately understood differences. Consequently, the agency acknowledged that any proposed regulatory distinction between the two terms may still be misleading. Therefore, the agency discussed the possibility, as an alternative approach, of providing the same definition for "reduced" and "less" and requiring information describing exactly how the foods differ to accompany the claim. Under this scheme, the percent that the nutrient in the labeled food differed from the reference food, a comparison of the actual amounts of nutrient in the labeled food and the reference food, and the identity of the reference food would have been conspicuously disclosed on the PDP of the label. The agency did not, however, discuss what reference foods would be appropriate as the basis for these claims if they were given the same definition. In the proposal, FDA discussed the possibility of publishing a supplemental notice on this alternative. Although a document was drafted and made available at a hearing that the agency held in January of 1992, it was never published in the **Federal Register** and thus must be considered a draft. However, the agency has fully considered comments it received on the alternative approach in arriving at this final rule.

1 "Reduced" and "less" (or "fewer")

a General provisions

Relative claims have traditionally been defined by the agency using a minimum percentage reduction. Under existing regulations, to make a "reduced sodium" claim or a "reduced calorie" claim, for example, the food must be reduced by 75 percent in sodium (§ 101.13(a)(4)) or 33 1/3 percent in calories (§ 105.66(d)). Moreover, in earlier documents on cholesterol claims, the agency proposed to require that cholesterol be decreased by 75 percent for a food to make a reduced claim (51 FR 42584, November 25, 1986; 55 FR 29456, July 19, 1990). The minimum percentage reduction has been used by the agency to ensure that the level of the nutrient that is the subject of a claim in a food that bears a claim has been decreased by a significant amount compared to the reference food.

In the general principles proposal FDA proposed that for a food to bear the term "reduced," it must contain at least one-third fewer calories or 50 percent less fat, saturated fat, cholesterol, or sodium than the reference food. To bear the term "less" (or "fewer") the agency proposed that a food must contain at least 25 percent less of the nutrient than the reference food.

However, the agency was concerned about misleading relative claims that highlight a decrease in the amount of a nutrient on products that normally contain only a small amount of that nutrient. For example, if such claims were allowed on the basis of a percentage reduction only, a food containing 50 calories per serving could be reformulated to contain 33 calories (a one-third reduction) and thereby qualify to make a "fewer" claim. The agency was concerned that such claims would be misleading because the difference in the amount of the nutrient would be insignificant with respect to the total daily diet.

To ensure that claims for products having relatively small amounts of nutrient not bear a claim unless the difference in the amount of nutrient was significant relative to the total daily diet, the agency proposed that a product also be reduced by an absolute minimum amount in order to bear a claim. The agency proposed to require that the minimum reduction necessary for the food to bear a relative claim be equal to the value of "low" for that nutrient, i.e., a reduction of at least 40 calories, 140 mg of sodium, 3 g fat, 1 g saturated fat, or 20 mg cholesterol. Consequently, the agency proposed that the definitions for "reduced" and "less" claims be based on both a minimum percentage difference and a minimum absolute difference in the amount of the nutrient.

In the general principles proposal (56 FR 60421 at 60458), as discussed above, FDA also requested comment on an alternative approach under which "reduced" and "less" (or "fewer") would have the same definition, and there would be a numeric disclosure of the actual amount and the percentage that nutrient in the labeled food differed from the reference food Under this approach, there would not be a single, across-the-board minimum percent reduction required to support the claim, but any claimed reduction or difference in the level of a nutrient would have to be large enough to be nutritionally significant.

157. Many comments said that there was an insufficient distinction between the terms "less" and "reduced" to warrant separate definitions for these terms, and that use of the two terms was confusing. They suggested that "reduced" not be defined. Other comments suggested that "less" (or "fewer") was the redundant term and should not be defined. However, many more comments stated that "reduced" and "less" should have the same definition. These comments said that the distinction made by FDA is artificial and confusing, and that consumers do not understand there to be any real distinction between the two terms. Many comments said that declaration of the extent of the reduction is more meaningful than the descriptive term used because it provides more information about the nutrient content of the product. Some stated that separate definitions would make it more difficult for manufacturers to meet consumer demand for modified products that comply with defined terms.

The agency has reviewed these comments and is persuaded that the terms "less" and "reduced" may not

have two distinct nutrition meanings to the ordinary consumer, and that, therefore, it could be confusing if the terms were to have two distinct nutrition definitions. The agency considered eliminating one or the other of these terms but chose not to do so. Both of these terms are listed in section 3(b)(1)(A)(iii) of the 1990 amendments. While FDA could have decided not to define one of the terms listed in that section if it found that the use of the term would be misleading, the agency has no information on which to base such a conclusion for either "less" or "reduced."

The current use of both "reduced" and "less" suggests that both terms have a place in the market. The terms are commonly understood to have different meanings. "Reduced" applies to a characteristic of an entity that has been altered with the resulting entity differing from the original by only that alteration, while "less" encompasses "reduced" and can also apply to a difference in a characteristic between two distinct entities (Ref. 25). Accordingly, as discussed in detail below, the agency is revising new §§ 101.60(b)(4), 101.61(b)(6), 101.62(b)(4), (c)(4), and (d)(4), by providing the same definition for the terms "less" (or "fewer" in the case of calories) and "reduced," (See comments 158 through 160 of this document). It is also deleting the separate definition for "less" (or "fewer") proposed in §§ 101.60(b)(5), 101.61(b)(7), 101.62(b)(5), (c)(4), and (d)(5). Instead of distinct definitions for each of the two terms, the agency will rely on the information that accompanies the claim to inform consumers of the levels of reduction of a nutrient achieved by the labeled food. However, as is discussed in greater detail in comment 204 of this document, the agency believes that because of their different commonly understood meanings, the two terms may not always be used interchangeably.

158. There was only limited support for the definitions proposed for "reduced" and "less," which would have required a minimum percentage reduction and a minimum absolute reduction for a product to bear such a claim.

Generally, the comments expressed concern that the two part definition, particularly because of the minimum absolute reduction, was too strict. Many comments opposing the minimum absolute reduction requirement requested that it be deleted in the final rule. These comments said that such a requirement discriminated against products with small serving sizes. They cited situations in which the modified product might contain substantially less of a nutrient, on a percentage basis, compared to the reference food, but where the labeled food did not contain an amount of the nutrient sufficient for the food to be reduced by the minimum absolute amount. (One comment gave as an example, a serving of sour cream that contains 60 calories. A one-third reduction is 20 calories, which is only one-half of the 40 calories proposed as the minimum calorie reduction necessary in order to make a claim.) The comments stated that although differences in the absolute amount of a nutrient in such products might be small, the nutritional benefits derived from several servings of similarly modified foods over a day could have a significant impact on the level of the particular nutrient in the total diet.

Comments suggested a wide variety of alternative definitions, including various minimum percentage reductions, some with minimum absolute reductions and others without. Several comments that supported a definition based solely on a minimum percentage reduction stated that such a criterion is necessary to ensure that claims are made only for nutrient reductions that are nutritionally significant, especially for those foods containing large amounts of a nutrient. They gave as examples salty soups having 1,000 mg of sodium and candy bars with 300 calories.

Only a few comments preferred a minimum absolute reduction over a percentage reduction as a sole criterion. However, most of those comments voiced little reason for their preference. Of those commenting, a very few stated that without the proposed minimum reduction requirements, claims might be permitted on products where only very small reductions were made. They said that if the products were already very low in, or free of, the nutrient, such claims would be misleading.

A few comments suggested that a minimum absolute reduction other than the proposed values based on the definition for "low" should be used to control claims made for very small nutrient reductions, e.g., 20 or 30 calories, instead of the proposed 40 calories; 1.5 or 2 g fat instead of 3 g fat; 0.5 g saturated fat instead of 1 g; 35 or 100 mg sodium instead of 140 mg; and 10 or 15 mg cholesterol instead of 20 mg.

Some comments suggested that there should be no single, across-the-board minimum percentage difference or minimum absolute reduction, but that there should be a general requirement that the nutrient reduction be large enough to be nutritionally significant. Others suggested that "reduced" or "less" claims be permitted for any decrease in the level of a nutrient in a food so long as small improvements in a product were not exaggerated, and the absolute difference was disclosed. One comment suggested that any definition would serve as a floor representing the minimum amount of reductions that manufacturers would make, and that because of competitive forces, actual reductions would increase.

The agency proposed that both a minimum percentage reduction of a nutrient in a food and a minimum absolute reduction were necessary in order to ensure that meaningful reductions in the amount of nutrient in a food would occur, and thereby increase the likelihood that selection of nutritionally reduced foods would have a positive effect on an individual's overall dietary intake of the nutrient. The agency believed that a minimum absolute reduction was necessary to ensure that relative claims were significant and would not be made on products that, although they had a large percentage reduction, had only insignificant changes in the amount of nutrient. Such reductions could occur if relative claims were based only on a minimum percentage reduction in products that normally contain only a small amount of the nutrient. On the other hand, the agency was also concerned that products containing large amounts of a nutrient not have insignificant reductions compared to the amount of nutrient in the food and its overall contribution of the nutrient to the total diet.

The comments have convinced the agency that a definition using both criteria is too restrictive and will prohibit claims on a number of products that are useful in constructing diets consistent with dietary guidelines. However, the agency is not convinced, nor have the comments supported with data or other information, that having no minimum criteria will provide sufficient assurance that reductions in the level of a nutrient will be sufficient to prohibit misleading claims by assuring that only foods with nutritionally significant reductions may bear a "reduced" or "less" claim. Without such criteria, it would be difficult to ensure that nutrient reductions in a product were large enough to be significant in the case of products with a small amount of a nutrient or sufficient relative to the food's contribution of the nutrient to the total diet for products with a large amount of a nutrient.

In addition, the agency does not agree with the suggestion that additional labeling can be used to counteract a misleading claim that is used to represent a truly insignificant reduction in the level of a nutrient. Stating the absolute amount of difference, as recommended by the comment, would suggest that the product had undergone nutritionally significant reductions when it had not.

Therefore, FDA concludes that it is necessary to establish specific requirements to define when the difference in the level of a nutrient is large enough that claims about the difference are not misleading, and the terms "less" and "reduced" may be used.

The agency believes that of the options suggested in the comments, either a percentage reduction or a minimum absolute reduction offers the greatest assurance that the reductions achieved will be nutritionally significant.

The agency has evaluated both types of criteria. If an absolute minimum reduction were used as the sole criterion, there would always be a nutritionally significant change in the amount of the nutrient for all foods bearing the terms "reduced" or "less." However, the agency also considered the argument that was strongly made in the comments that a minimum absolute reduction for relative claims may unfairly discriminate against products with small serving sizes. Furthermore, the agency is persuaded by the comments that smaller reductions, in nutrient-dense foods traditionally used in small amounts for example, 20 calories in sour cream rather than 40 calories, may be beneficial to consumers and will not be misleading if changes in absolute amounts are declared. Although the agency remains convinced that only claims about significant changes in a product should be authorized, it acknowledges that for products with small servings, nutrient reductions that do not meet the proposed absolute minimum reduction requirements can be significant in the context of a daily diet.

Many foods with small serving sizes, crackers for example, may be consumed several times throughout the day. Thus, the agency agrees that the small absolute reductions that occur with consumption of each serving of such foods may have a significant cumulative effect on the amount of a nutrient consumed over the course of a day. The agency understands that label claims that highlight such changes could assist consumers in making useful changes in their diet.

However, if only a minimum absolute reduction is required in order for a product to bear a "reduced" or "less" claim, products with larger serving sizes that contain large amounts of a nutrient could still contain a large amount of the nutrient after reduction.

On the other hand, with a minimum percentage reduction requirement, more products containing small amounts of a nutrient would qualify to make "reduced" or "less" claims based on smaller absolute reductions in the amount of a nutrient than would be permitted under the requirements of the proposal. Such a criterion would also require larger, more nutritionally significant changes on products containing large amounts of the nutrient.

The agency has carefully weighed the concerns expressed by the comments. The agency believes that the terms "less" and "reduced" should be used only when a nutritionally significant reduction in the level of the nutrient has been reached so as not to mislead consumers into believing that a product would provide nutritionally significant reduction in the level of a nutrient when it would not.

The agency has determined that it is most appropriate to require a minimum percentage reduction rather than a minimum absolute reduction in order for a product to bear a "reduced" or "less" claim for the following reasons. First, the use of a minimum percentage reduction instead of a minimum absolute reduction is compellingly supported by comments and generally consistent with the agency's proposed approach. Secondly, it will allow more foods with smaller reductions in a nutrient to make a "reduced" or "less" claim. By eliminating the minimum absolute amount that a nutrient must be reduced for a product to bear a claim, the agency believes that manufacturers may have an additional incentive to produce modified products that are helpful in maintaining healthy dietary practices. Although these changes are smaller per product, they will cumulatively contribute overall to reduction in the amount of certain nutrients in the diet. Thirdly, this approach will assure nutritionally significant changes in products containing large amounts of a nutrient.

Therefore, FDA concludes that it is appropriate to require a minimum percentage reduction in the level of a nutrient in order for a food to bear a relative claim. Accordingly, the agency is deleting from new § 101.13(j)(3) and from the regulations on claims for specific nutrients (§§ 101.60(b)(4), 101.61(b)(6), 101.62(b)(4), (c)(4), and (d)(4)), the requirement for an absolute reduction in the level of a nutrient in order for the food to bear a claim.

159. Several comments suggested that to prevent relatively small quantitative reductions from being touted as large percentage reductions, as an alternative to a minimum absolute reduction, "reduced" and "less" claims not be permitted on products if the reference food qualifies for a "low" claim.

The agency is concerned that for products in which the level of a particular nutrient is very low, requiring only minimum percentage reductions would mean that very small, nutritionally insignificant changes could be made in the amount of the nutrient, and the product would still qualify to make a "reduced" or "less" claim. It agrees that the suggested approach would provide assurance that the changes made to qualify for a "reduced" or "less" claim are not so small as to not be nutritionally significant. The agency notes that the value for "low" is the level at or above which the amount of a nutrient becomes significant relative to the total diet. A difference between two foods in a nutrient that is present in both foods at a level that is less than that of nutritional significance is not a significant difference. Such differences cannot be considered meaningful relative to the overall diet because even the level of the nutrient in the reference food is so low that the impact of its consumption on total dietary intake of the nutrient is minimal.

Thus, the agency agrees with the comments that contended that it would be misleading for products to make a relative claim if the nutrient is present at a "low" level in the reference food. Consequently, the agency is prohibiting "reduced" and "less" claims that are based on a difference from a reference food that meets the requirement for a "low" claim with respect to the nutrient in question. The agency is revising new § 101.13(j)(3) to include this requirement.

The agency believes that the overall approach described above will provide the best balance between encouraging manufacturers to produce foods with significant nutrient reductions by authorizing them to tell the public about the products' attributes and protecting consumers from being misled by claims directing them to foods that are not meaningfully improved in nutrient content.

160. Many comments discussed the percentage that a food should be reduced to bear a "reduced" or "less" claim. They suggested a wide range of percentage reductions, from a 50

percent reduction for "reduced" or "less" for all nutrients (including calories) to a 10 percent reduction for all nutrients. Some comments stated that FDA has historically used a 10 percent reduction as the minimum amount required for nutritional significance, and, therefore, it was an appropriate basis for a "reduced" claim. Other comments said that small incremental nutrient changes such as 10 percent are beneficial to consumers and represent modifications that are achievable. The comments argued that banning label information about incremental changes is likely to hurt consumers and discourage innovation.

Many other comments stated that a 25 percent reduction was an appropriate minimum reduction requirement. These comments said that using this level would allow "reduced" and "less" to have the same definition as originally proposed for "less." In addition, they said that a 25 percent reduction is a nutritionally significant reduction.

One such comment said that there is a sound scientific foundation upon which to require a minimum percentage reduction of 25 percent. The comment included comparisons of target daily intakes to current intakes and concluded that a 25 percent reduction is fully consistent with the reduction in intake needed to achieve current national dietary goals for fat, saturated fat, and cholesterol. The comment also concluded that although these calculations suggested that a 40 percent overall reduction in sodium was necessary to reach dietary goals, a 25 percent reduction was more practicable. This comment said that its conclusion was based on experience in marketing foods with reductions in sodium. It said that it had found that smaller incremental reductions were necessary to avoid consumer rejection of altered foods. The comment said that taste preferences will change as consumers adapt to lower salt levels, and that a 25 percent incremental reduction at this time would be a practical approach to the 40 percent reduction that is ultimately desired.

Another comment stated that a 25 percent threshold for claims was appropriate because it is supported by a variety of international governments and organizations, including Codex Alimentarius.

A few comments said that a one-third minimum reduction in the level of a nutrient was an appropriate criterion for a food to bear a "reduced" or "less" claim. They stated that a one-third reduction was a significant reduction, and that it is consistent with the percentage reduction required for "reduced calorie" claims (§ 105.66). Other comments suggested that foods should be permitted to bear a "reduced" or "less" claim only if there was a 50 percent or greater reduction in a nutrient (including calories) than the reference food. They said that requiring this percentage reduction was important for consistency across the nutrients. Other comments said that a minimum percentage reduction of 50 percent was necessary to ensure that the reduction is truly nutritionally significant compared to the original food and is useful to consumers in following dietary guidelines. A very few comments suggested that the definition for "reduced sodium" and "reduced cholesterol" should be returned to the 75 percent reductions previously established or proposed.

The agency does not agree that it has established a precedent for using 10 percent as a criterion for a minimum percent reduction in the level of a nutrient. Current agency regulations (§ 101.9(c)(7)(v)) provide that a food is not a significant source of a nutrient unless the nutrient is present at a level that is 10 percent of the U.S. RDA, and that no claim may be made that a food is nutritionally superior to another unless it contains at least 10 percent more of the U.S. RDA of the claimed nutrient per serving than the other food. For "reduced" and "less" claims, on the other hand, the percentage is used as the basis for a direct comparison between the amount of the nutrient in each of the foods. Therefore, the agency concludes that this comment did not provide sufficient justification to permit "reduced" or "less" claims on products having only a 10 percent reduction.

In addition, in the final rule on sodium labeling (49 FR 15510 at 15521, April 18 1984), the agency stated that a 10 percent reduction criterion for comparative claims was too low because of product variability. The agency said that because of expected statistical distribution of a nutrient (in that case sodium) in the food, there is a measurable probability that the sodium content of a sample of a product for which a lowered sodium content claim was made would actually exceed the sodium content of a sample of the unaltered product. Because it had been suggested that such product variations may not be as common now as they were in 1984 because of manufacturers' ability to more precisely control the amount of nutrient in a product, the agency solicited comments on this suggestion. However, comments provided no data to substantiate that improvements in food technology or other factors make it practicable for manufacturers to reliably achieve a 10 percent reduction. Thus, in the absence of data to support a different finding, the agency concludes that, because of product variability, a 25 percent reduction is the lowest level of reduction that can be supported.

The agency's decision to require a 25 percent reduction as the basis for a "reduced" or "less" claim is also based on the recognition, as outlined in the general principles proposal (56 FR 60421 at 60451), that this level will provide an incentive for manufacturers to reduce the level of the relevant nutrients in their food and at the same time has the potential to produce meaningful changes in overall nutrient intake for consumers. The comments provided significant support of these conclusions.

While the agency agrees that large reductions (such as 33, 50 or 75 percent) in the levels of certain nutrients present in a food may increase the likelihood that these foods will decrease the nutrient intakes of individuals who select these foods, FDA cannot agree that these percentage reductions are the most appropriate criteria on which to base "reduced" and "less." The comments supporting levels higher than a 25 percent reduction did not provide evidence that a 25 percent reduction would not be adequate, nor did they specifically demonstrate why a higher level than 25 percent is needed.

FDA recognizes that it has previously provided guidelines and definitions for nutrient reductions in foods, and that these specified reductions were greater than 25 percent. However, the agency now believes that with the advent of mandatory nutrition labeling and an ever increasing interest in healthy eating, more manufacturers will attempt reductions in the levels of nutrients like fat, saturated fat, cholesterol, and sodium in their foods. With the definition set at the reasonably achievable level of a 25 percent reduction, more foods are likely to be available, and consumers will be able to select from more and different foods in order to meet dietary guidelines. Furthermore, as suggested by one comment, market competition will undoubtedly spur some manufacturers to exceed this minimal reduction, thereby resulting in foods with even greater levels of reduction.

Therefore, the agency has concluded that an appropriate minimum percentage reduction for the terms "reduced" and "less" is 25 percent. Accordingly, the agency has revised new §§ 101.60(b)(4)(i), 101.61(b)(6)(i), 101.62(b)(4)(i), (c)(4)(i), (d)(4)(i)(A), and (d)(4)(ii)(A) to reflect this change.

161. One comment stated that the percentage reductions expressed on the label should not exceed the actual amount of the reduction of the nutrient in the product. Thus, the comment argued that manufacturers should be prohibited from "rounding up" the amount of the reduction to make it appear greater than it actually is.

The agency advises that for a product to bear a claim, the level of the nutrient must be reduced by at least a certain value. Thus, the amount of the reduction must be equal to or greater than the specified amount. There is no provision for rounding up the difference in nutrient content.

It is not clear to FDA whether the "rounding up" referred to in this comment is the rounding off provided in the regulation on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**. If the comment was concerned about such rounding, the agency advises that declaration of nutrients in, for example, 5 calorie increments or 0.5 g fat increments, which is permitted in nutrition labeling under § 101.9(c), is not permitted in determining the difference in nutrient levels between two foods. However, as discussed in the preamble of the proposal on mandatory nutrition labeling (55 FR 29487, July 19, 1990), the rounded differences are nutritionally insignificant. The agency would not consider a claim to be misleading if the declaration of the difference in absolute amount of nutrient between the foods were rounded off in conformance with rounding provisions for nutrition labeling in § 101.9.

162. A few comments requested that the regulation provide for use of "modified" as a synonym for "reduced" or "less."

The agency does not consider the word "modified" by itself to be a nutrient content claim. While it implies the product has been changed, "modified" does not necessarily imply that the change is in the content of a nutrient. As discussed elsewhere in this document, the word "modified" is permitted for use as part of the statement of identity on foods that qualify for "reduced" or "less" claims. However, "modified" is intended to be used in the presence of these claims, not in lieu of them. The term advises consumers that the product has been changed, and the nutrient content claim describes the change. Accordingly, FDA is not amending the regulation as requested.

163. One comment requested that the agency provide for the term "lower" as a synonym for "less." The comment stated that the term was currently in use on a comparative basis.

The agency agrees that "lower" should be permitted as a synonym for "less." Although the comment provided no further verification of the meaning of the term, the "American Heritage Dictionary," 1976 edition, (Ref. 25) defines the term to mean "below a similar or comparable thing." Such a definition is consistent with the principles for "less" claims which are used to compare two similar or comparable foods. Accordingly, the agency is including in §§ 101.60(b)(4) and (c) (4), 101.61(b)(6), 101.62(b)(4), (c)(4), and (d)(4)"lower" as a synonym for "less" (or "fewer").

164. One comment suggested that "less" rather than only the term "fewer" should be allowed for calorie claims.

As was stated in the general principles proposal (56 FR 60451), the agency defined "fewer calories" instead of "less calories" because the term "fewer" is grammatically correct. The agency does not believe that it is appropriate to amend the regulation to specify use of an improper term. However, FDA does not ordinarily consider a product to be misbranded because it bears a label statement that is grammatically incorrect. Accordingly, because the criteria for "less" and "fewer" claims are the same, the agency will not consider "less calories" to be misleading.

b. "Reduced" and "less" claims for sugar

In the general principles proposal, FDA proposed a definition for "less sugars" that included a minimum percentage difference of 25 percent but did not include a minimum absolute amount criterion. The agency did so because the minimum absolute amount criterion for other nutrients was the amount proposed to be defined as "low." The proposed criteria for "low" claims were based on DRV's for the nutrients, and because there was no DRV for sugars, there was no "low sugars" definition. The agency solicited comments for an appropriate requirement that could be used as the second criterion for this claim and signaled its intentions to establish a second criterion if one were not forthcoming.

165. Only a few comments addressed the term. Some supported defining the claim "less sugars," while a few others suggested that the term "less sugars" is not useful to consumers, is misleading, and should not be used. However, those objecting did not provide information as to why this was so.

As discussed in comment 80 of this document, the agency has determined that the term "sugars free" may be confusing to consumers and therefore is providing for use of the term "sugar free." The agency believes that "less sugars" would also be confusing. Therefore, for consistency the agency has determined that "less sugar" is the more appropriate term to describe reductions in the sugars content. Further, because the comments provided no arguments why the term should be eliminated, and because the term would provide certain useful information to consumers in comparing the sugars content of one food to another, the agency is not persuaded that the definition for "less sugar" should be eliminated. Accordingly, the agency has retained this definition.

In addition, FDA has included use of the term "reduced" in the provision for "less sugar" (§ 101.60(c)(4)). Although the agency had not proposed criteria for "reduced sugar" claims, now that the term "reduced" and "less" have the same criteria, it would be inconsistent not to also permit use of "reduced sugar" claims.

166. Only one comment suggested a second criterion for the definition of "less sugar." It recommended that the claim be permitted only if the labeled food contained at least 2 g less sugar than the reference food.

The comment did not provide rationale or other information to substantiate the recommendation. Consequently, FDA still does not have a basis for a minimum absolute reduction to be used in lieu of a definition for "low sugar." However, as discussed above in response to comment 158 of this document, FDA is no longer using the minimum absolute reduction as a criterion for "reduced" and "less" claims.

In view of this fact, the agency is persuaded that the need for a second criterion for sugar is similarly diminished. The agency has established in new § 101.13(j)(3) (see comment 159 of this document) a requirement that a relative claim may not be made if the amount of nutrient in the reference food is less than the value for "low." Although for consistency, a similar requirement for sugars might be useful, the agency does not believe that there is a compelling reason to definitively establish the criterion, especially given the fact that the basis for such a criterion, a DRV for sugar, does not exist. The agency will evaluate on a case-by-case basis whether claims on food that emphasize a very small reduction in the amount of sugar are misleading.

2. "Light"

a. General

In the general principles proposal (56 FR 60421 at 60449), FDA said that although the term "light" or "lite" is primarily a relative claim that compares one food to another food, it is often used to directly describe the food itself in the way that an absolute claim such as "low calorie" is used. The agency proposed several circumstances in which the term "light" could be used.

167. Several comments were concerned about the way that the term "light" is used in the marketplace. A few comments asserted that the term "light" is purely marketing puffery. Other comments said that "light" has no scientifically acceptable meaning but instead has a multitude of meanings and as such will do more to mislead consumers than assist them in making better food choices. Another comment said that because of the various consumer interpretations of the meaning of the term "light," there needs to be further research on its meaning before the term can be defined. A few comments stated that because "light" has no meaning, it should not be defined.

Section 3(b)(1)(A)(iii)(III) of the 1990 amendments requires FDA to define "light" or "lite" unless it finds that the term is misleading. While the agency agrees that some current uses of the term are misleading, it has not made a finding that the term is inherently misleading, or that it cannot be used in a nonmisleading manner. The agency concludes that it has sufficient information, including consumer surveys cited in the general principles proposal (Refs. 26 and 27) and other information submitted in comments with which to establish an appropriate definition for the term. By defining "light" and the conditions for its use in a meaningful way, the agency intends to help alleviate the confusion caused by the many uses of the term and to ensure that products that bear the term are useful in maintaining healthy dietary practices.

168. A few comments stated that "light" is not an expressed claim, but rather that it is an implied claim. The comments pointed to the House report on the 1990 amendments (H. Rept. 101–538, 101st Cong., 2d sess. 19 (June 13, 1990)) which said that an implied claim is a statement that "implies that the product is low in some nutrient (typically calories or fat) but does not say so expressly" and cited "lite" as an example of such a claim. One comment went on to say that as an implied claim, "light" should be permitted with any nutrient content claim, provided that the food qualifies for the claim.

The agency acknowledges that the House report stated that "lite" was an example of an implied claim. However, the agency believes that this term is used as an expressed claim because, as discussed in the general principles proposal (56 FR 60421 at 60449), it has a history of use both as a relative claim and as an absolute claim. "Light" has been used as a direct statement of the level of both calories and fat in food (see § 101.13(b)(1)). In the proposal, FDA stated that in spite of the reference to "light" in the legislative history, it intended to treat this term as an expressed claim (56 FR 60421 at 60449 through 60450). The comments that addressed this issue did not provide any justification for not following the course that the agency proposed. Therefore, FDA is defining "light" as an expressed claim in this final rule.

b. Definition of "light" based on fat and calories

In the general principles proposal (56 FR 60421 at 60449) the agency acknowledged that "light" has been used for a number of years to connote a wide variety of meanings such as low or reduced calories; reduced fat, sugar, or sodium; light in weight, texture, or color; and thin or less viscous. The agency cited studies that showed a stable perception by the majority of consumers that "light" means that the caloric level has been altered. However, it noted that "light" has also been used to directly describe the food itself in much the same way as the term "low" has been used. Because the agency believed that the definition of the term "light" should be based primarily on consumers' perception that "light" means "reduced in calories," the agency proposed that a food be permitted to bear the term "light" without further qualification if the food had been specifically formulated or processed to reduce its calories by at least one-third compared to a reference food specified in § 101.13(j)(1)(i), with a minimum reduction of more than 40 calories per reference amount and per labeled serving size.

The agency also noted that it had recently allowed the term "light" to be included as part of the name of dairy products that are altered to have, in addition to one-third fewer calories, at least 50 percent less fat. The agency also noted that other normally high-fat products are using "light" to describe fat and calorie reductions. In view of these facts, and because the agency believed that products with large amounts of fat should not be labeled as "light" unless a substantial amount of the fat in the food was also reduced, the agency proposed that if the food derives 50 percent or more of its calories from fat, its fat content must also be reduced by 50 percent or more compared to the reference food that it resembles or for which it substitutes. The proposal also would have required a minimum reduction of more than 3 g of fat per reference amount and per labeled serving size in order to bear the term "light."

169. A number of comments supported the agency's view that the percentage of a food's calories that are derived from fat should be considered in determining whether the food contains a substantial amount of fat and should, therefore, be required to be reduced in fat for the product to bear the term "light." Several comments supported the agency's proposal that 50 percent or more of a food's calories from fat was an appropriate level at which fat reduction should be required. Another comment suggested that if 40 percent or more of a food's calories are normally derived from fat, a fat reduction should be required, but it offered no substantiation for the suggestion. One comment suggested that a food contains relatively high levels of fat if 30 percent or more of the food's calories are derived from fat. It noted that the 30 percent threshold relates to the dietary guideline that no more than 30 percent of the calories in the total diet should be derived from fat. The comment suggested that a food that normally contains more than 30 percent of calories from fat would be inconsistent with this guideline and therefore should be required to be reduced in fat in order to bear the term "light."

The agency has considered these comments and is not persuaded by the comments that it is necessary to change its determination that foods that normally derive more than 50 percent of their calories from fat should be reduced in fat to make a "light" claim. The agency acknowledges that the dietary guidelines recommend that Americans eat a diet that consists of 30 percent or fewer calories from fat. However, because fat is found in only about one-half of the food supply, it is not necessary that each food contain only 30 percent of its calories from fat for the total diet to meet this goal. Rather, because a diet would normally consist of a combination of foods containing various levels of fat, those foods that derive somewhat more than 30 percent of their calories from fat would be balanced by foods that contain less than 30 percent of their calories from fat. A diet consisting of both types of foods

would be consistent with dietary guidelines. Consequently, it would not be necessary for all foods that derive over 30 percent of their calories from fat to be reduced in fat to meet dietary guidelines. There were no comments that suggested the percentage of calories from fat should be raised to a higher percentage. Therefore, the agency is retaining the provision as proposed, that products that normally contain over 50 percent of their calories from fat contain a substantial amount of fat and should, therefore, have the amount of fat they contain reduced to qualify for a "light" claim.

170. While a number of comments agreed with the agency's assessment that "light" is primarily associated with reduced calorie content, a greater number of comments maintained that consumers primarily perceive "light" to mean lower in fat. One comment cited a 1989 Gallup Organization consumer poll stating that 8 out of 10 consumers select "light" products in order to reduce fat consumption. Others cited a survey reported in an article entitled "Americans to Make LIGHTER Choices in the 90's" that appeared in "Calorie Control Commentary," vol. 12, No. 1 (Spring 1990), stating that 83 percent of consumers select products labeled as "light" in the belief that such products are low in fat. One comment included a study that found that 46 percent of consumers think that products labeled as "light" should have "almost no fat" or "no fat at all." Another comment stated that "light" has been used for decades to refer to fat reductions without evidence of consumer misunderstanding. The comment included a survey of 1,000 trademarks using the word "light" and noted that 35 percent of those trademarks were associated exclusively or primarily with reduced fat content in products. Many comments favored allowing "light" claims for foods on the basis of fat reduction alone.

The agency has carefully reviewed these comments and, on the basis of the evidence presented in them, has been convinced that in addition to "reduced in calories," the term "light" is also commonly understood to mean "reduced in fat." Consumers apparently view reductions in fat as a major reason for purchasing "light" products. Therefore, FDA does not consider that the term "light" is appropriately used only on products in which there has been a reduction in calories. The term also is appropriate on products in which there has been a reduction in fat.

171. Many comments contended that the proposed definition for "light" is too restrictive, especially for foods that normally contain large amounts of fat. The comments maintained that certain products, such as butters, ice creams, chocolate-coated ice cream novelties, cheeses, cakes, brownies, muffins, frostings, peanut spreads, savory snacks (pretzels and chips), popcorn, and coffee creamers could not be altered to qualify for a "light" claim under the proposed definition. A number of these comments pointed out that many fat substitutes contain a substantial amount of calories, and that even though it is often possible to reduce the fat content in products by 50 percent, it is not always possible to also reduce the calorie content by one-third unless all or most of the fat is removed.

The comments stated that in the case of ice cream novelties, for example, because some of the preferred fat replacers, such as carbohydrate or protein solids, contain a substantial amount of calories, it is difficult to remove enough of the calories normally contained in the product to achieve a one-third calorie reduction solely by replacing the fat. To accomplish this calorie reduction, the comment said, would require that virtually all of the fat be removed and replaced with an ingredient such as polydextrose which has a lower calorie content than other fat replacers. However, in achieving this caloric reduction, the comments maintained, consumer acceptance is "lost along the way."

The comments asserted that similar problems occur with cheeses and other products. The comments contended that manufacturers' present inability to make products that can substitute for products normally high in fat, that are acceptable to most consumers, and that can meet the "light" definition will significantly reduce labeling and marketing incentives for such products. Several comments maintained that, as a result, many reduced fat alternatives will be removed from the market, and that development of more "light" products will be retarded. Several comments asserted that having fewer options will cause difficulty for consumers who wish to reduce their fat intake to 30 percent or less of their calories from fat, as recommended by dietary guidelines. They stated that, consequently, the criteria for use of the term "light" should not incorporate both a 50 percent fat reduction and a one-third calorie reduction for products with a substantial amount of calories from fat.

The agency has reviewed these comments and is persuaded that because of the difficulty in achieving "light" products that are reduced both in calories and in fat, the agency will not require that both nutrients be reduced for a food to bear the term. FDA believes that while the criteria for making a "light" claim must result in labeling that consumers can understand and rely on, the criteria should also be reasonably achievable to encourage manufacturers to produce altered products that will assist consumers in maintaining healthy dietary practices. The agency recognizes that it is difficult to achieve reductions of both calories and fat in a number of products containing more than 50 percent of calories from fat, particularly dairy products such as cheeses, ice creams, and frozen confections. In addition, consumers will not purchase, and therefore will not benefit from, altered products that do not meet their acceptance requirements.

In the general principles proposal, FDA stated that a majority of consumers associate "light" with a reduction in calories, even though there are other meanings for the term. However, as discussed in comment 170 of this document, the comments provided information that establishes that consumers strongly associate the term "light" with reduced fat levels. Thus, as discussed in more detail below, FDA no longer believes that a reduction in calories in the food is essential or is always expected by consumers who choose a food because it bears the term "light." Accordingly, the agency has deleted from § 101.56(b) the requirement that products that contain more than 50 percent of calories from fat be reduced both in calories and in fat to bear the term "light."

172. In the general principles proposal, FDA requested comment on whether it was necessary to prohibit a "light" claim on a product containing more than half its calories from fat that is reduced by one-third in calories but that has not also been reduced in fat by the required minimum. The agency asked for comment on whether the claim was misleading and should be prohibited, or whether a statement informing the consumer that the product was not reduced in fat would make the label not misleading. In response, the comments did not support the use of a label statement in alerting consumers that a particular product that was labeled as "light" was high in fat. In addition, although comments did not directly suggest that "light" be permitted on foods that derive one-half of their calories from fat that had been reduced by one-third in calories but not by one-half in fat, many comments did suggest that in such foods, fat reduction is necessary.

The Surgeon General's report (Ref. 4) and the NAS's report "Diet and Health:

Implications for Reducing Chronic Disease Risk" (Ref. 12), in considering the effect of diet on an individual's health, concluded that consumption of a diet high in fat, saturated fat, and cholesterol is associated with increased risk of development of certain chronic diseases. These reports and "Nutrition and Your Health: Dietary Guidelines for Americans" (Dietary Guidelines) (Ref. 7) recommend that Americans reduce their consumption of these substances in their diets. Given the significance of dietary intake of fat and saturated fatty acids, FDA believes that it is important to assist consumers in modifying their diets to reduce their intake of these food components and thereby to maintain healthy dietary practices. By ensuring that foods that normally contain large amounts of fat are substantially reduced in fat in order to bear the term "light," FDA believes that it will assist consumers in constructing diets that are consistent with dietary guidelines by providing substitute foods in which there is a large reduction in fats that will assist them in reducing the fat content of their diets. Therefore, FDA concludes that it would not be appropriate to permit the term "light" to appear on a food that normally derives one-half of its calories from fat that has not been reduced in fat content by the required minimum amount. Accordingly, because the term "light" implies that the food is useful in achieving a diet that conforms to dietary guidelines, foods with relatively high levels of fat (i.e., more than 50 percent of calories form fat) must be substantially reduced in fat if they would be useful in such diets. If the fat level in such foods is not reduced, the use of the term "light" in their labeling would be misleading.

To summarize, FDA concludes that consumers understand the term "light" to connote a reduction in fat as well as a reduction in calories, depending on the food involved. Accordingly, the agency has determined that it is appropriate for a food to bear the term when it has been sufficiently reduced in fat or, where appropriate, calories. (The amount of fat or calories necessary to constitute such a reduction is discussed below.) The agency is therefore providing in § 101.56 that the term "light" may be used when the labeled food differs from the reference food by a minimum percentage reduction in either fat or calories (comments 170 and 171 of this document). However, FDA also concludes that for foods that derive more than 50 percent of their calories from fat, the minimum percentage reduction in fat is necessary for the term "light" to not be misleading (comment 172 of this document). The agency, therefore, is providing in § 101.56(b)(1) a requirement for a minimum percentage fat reduction for such foods.

173. Of those commenting on the subject, a large number of comments stated that because it is a relative claim, "light" should be defined in the same manner as the other relative claims, "reduced" and "less." Many comments said that if "reduced," "less," and "light" all had the same definition, consumer confusion about the meaning of these relative terms would be diminished, especially if the exact nature of the modification was specified adjacent to the claim, as would be required by the accompanying information provisions. One comment said that allowing this more liberal definition for "light," but providing information on the exact nature of the reduction, was consistent with the policy of allowing other "light" claims provided the subject physical or organoleptic properties were specified. A few comments said that if FDA set reasonable parameters for use of the terms "light," "reduced," and "less," consumers would receive truthful, easy to understand information, and food manufacturers would be encouraged to produce foods with significant nutritional reductions because they would be able to tell consumers about their product's attributes.

Another comment said that defining "reduced," "less," and "light" at a lower standard than originally proposed for "light" would minimize the number of brand names prohibited on the grounds that the food did not meet the definitional requirements. One comment said that the same definitions for the term "reduced," "less," and "light" would significantly lower the cost to the manufacturer, and eventually to the consumer, by significantly reducing the costs associated with compliance. Other comments said that any definition would serve as a floor, and that competition and innovations in the market place would push actual reductions higher.

The agency has considered the arguments that because "light" is a relative claim, it should be defined in the same manner that the other relative claims "reduced" and "less" are defined. However, the agency is not persuaded by the comments that such a definition is appropriate. "Light" is a term that has special usefulness as a marketing tool for manufacturers to quickly and easily convey to consumers that the product to which the term is attached has been significantly reduced in the level of fat or calories. Although the agency recognizes that specifying the exact nature of the modification would help mitigate confusion caused by similar definitions for all relative claims, the agency is not convinced that defining "light" in the same manner that other relative claims are defined would be consistent with the special position of the term "light" in the marketplace and with the strong impression that products labeled as "light" are particularly useful in achieving a diet that is consistent with dietary guidelines as the available data and comments show.

The agency remains concerned about striking the proper balance between allowing manufacturers flexibility in the use of the term "light" and providing a definition that will ensure that products are improved significantly in the nutritional attributes addressed by the term. Striking the proper balance will provide consumers with meaningful product information and meaningful product choices. To define the term "light" with the same definition as for the terms "reduced" and "less" would sufficiently dilute the term so as to diminish its usefulness. Moreover, the agency is convinced that reserving the term "light" for those products that are more significantly improved will provide a greater incentive for manufacturers to continue to improve their products by providing a unique marketing vehicle by which such nutritionally significant changes can be highlighted for the consumer (See comment 174 of this document).

The agency recognizes the effect that any definition may have on brand names. However, FDA does not believe that it should permit or encourage "light" claims without further qualification on products that do not represent a major modification in fat or calorie consumption, as appropriate. Furthermore, the agency does not believe that the costs associated with compliance relative to distinctions between the two definitions for "light" and "reduced" and "less" are sufficient to warrant modification of this decision, and the comment did not provide cost information to substantiate its assertion. Accordingly, the agency is not providing the same definitions for "reduced," "less," and "light."

174. Comments expressed a variety of opinions as to the minimum percentage of fat by which a food should be reduced to qualify to bear the term "light." A number of comments objected to the 50 percent fat reduction requirement. They asserted that in certain product categories, it is not technically feasible to develop products that are reduced in fat by 50 percent or more and that are acceptable to the

consumer. The comments stated that consumers want products lower in fat but with organoleptic properties similar to the reference foods. Other comments noted a variety of manufacturing problems, such as undesirable changes in the texture, flavor, cooking applications, and storage requirements of a food, that are encountered with a 50 percent reduction in fat in a product. In addition, the comments maintained that replacement of the sensory properties of fat is difficult in low moisture content bakery products. The comments also asserted that a 50 percent or greater fat reduction in cheeses results in products with low consumer acceptance, higher moisture content, increased potential for bitter flavor development, poorer physical properties, such as rubbery texture, and microbial instability during curing and storage.

The comments also stated that a 50 percent or greater fat reduction in savory snacks, such as pretzels and chips, will have significant concomitant reductions in flavor and texture acceptability. Some comments contended that because of these problems, there is a greater likelihood that industry will develop and market fat modified foods with a one-third fat reduction than foods with a 50 percent reduction. The comments maintained that without these reduced fat products, consumers will be less able to achieve a diet composed of a variety of different foods (including products normally high in fat such as many dairy products) that is consistent with dietary guidelines.

Some comments suggested that the fat content need only be reduced by 25 percent in order to bear the term "light." The comments maintained that such a reduction would ensure truthful and nonmisleading "light" claims. One comment maintained that a 25 percent reduction was appropriate especially since the product was also required to have a minimum absolute reduction in fat of 3 g, which is significant.

A number of comments favored using "light" claims on foods whose fat content is reduced by one-third or more. Some comments suggested that a one-third reduction in fat was significant and would be desirable because it is consistent with a one-third reduction in calories. They maintained that it was easy for consumers to understand the meaning of the term "light" if a food must be reduced by a single percentage of either fat or calories in order to bear the term. One comment suggested that a one third or greater fat reduction would make a valuable contribution towards helping consumers to reduce fat intake.

Other comments stated that products should be reduced in fat by a minimum of 50 percent in order to bear a "light" claim. One comment, which acknowledged that the term "reduced" may have insufficient marketing appeal to encourage industry to create new, healthier products, proposed that "light" replace "reduced" altogether and suggested that the nutrient that is the subject of the "light" claim, for example fat, be reduced by 50 percent or more. Some comments stated that such a revised definition of "light" is desirable because the term "light" is a powerful marketing tool, and by reserving the use of "light" for truly significant reductions, FDA will create an incentive for food companies to develop new products that are nutritionally superior. One comment maintained that a 50 percent reduction in fat is sufficiently substantial to benefit consumers and feasible for industry to achieve. One of these comments suggested that 50 percent or "half as much" is an easy level for consumers to remember. Finally, one comment stated that a consumer study, conducted under their sponsorship by the University of Michigan, suggested that 78 percent of the respondents viewed "light" products to have at least a 50 percent reduction in fat.

The agency has carefully considered all of the comments. Although the agency recognizes the difficulties involved in reducing fat by 50 percent, it is not convinced that they are so great as to prevent manufacturers from producing and marketing a significant number of products with a large enough fat reduction to bear the term "light." The agency notes that the technology problems associated with fat reductions in baked goods would not be pertinent to such products' ability to bear a "light" claim because these products generally do not contain 50 percent of their calories from fat, and the 50 percent fat reduction is, therefore, not required. The same is true for certain savory snacks such as pretzels. A fat reduction is required only for products that derive more than 50 percent of their calories from fat.

The agency is not persuaded by the comments that a 25 or 33 1/3 percent reduction in the amount of fat is sufficient for a food to bear a "light" claim. The comments establish that "light" is a special term with particular marketing appeal, and as such it should have a higher standard than that used for "reduced" and "less" claims which may be used on the label of foods having a 25 percent reduction in fat. The agency believes that the definition for light should take into account consumers' perception of the term as it relates to reductions in fat. One example provided in the comments demonstrates that 78 percent of those surveyed believe that when "light" is associated with fat reduction, it means at least a 50 percent reduction in fat.

As discussed above, the agency believes that a standard for "light" should be higher than that for "reduced" and "less" claims because it would encourage innovation, leading to a greater variety of products with substantial reductions in fat, and thereby help consumers to make significant reductions in the amount of fat in the total diet. Although the agency recognizes that some products would achieve reductions greater than 25 percent if that level were the minimum fat reduction required for products to bear the term "light," additional product innovation will be encouraged because of the desirability of the term, and a wider variety of products with greater fat reductions will, in time, be developed in response to the definition that FDA is adopting. Encouraging the development and marketing of innovative fat reduced foods will provide consumers with a greater variety of foods from which to choose in building a total diet.

In addition, the agency is aware of a variety of currently marketed products, such as cheeses and cheese products, that do have reductions in fat in excess of 33 1/3 and 50 percent, including products that are fat free. With the variety of such products currently on the market, the agency is not persuaded that it is not possible to make and market consumer-acceptable products that are reduced in fat by more than 33 1/3 percent. Furthermore, manufacturers wishing to make and market similar products with fat reductions between 25 and 50 percent will still be able to inform to consumers, through use of the terms "reduced" and "less," that the product did contain a certain percentage less fat than their regular product or other similar products. Although the agency is aware from comments that such terms are less marketable than the term "light," these terms are a method of effectively communicating product changes to consumers.

In summary, FDA concludes that the 50 percent minimum fat reduction is an appropriate criterion for use of the term "light." Accordingly, the agency is retaining this provision in the final regulation.

175. One comment suggested that the term "light" should be permitted on foods whose fat content is 10 percent or less. It noted that this would conform to

the policy of FSIS for the term "light" and would be consistent with FSIS' definition for "lean."

The agency does not agree. Both agencies are developing regulations on use of "light" and "lean." In its Nutrition Labeling of Meat and Poultry Products proposal (56 FR 60302), FSIS adopted FDA's proposed criteria for "light" in place of the 10 percent or less fat content criterion used previously. Because FSIS is no longer using this criterion, the comment that FDA could harmonize the two agencies' policies by adopting the 10 percent or less criterion is not correct. Furthermore, FDA is adopting in this final regulation, FSIS' definition for "lean." Thus, these regulations will provide distinct definitions for both terms. The comment did not present any other rationale to justify its request.

176. Several comments recommended that a food be required to meet the definition of "low fat" to qualify for use of the term "light." One comment referred to a consumer survey that, it claimed, found that many consumers expect "light" foods to have "almost no fat" or "no fat at all." The comment also stated that if foods cannot meet these strict criteria now, "light" should be used only on the few foods that do qualify until food technology developments can achieve the appropriate changes. The comment argued that such an approach would encourage development of products with greater nutrient reductions.

The agency does not agree that a food should have to be "low fat" to bear the term "light." The agency acknowledges that many consumers expect "light" foods to not contribute significant amounts of fat. However, FDA does not agree that the submitted survey substantiates that consumers generally expect "light" foods to have "almost no fat" or "no fat at all." FDA's interpretation of the survey is that some consumers expect a "light" product to have "somewhat less fat" or "one-half the fat." The agency believes that requiring a 50-percent minimum reduction for foods that derive more than 50 percent of calories from fat will ensure that foods bearing "light" claims will not mislead consumers. In addition, FDA is requiring declaration of the percentage of fat reduction on all foods that bear "light" claims, not just those for which the reference foods derive 50 percent of calories from fat (§ 101.56(b)). This declaration will inform the consumer of the meaning of the term for each food that bears it.

The agency also does not agree that overly strict definitions for claims will encourage manufacturers to produce foods with greater improvements in nutrient content. As stated in the general principles proposal with respect to "reduced sodium" claims (56 FR 60421 at 60448), the current requirement for 75 percent sodium reduction is too strict. Consequently, very few foods bear the claim. The agency believes that consumers are more likely to make better food choices if a greater variety of improved foods is available, and if information on the improvement is available. Consequently, FDA is not adopting the suggestion in the comments to require that foods meet the definition of "low fat" to qualify to bear the term "light."

177. A few comments stated that the term "light" should be permitted to be used on products that are "low" in a nutrient. They stated that in the legislative history of the 1990 amendments, Congress said that it considered the term "light" to imply that a product is "low" or "reduced" in fat or calories. Another comment suggested that there are a large number of product labels that have enjoyed longstanding marketing under an interpretation of § 105.66 that "light" means either "low calories" or "reduced in calories," and that the agency should continue to allow the descriptor "light" to mean "low" or "reduced" in any nutrient.

The agency has reviewed these comments and is not convinced that the term "light" should be permitted to be used on products that are "low" in a nutrient. In proposing definitions for terms, FDA tentatively determined that it should provide unique definitions for each of the individual terms that the statute required FDA to define. However, the definitions, while distinct, provide for a range of terms to describe significant levels or differences in levels of nutrients. FDA has been persuaded by the comments that it is appropriate that the terms "reduced" and "less" have the same quantitative definition. However, the agency is not convinced by the comments that it would be appropriate for a product that is "low" in a nutrient to bear a "light" claim based only on the "low" level of that nutrient in the product. On the contrary, as discussed below in comment 179 of this document, a "light" claim is prohibited on foods for which the reference food is "low" in the nutrient. The agency has concluded that "light" implies a difference in nutrient content between two foods. Thus, in general, a reduction in a nutrient that is already "low" is insignificant, and a claim about that difference is misleading. The agency believes that the term "low" should be used to describe the level of the nutrient in such a food.

178. Most comments addressing the issue agreed with FDA's inclusion of calorie reduction as a component of the definition of "light." Most also agreed with the proposed requirement that a food's caloric content be reduced by one-third or more to qualify for use of the term. The comments said that such a reduction was significant and sufficient to justify a "light" claim. However, some comments proposed that the caloric content of a food be reduced by 50 percent or more in order for the food to be labeled as "light." One comment suggested that a 50 percent reduction in calories would be consistent with the level of fat reduction required for "light" claims and would reduce the number of insignificant claims.

The agency is not persuaded by the comments that a calorie reduction criterion for "light" claims other than the proposed one-third reduction is appropriate. The comments did not provide information to substantiate why a 50 percent calorie reduction was more appropriate. The agency discussed the one-third reduction requirement in the general principles proposal in reference to "reduced calories." It noted that because of the ubiquity of calories across all food categories, the reduction in calories in each food necessary to achieve an overall reduction of public health significance could be less than the 50 percent reduction necessary for other nutrients, including fat. Thus, given the difference in the occurrence of the nutrients in the food supply, a 50 percent reduction in fat and a one-third reduction in calories do perform a consistent function in the total diet. Moreover, permitting calorie claims at one-third reduction will allow a greater variety of nutritious foods to bear claims useful in reducing or maintaining calorie intake or body weight.

In addition, FDA has used the one-third reduction in calories as the basis for "reduced calorie" claims in § 105.66 since 1980. In that time, the agency has not found a problem with insignificant reduction in calories in foods bearing such claims. Accordingly, the agency is not revising in § 101.56(b) the percentage of calories that a food must be reduced in order to bear a "light" claim.

179. Many comments disagreed with the proposed requirement for a minimum absolute reduction of 3 g of fat or 40 calories for a food to bear a "light" claim. One comment asserted that the proposed minimum 40 calorie and 3 g criteria would eliminate "light" claims on sour cream, because those

criteria cannot be met while still retaining organoleptically acceptable products. Some comments proposed a minimum absolute reduction of 2 g of fat per serving.

FDA proposed the minimum absolute reduction requirement for "light" claims for the same reason that it proposed a minimum absolute reduction for "reduced" and "less" claims: to prevent claims for trivial reductions in nutrient content. In addition, the objections raised in comments about required minimum absolute reductions for "light" claims have the same basis as those for "reduced" and "less" claims. As was discussed in comment 158 of this document, the agency has become convinced that such a requirement discriminates against those products with small serving sizes, which could not bear "reduced" or "less" claims because they contain an insufficient amount of the nutrient to make the reduction necessary to justify a claim. The agency also was persuaded by the comments that the consumption of several servings of such products (bread for example) over the course of a day would result in significant reductions in the amount of a nutrient when considered cumulatively. Consistent with its position on "reduced" and "less" claims, FDA is persuaded that the minimum absolute reduction in the amount of a nutrient that a product must be reduced in order to bear a "light" claim, namely 40 calories or 3 g of fat, should be deleted. Accordingly, the agency is deleting this requirement from new § 101.56(b).

In addition, consistent with the requirements for "reduced" and "less" claims, the agency considers "light" claims to be misleading on products that base their reduction on reference foods that are already "low" in the target nutrient. As discussed in comment 159 of this document, the agency considers such a reduction to be trivial. Accordingly, the agency has prohibited such a reference food for products bearing a "light" claim in new § 101.56(b)(4).

180. The general principles proposal (56 FR 60421 at 60446) provided that like "reduced" and "less" claims, a "light" claim must be accompanied by a declaration of the percent of nutrient reduction, the identity of the reference food, and the absolute amount of calories and, where appropriate, fat in both the labeled food and the reference food. However, a number of comments suggested that for a "light" claim meaning "reduced calorie" or "reduced fat," a disclosure statement, qualifying statement, or other similar statement, such as the definition of the term, should appear on the label in close proximity to the "light" claim. One comment suggested that such a disclosure statement should incorporate the words "low" or "free" when they are appropriate, and that the disclosure should include a prominent comparison of both calories and fat in the food bearing the "light" claim and in the reference food. Some comments proposed that where a "light" claim is made based on fat content alone, a defining statement such as "light in fat" or "light in fat only," should appear on the label, and where a "light" claim is based on calories, a statement such as "light in calories" or "light in calories only" should appear. Several comments suggested that if a "light" product is not designated as "light" on the basis of reduced fat, it should bear a qualifying statement such as "This product is not lower in fat," and that if the product is not designated as "light" on the basis of reduced calorie content, it should bear a qualifying statement such as "This product is not lower in calories." The comments suggested that this clarification is necessary because many people are uncertain as to whether the "light" claim refers to reductions in fat or calories. Another comment proposed that where a "light" claim is made on the basis of fat content, there should be a prominent calorie disclosure which would list the percent reduction of calories compared to the reference food.

The agency advises that although the general principles proposal required accompanying information for the nutrient that has been reduced (i.e., the percent and the amount, compared to the reference food that the calories and, where appropriate, fat have been reduced), the agency did not propose to require this information for the nutrient that had not been reduced. While FDA has determined that declarations of absolute amounts of fat and calories may appropriately be made on the information panel instead of the PDP (see comment 214 of this document), the agency agrees with the comments that the term "light" may be misunderstood unless it is properly clarified. The agency concludes that because it is permitting the unqualified use of "light" when either a minimum percentage reduction in fat or a minimum percentage reduction in calories is met, but not necessarily both, the specific nature of the reduction for each nutrient must be declared. This declaration is necessary to prevent the term "light" from misleading the consumer into believing that the food has been significantly reduced in both calories and fat when it has not. This modification is in accord with suggestions in comments and is consistent with provisions of sections 403(a) and 201(n) of the act (a label is misleading if it fails to bear a material fact). Accordingly, the agency is modifying new § 101.56(b)(3) to require that the percentage that the fat is reduced, and the percentage that calories are reduced, be declared in immediate proximity to a "light" claim in conformance with the requirements of new § 101.13(j)(2), regardless of which nutrient is reduced by at least the minimum amount required in the definition.

However, the agency has determined that if a labeled product has a sufficiently small amount of fat or calories, so that it complies with the definition of "low" for the nutrient (whether normally or by modification), it would not be misleading if the percentage that the nutrient has been reduced is not specified on the label (see § 101.56(b)(3)(iii)). The absence of such information would not be misleading because the product is "low" in the nutrient and thus would be consistent with any expectations that the consumer might have that the product will be useful in achieving a diet consistent with dietary guidelines.

i. Other nutrients

The agency did not propose a definition for "light sodium" (56 FR 60421 at 60451). It stated that use of the term "light" to reflect a sodium reduction in a food would be misleading on products that were not also reduced in calories and, where appropriate, fat because consumers expected these nutrient reductions in association with the term "light." However, the agency tentatively concluded that the term "light" when used on a salt substitute would not be misleading in view of the long marketing history of these products, and because a salt substitute has virtually no calories and would, therefore, not be expected to be reduced in calories or fat. The agency, therefore, proposed that the term "light" could be used on a salt substitute if the product contained 50 percent less sodium than ordinary table salt.

181. Many comments agreed with the proposal that "light" should be defined for use on salt substitutes. They stated that "light" was an appropriate term on such products because they had essentially no calories. However, some comments stated that "light" would be confusing on a salt substitute because consumers associated the term "light" with reduced calories. Others said th "light" should not be permitted on a salt substitute as an unqualified term if the

product cannot meet the definition for "low sodium." A few comments stated that if "light" is defined for salt substitutes, the amount of sodium in the product should be declared. They said that information on the amount of sodium in a salt substitute is very important for persons who must restrict their salt intake.

The agency concludes that, as proposed, "light" is appropriate for use on salt substitutes. Salt substitutes bearing the term have had a long history of use without apparent consumer confusion. As one comment pointed out, the possibility of confusion is minimized because these products have no calories as well as no fat. Also, the agency is not persuaded that such products should be prohibited to bear a "light" claim if they are not "low sodium," i.e., 140 mg per serving, because such a rule would prohibit "light" claims on most, if not all, sodium reduced salt substitutes. Such a product would have to be reduced in sodium by approximately 85 percent to qualify for the claim.

Further, the agency advises that it recognizes that salt substitutes bearing the term "light" are used primarily by persons who are trying to limit their sodium intake, and that the amount of sodium in such a product is important information. The amount of the nutrient, in this case sodium, that is in the labeled product compared to the reference product (table salt) is required to be stated on the information panel. This statement should provide adequate information for consumers about the amount of sodium in the product. Accordingly, FDA is not changing the proposed provisions for "light" claims on salt substitutes.

182. Several comments suggested that the term "light" without qualification should be permitted for use on foods reduced in sodium. The comments suggested definitions of "nutritionally significant reduction in the amount of sodium" and minimum percentage reductions of 25, 33 1/3, or 50 percent. The comments cited a report of a study by the Calorie Control Council, "Americans Find 'Light' to Their Liking" (Ref. 27), in support of their suggestion that the term "light" should be authorized for use on products that are reduced in sodium. According to the comments, the study demonstrates that 71 percent of those surveyed knew that "light" is used to refer to a variety of product qualities such as lower in calories, fat, cholesterol, or sodium or lighter in texture, color, taste, or weight. The comments stated that their experience suggested that consumers perceive "light" to mean reduced in "more than one macronutrient," and that the term was widely used in the market place. One comment said that "light" should be defined for sodium, so that if a company could not comply with the "light" fat or "light" calories requirements, they would not be prohibited from using the term "light."

Other comments disagreed, saying that "light" claims for sodium should not be defined because consumers associate "light" with calorie content. They suggested that any product bearing the term "light" will be perceived as containing fewer calories and not less sodium. One comment cited a recent Canadian study (Tandemar Research, Inc., Consumer Use and Understanding of Nutrition Information of Food Package Labels (Jan. 1992)), in which only 3 percent of those surveyed volunteered that "light" meant "less salt," as support for its claim that "light" should not be defined to describe a reduction in sodium. Another comment related experience in marketing a product that was reduced in sodium as part of a line of "light" products, saying that there had been a number of complaints from consumers who were confused because they expected the product to be reduced in fat, not in sodium, and consequently the company had dropped the product from the "light" product line.

Another group of comments suggested that "light" should be defined for soy sauce and other low calorie foods that are used primarily as salt substitutes. They said that like salt substitutes, these products also contained virtually no calories. They added that even if a "light" claim on one of these products was misinterpreted to mean "reduced in calories or fat," no harm would come to the consumer because these products had an insignificant amount of fat and calories. Therefore, such a product would not be misleading. Yet another comment suggested that foods that are used in place of salt, but that are not calorie free, should be required to meet a calorie/fat based definition for "light."

The agency has carefully considered all of these comments concerning use of the term "light" without qualification to reflect reductions in sodium. As discussed above, the agency remains concerned that the use of the term "light" without qualification on products that are reduced in sodium but not reduced in fat or calories would be misleading to consumers because of consumers' expectations that a product labeled as "light" has been reduced in fat or calories. The agency has already considered the study by the Calorie Control Council (Ref. 27) and acknowledges that "light" has been used to connote a wide variety of meanings, such as reduced sodium and lighter in texture, color, or weight. However, the same study suggests that controlling calories (85 percent of respondents) and fat (83 percent) were two of the major reasons for use of "light" products. In addition, the report of the Calorie Control Council summary used by FDA stated that 69 percent of those surveyed cited "lower in calories" as the first response when asked the meaning of the term "light." Clearly, although consumers do consider that "light" can mean "light" in sodium, they are primarily concerned with fat and calorie reductions in "light" products. Therefore, the agency remains convinced that "light" claims without qualification on products would be misleading if the product did not have significant reductions in fat or calories. Accordingly, the agency is not providing a definitions for "light" for use on all products having only reductions in sodium.

However, on careful consideration of the comments, the agency is persuaded that, like "light" claims on salt substitutes, "light" claims without qualification on sodium reduced products containing only a few calories and little fat (i.e., a "low calorie," "low fat" food) are not misleading to consumers and can assist consumers in maintaining healthy dietary practices. The food meets the expectations of the consumer that the product is useful in achieving a diet consistent with dietary guidelines for calories and fat, albeit because the food was normally low in fat and calories rather than low in fat and calories by modification. Consequently, the agency has determined that if the sodium content of a "low calorie," "low fat" food has been reduced by 50 percent, it may appropriately bear an unqualified "light" claim. This determination is consistent with the suggestions in the comments and the definition proposed for "light" on a salt substitute. Further while other percentage reductions were suggested, no justification for any of those other reductions was provided in the comments. Accordingly, the agency is providing for this use of "light" as a 50 percent reduced sodium claim in § 101.56(c).

183. A few comments suggested that "light" sodium claims would not be misleading if a disclosure statement such as "this product is not lower in fat or calories" or other qualifying information about the nature of the modification was specified adjacent to the term. One comment cited the findings from the Calorie Control Council's study that 67 percent of those

responding believe that "light" is appropriate to differentiate product qualities so long as the term is clearly explained.

The agency has carefully considered these comments. Given the significant traditional association between the term "light" and sodium content, and the dietary guidelines that suggest a reduction in sodium intake (Ref. 7), FDA has concluded that while an unqualified "light" claim for sodium would generally be misleading, it is appropriate to provide for such a claim with respect to sodium content for use on foods that contain more than 40 calories and 3 g of fat per reference amount if the claim is appropriately qualified. The agency has determined that such a claim can be used to highlight a large, that is, a 50 percent or more, reduction in the sodium content of such food. Such a requisite reduction is consistent with the definition of "light" for fat and for sodium on foods that contain less than 40 calories and 3 g of fat per reference amount.

Therefore, to ensure that this additional "light" claim for sodium does not mislead or confuse consumers, FDA has concluded that it is necessary to tightly limit the circumstances in which it may be used. Thus, FDA is requiring in § 101.56(c)(2)(i) that this use of the term "light" must be qualified to distinguish it from the unqualified use of the term that describes reductions in fat or calories. The qualified term that FDA is defining is "light in sodium." Second, to convey to consumers that "light in sodium" is a single term, and to ensure that a misleading impression is not created by manipulations in type size, FDA is requiring in § 101.56(c)(2)(i) that the entire term be presented in uniform type size, style, color, and prominence. Consequently, if a manufacturer wishes to use the term "light" in a brand name to describe a reduction in sodium, the qualifying phrase "in sodium" or the statement "light in sodium" must appear in immediate proximity to the term "light," in uniform type size, style, color, and prominence.

Therefore, in § 101.56(c)(2), FDA is providing for a qualified "light in sodium" claim when there has been at least a 50-percent reduction in sodium content of a food as compared to an appropriate reference food (see § 101.13(j)(1)). In addition, for reasons that are similar to the discussion in comment 179 with respect to light claims for foods that are low in fat or calories, the agency believes that a "light in sodium" claim on a food whose reference food is already "low in sodium" would be misleading. Therefore, in § 101.56(c)(2)(iii) the agency is prohibiting such a claim except for meals and meal-type products (see comment 272).

184. A few comments suggested that "lightly salted" should be permitted, particularly for use on nuts. The comments suggested that the definition should be either one-third less added sodium or 140 mg of sodium per serving ("low sodium"). The comments said that because of a long history of use, consumers were familiar with the term "lightly salted." The comments also stated that "lightly salted" was an easy way for consumers to identify products with less added salt. One comment requested an exemption for "lightly salted nuts," saying that it would be similar to the "sugar free" exemption proposed for chewing gum.

The agency agrees with the comments that "lightly salted" is a claim long used, for example, on nuts, to mean that less salt has been added to the labeled product than to the regular product. In this sense, it is used as a relative claim. As such, "lightly salted" may be an appropriate term to reflect such a salt reduction. However, to be consistent with the other uses of the term "light," the agency has determined that the product must have at least 50 percent less added sodium than the regular brand. In addition, as discussed in comment 75 of this document, the agency has determined that a claim of "no added salt" would be misleading on products that are not sodium free, unless the label has a statement "Not a sodium free food" or "Not for control of sodium in the diet." Consistent with that determination, a comparable disclaimer, i.e., "Not a low sodium food," must be placed on the information panel of "lightly salted" products that are not "low" in sodium. This disclaimer will assist the consumer who may wish to control his or her sodium intake by consuming the labeled product rather than the regular version of the product from being misled into thinking that the labeled product is "low" in sodium when it is not. In addition, because this is a relative claim, the appropriate accompanying information, as specified in § 101.13(j)(2) is required. Accordingly, the agency has provided for "lightly salted" in § 101.56(g).

185. A few comments suggested that "light cholesterol" should be defined. The comments suggested definitions ranging from the criteria for "low cholesterol" to 50 percent less cholesterol. They said that to ensure such a claim was not misleading, the statement, "this product is not lower in fat or calories" could be added to the claim. However, the comments provided no justification as to why the agency should promulgate such a definition other than the finding from the Calorie Control Council Study cited previously that "light" has been used to refer to products lower in cholesterol.

The agency is not convinced by the comments that a "light" claim is appropriate on products that are reduced only in cholesterol. As discussed above in comments 170 and 182 of this document, consumers most associate "light" with reductions in fat, calories, and in certain respects, sodium. There is not the same strong association between "light"and cholesterol content. Although the report on the Calorie Control Council study mentions cholesterol as one of many qualities with which the term "light" has been associated, the report does not provide a basis to distinguish cholesterol from these other qualities as it does with fat, calories, and sodium. Thus, the agency does not consider the mention of cholesterol in the Calorie Control Council report to provide adequate justification for a "light cholesterol" claim. It does not establish a particular association between "light" and cholesterol reduction. Consequently, the agency is not providing a definition for "light" for use on products that are reduced only in cholesterol.

186. A few comments also suggested that "light saturated fat" should be defined. The definitions suggested for this term ranged from "a nutritionally significant reduction in the amount of saturated fat" to 50 percent less saturated fat. There was no justification other than the report of the Calorie Control Council's study.

As with cholesterol, the agency is not convinced that a "light" claim is appropriate on products that are reduced only in saturated fat. In the report of the Calorie Control Council Study used by FDA (Ref. 27), saturated fat is not specifically mentioned as a quality associated with use of the term "light." Consequently, the agency has no basis to determine that consumers perceive "light" to mean reduced in saturated fat. Lacking any other justification, the agency is not persuaded that use of "light" is appropriate on products that are reduced in saturated fat.

187. A few comments suggested that "light sugar" claims should be permitted. One comment stated that a "light sugar" claim should be defined to mean that the food had 25 percent less sugar and at least 5 g less sugar than the appropriate reference food. Other comments stated that "light sugar"

should be defined to mean 50 percent less added sugar. However, none of the comments provided a rationale for why "light sugar" should be defined.

The agency has reviewed these comments and is not convinced that there is sufficient reason to provide a definition for this term. The agency has determined that definitions of "light" for nutrients other than calories, fat, and, on certain products, sodium would be misleading. In addition, although the agency has not defined "less added sugar," the term "less sugar" could be used to communicate changes in the amount of sugar in the food of the sort that could be communicated if the agency adopted the suggested definition for "light sugar." However, lacking an adequate justification for the term "light sugar," the agency is not convinced that such a definition should be established. Accordingly, the agency is not providing for a definition for this term.

ii. Other uses of the term "light"

In the general principles proposal (56 FR 60421 at 60451) the agency proposed that the unqualified use of the term "light" not be permitted on the label or in labeling of a food unless the term was used to describe a reduction in calories and, where appropriate, a reduction in fat (discussed above) or on a salt substitute that contained at least 50 percent less sodium than salt. However, the agency proposed that the term "light" could also be used to describe physical or organoleptic characteristics of a food so long as that attribute adequately qualified the term "light," e.g., "light in color" or "light and fluffy," and was in the same type size, style, color, and prominence as the word "light" and in immediate proximity thereto. The agency also proposed that if the term "light" had been associated through common use with a particular food, such as "light brown sugar," to the extent that the term "light" had become part of the statement of identity, such use of the term would not be considered a nutrient content claim.

188. A majority of those commenting on the subject had no objections to products bearing the term "light" to refer to other physical or organoleptic properties of a product, so long as that property was specified. They said that in these circumstances, consumers are aware of the meaning of the term "light." However, a few comments objected to allowing such "light" claims. One stated that use of the word "light" to describe color, texture, or taste may mislead some consumers and undermine credibility of the term.

The agency acknowledges that the term "light" has at times been used in describing the physical characteristics about a product without appropriate qualifying information. An example of such a claim is "light" used to describe an oil that is "light" in color but is not altered in nutrient quality. This use is clearly misleading. However, the agency is not convinced by the comments that a claim using the word "light" to describe a physical or organoleptic property, if it adequately characterized the nature of the claim, such as "light in color" or "light and fluffy," would be misleading because the word "light" would be defined as part of the claim. In new § 101.56(e)(2), FDA is requiring that product attribute in question (e.g., the color or the fluffiness of the product) be placed in immediate proximity with the term "light." Accordingly, the agency concludes that its regulations provide adequate assurance that this type of claim will not be abused, and therefore, it is adopting the provisions (new § 101.56(e)) that provide for such claims as proposed.

189. Several comments agreed with the proposal that the physical or organoleptic properties of the food that are described in such claims should be identified immediately adjacent to, and in the same type size, style, and color as, the word "light." One comment said that without this requirement, the claim would be misleading, and the same uses of "light" that exist in today's marketplace will be perpetuated, undermining the basic purpose of the 1990 amendments. However, other comments objected to this type size requirement, saying that the attribute information should not be required to be the size of the claim. Suggestions were that the attribute should be in type one-half the size of the word "light," one-half the size of the brand name, one-half the size of the name of the food, or as prominent as the statement of identity. Another comment said that there should be no type size or placement requirements for the defining attribute. Another comment said that the graphics requirement for this information was so unreasonable and burdensome as to constitute a virtual prohibition for use of the term.

The agency has considered these comments and is persuaded that the type size requirements proposed for the information that defines a "light" claim about a physical or organoleptic property of a product would be burdensome, and that this information need not be as large as the claim to effectively clarify the physical or organoleptic properties of the labeled product. However, because of the special nature of the term "light," and the great potential for its misuse, the agency believes that it is essential that this defining information be declared adjacent to the term, and that the word "light" not have undue prominence relative to this information. The agency believes that to severely diminish the size of the defining information, or to remove it spatially from the claim, would affect the ability of the information to clarify what might otherwise be a misleading claim. FDA concludes that by permitting such information to be as small as half the size of the term "light," it will eliminate the burdensomeness of the proposal and yet still insure that the information was sufficiently prominent so as to mitigate any misimpressions caused by the use of this term. Accordingly, the agency is revising § 101.56(e)(2) to permit the defining information to be one-half the type size of the word "light."

190. Of those commenting, a majority agreed that if the term "light" had, through common use, come to be part of the statement of identity (e.g., "light brown sugar"), the term "light" need not be further defined or qualified. However, a few comments disagreed. They said that all such physical or organoleptic uses of the term should be specifically clarified no matter what the history of use of the term was. Another comment stated that this provision should be narrowed in scope so that this unqualified usage of the word "light" would be limited to situations in which the term reflected physical or organoleptic properties of the food, such as color or weight and not nutritional qualities.

The agency advises that the provision in proposed § 101.56(f) was intended to apply only to use of "light" to describe physical and organoleptic properties of the food. It was not intended to permit uses of "light" that are contrary to other parts of the regulation. Accordingly, FDA has modified new § 101.56(f) to clarify the permitted use of the term. Where the word "light" has come to be part of the statement of identity through longstanding use of the term, it is generally used to characterize a product not in comparison to a regular product, but to a contrasting version of the product e.g., "light brown sugar" versus "dark brown sugar." Without use of the term "light" to distinguish the food from its counterpart, there would be confusion as to the specific identity of the product. Therefore, the agency concludes that for such products, the word "light" is fundamental to an understanding of the product's identity. Consequently, in such circumstances, FDA is allowing, under § 101.56(f), the

use of the term "light" without qualification other than the other components of the identity statement.

191. Another comment suggested that because of a 60-year history of use, the term "light," without qualification, should be allowed on a particular brand of fruit cake to differentiate it from the "dark" version of the same brand of fruit cake.

The agency agrees that it would be appropriate in this long standing situation, for the manufacturer to use the word "light" without qualification to differentiate a version of a particular brand of fruit cake that is "light" in color from a version of the same brand of fruit cake that is "dark" in color. However, FDA advises that for this use the term "light" must appear in the statement of identity, e.g., "light fruit cake." In addition, FDA would expect the dark version of the product to be labeled "dark fruit cake," so that the terms "light" and "dark" have the same conspicuousness on the label. The agency believes that such a use is not misleading to consumers because it is clear from the relative use of the terms "light" and "dark" that the word "light" in this instance refers to the color and not to any other properties of the fruit cake.

192. One comment requested that the agency clarify and codify the method for a manufacturer to demonstrate that its use of the term "light" on a product is permissible because the term has come, through long use, to be part of the statement of identity.

The agency believes that the situations in which such a demonstration would be appropriate are sufficiently few that specific provisions are not necessary to implement this procedure. When the use of the term is broadly applicable to a class of products, a petition would be appropriate. There is provision in part 10 (21 CFR part 10) for this type of request. However, the agency does not believe that it is generally necessary to submit a formal petition to address this matter. Except for those regarding brand names, petitions are broadly applicable to a class of products and do not address a single manufacturer's product. If a manufacturer wishes to have advice on whether a product's use of the term "light" in its statement of identity is appropriate, the manufacturer may submit to the agency evidence to substantiate the longstanding, nonmisleading use of the term for this purpose. The agency will review each situation on a case-by-case basis and notify the manufacturer whether the label declaration is appropriate.

193. Another comment asked for advice on whether its brand name "Sunny Delight" was subject to the requirements for "light" nutrient content claims.

The agency advises that the term "Sunny Delight" would not, by itself, constitute a nutrient content claim. The ordinary meaning of the word "delight," as long as it is presented as a single word without any use of printing, hyphenation, or spelling that unduly emphasizes "light," does not state or imply the level of a nutrient. However, FDA also advises that it will evaluate label statements using forms of the word "light" to determine if they are used in a context in which they make claims that a nutrient has been reduced in the food.

iii. Additional terms

194. One comment stated that additional terms such as "extra light" or "ultra light" should be defined. They said that the state of California allows these definitions to describe reductions in milk fat and urged the agency to define "light" with enough flexibility to allow this labeling to continue. The comment said that "extra light" should be defined as a two-thirds fat reduction, and that "ultra light" should have no fat (a 100 percent fat reduction) compared to whole milk.

The comments have not provided sufficient justification for the terms "extra light" or "ultra light." Therefore, the agency is not providing definitions for those terms at this time. The agency is not persuaded that the consumer would understand the differences among "light," "extra light," and "ultra light," especially since definitions for such terms would be available for use on a wide variety of food. In addition, the comment did not present justification for establishing an additional definition for use on foods that appear to qualify for "low fat" and "fat free." The agency advises that, under new § 101.69, the person who submitted the comment, or any other interested party, may submit a petition to the agency, with substantiating information, requesting definition for these terms.

195. A few comments disagreed with the idea of defining "light" and "lite" as synonyms. One comment suggested that sound alike spellings for "light" (e.g., "lite") should be prohibited. Another comment suggested that the term spelled "l-i-t-e" should be used to refer to calorie reductions and the spelling "l-i-g-h-t" should refer to other product qualities.

The agency does not agree that the terms "lite" and "light" should not be synonymous. The agency points out that the statute required that the agency define "'light' or 'lite'" (section 3(b)(2)(A)(iii)(III) of the 1990 amendments). From this instruction, the agency can reasonably conclude that Congress intended that the two spellings of the term be synonymous. Further, under the statute, to not define both of these terms, the agency would need to find that one of them was misleading under section 403(a) of the act. The comment gives the agency no basis to make this finding, nor is one apparent to the agency. In addition, the agency believes that because of similarity of the terms "lite" and "light," the suggested distinct definitions for the two spellings of the term would cause confusion to consumers and would indeed be misleading. Accordingly, the agency is not changing the status of the terms "light" and "lite" as synonyms.

iv. Dietary Supplement Act

FDA proposed to require in § 101.56(a)(3) that if a food bears a "light" claim, it must be nutrition labeled in accordance with §§ 101.9, 101.10, or 101.36, as appropriate. However, as stated above, the Dietary Supplement Act of 1992 established a moratorium on the implementation of the 1990 amendments with respect to dietary supplements. As a result, FDA is not adopting § 101.36 at this time. To reflect this fact, FDA has deleted the reference to § 101.36 from § 101.56(a)(3). FDA has also deleted references to § 101.36 from §§ 101.60(a)(3), 101.61(a)(3), and 101.62(a)(3).

3. "More" claims

Although the 1990 amendments do not require that FDA define the term "more," the agency proposed a definition and requirements (proposed § 101.54(e)) for use of "more" to describe a food in the general principles proposal (56 FR 60421 at 60453).FDA proposed that a comparative claim using the term "more" may be used to describe a food, including a meal-type product, that contains at least 10 percent or more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or potassium than the reference food that it resembles and for which it substitutes (proposed § 101.54(e)(1)(i)).

Further, the agency proposed that when the claim is based on a nutrient that has been added to the food, fortification be in accordance with the policy on fortification of foods in § 104.20 (21 CFR 104.20) (new § 101.54(e)(1)(ii)). Also, the agency proposed to require that the identity of the reference food, the percentage (or

fraction) that the nutrient was increased relative to the RDI or DRV, and quantitative information comparing the level of the nutrient in the product per labeled serving size with that of the reference food that it replaces be declared in immediate proximity to the most prominent such claim (proposed § 101.54(e)(1)(iii)).

Further, the agency proposed to permit a comparative claim using the term "more" on a food to describe the level of complex carbohydrates in a food, including a meal-type product as defined in proposed § 101.13(l), provided that the food contains at least 4 percent or more of the DRV for carbohydrates than the reference food, and that the difference between the two foods is only complex carbohydrates as defined in proposed § 101.9(c)(6)(i). The identity of the reference food and quantitative information comparing the level of complex carbohydrates with the level in the reference food that it replaces would have had to be declared in immediate proximity to the most prominent such claim (proposed § 101.54(e)(2)).

Finally, FDA proposed to permit a comparative claim using the term "more" to describe the level of unsaturated fat in a food, including meal products as defined in proposed § 101.13(l), provided that the food contains at least 4 percent more of the DRV for unsaturated fat than the reference food, the level of total fat is not increased, and the level of trans fatty acids does not exceed 1 percent of the total fat. Under the proposal, the identity of the reference food and quantitative information comparing the level of unsaturated fat with that of the reference food that it replaces would have had to be declared in immediate proximity to the most prominent such claim (proposed § 101.54(e)(3)).

The agency specifically requested comments on certain specific aspects of the proposed definitions of "more" for describing levels of complex carbohydrates and unsaturated fatty acids (56 FR 60421 at 60453 through 60454). First, both of the proposed definitions deviated from FDA's past requirements for superiority claims which, as stated above, have been based on a food having 10 percent more of the U.S. RDA of a nutrient per serving than the food to which it is being compared. Secondly, the provision in the "more" definition for unsaturated fatty acids limiting the level of trans fatty acids to 1 percent of the total fat was included because the agency believed that it would be misleading for products containing significant levels of trans fatty acids to bear claims of more unsaturated fatty acids in light of recent data suggesting that trans fatty acids act like saturated fat in raising serum cholesterol.

196. A few comments were opposed to the proposed definition of "more." The comments argued that claims for "more" should not be permitted because the 10 percent eligibility criterion is too small to be of significance to consumers. One comment suggested that claims of "more" be expressed in 5 percent increments to prohibit food companies from rounding up to make the increased nutrient level appear greater than it actually is. A few comments stated that the definition for "more" should be similar to the definition for "less," and that the food should contain 25 percent "more" of the nutrient than the reference food to be eligible to bear the term "more." A few comments were concerned that a 25 percent eligibility criterion may lead to over fortification of foods in order to be eligible to bear this term.

The agency has not been persuaded to change the definition for "more." As discussed in the general principles proposal (56 FR 60421 at 60453), the agency believes that a 10 percent greater level of a nutrient relative to the RDI or DRV in a serving of a food is nutritionally significant and is also necessary to ensure that there is truly a difference in the foods being compared. This level is the minimum level of a nutrient that must be provided by a food for the food to meet the definition of "good source" in this final rule. Consistent with this requirement, a food must provide at least an additional 10 percent of the DRV or RDI compared to the reference food before it can be designated as a better source, i.e., having "more" of the nutrient.

The nutrition labeling regulations allow for the standard practice of rounding values to the nearest percent when determining levels of nutrients (new § 101.9(c)(8)(iii)). However there is no provision in the final rule that allows for inappropriate rounding up of values when making claims.

Additionally, the values represented by a "more" claim must be truthful and not misleading. The agency considered requiring at least a 25 percent increase relative to the RDI or DRV as compared to the reference food in arriving at the proposed definition for the term "more." As discussed in the general principles proposal (56 FR 60421 at 60453), FDA rejected this approach because of the agency's concern that a level higher than 10 percent of the DRV or RDI would result in inappropriate fortification of foods in an attempt to make superiority claims. Therefore, the agency is retaining the proposed definition of "more" in the final rule.

197. A few comments disagreed with the proposed requirements for use of the term "more" for complex carbohydrates. The comments generally argued that defining "more" for complex carbohydrates but not defining "high" in this regard is inconsistent, and that further scientific evidence about the benefits of consuming complex carbohydrates is needed.

As discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**, the agency has determined that it cannot presently define, and, therefore is not defining, "complex carbohydrates." FDA has concluded that there is not sufficient consensus about the meaning of the term or appropriate analytical methodology for a specific definition for "complex carbohydrates." Therefore, the agency is not providing for the term "more" for complex carbohydrates in the final rule.

198. Most of the comments disagreed with the proposed definition for "more" for use with unsaturated fat. Most comments expressed the view that "more unsaturated fat" should not be defined until there is more scientific evidence to support the benefits of the claim. The comments were concerned that allowing the claim at this time will confuse consumers about the benefits of increased consumption of unsaturated fat. One comment suggested eliminating the additional criterion for trans fatty acid in the proposed definition because no conclusive evidence exists that trans fatty acids function like saturated fatty acids. One comment requested that the agency define "more" for monounsaturated fat.

The agency agrees that a definition for "more unsaturated fat" is unnecessary. As discussed in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**, the agency has decided not to establish a DRV for "unsaturated fat." FDA has been persuaded by comments that the use of the term "unsaturated fat" is potentially confusing, does not provide useful information, and could result in consumer deception. Therefore, the agency is not defining "more unsaturated fat" or "more monounsaturated fat" in this final rule.

199. A few comments disagreed with the proposed requirement that a food containing added nutrients must be in compliance with the agency's fortification policy to be eligible to bear the term "more" on its label. The comments noted that this policy is only a guideline.

The agency concludes that this requirement is appropriate. As discussed in the general principles proposal (56 FR 60421 at 60453), the fundamental objective of the agency's policy on appropriate fortification of foods is to establish a uniform set of principles that serve as a model for the rational addition of nutrients to foods. While it is true that the fortification policy is only a guideline, in the context of new § 101.54(e)(1)(ii), FDA has subjected the use of § 104.20 (21 CFR 104.20) to notice and comment rulemaking. Interested persons were given notice that FDA intends to use that provision as more than a guideline. Such persons had an opportunity to object to provisions of that regulation and explain why such provisions did not provide an appropriate basis on which to limit the use of "more" on food labels. No comments did. Therefore, the fact that part 104 (21 CFR part 104) is generally intended to be used as a guideline has no significance here.

In that policy, FDA clearly states its concern that random fortification of foods could result in deceptive or misleading claims for foods. In authorizing a claim for "more," the agency is making a finding that the claim will assist consumers in maintaining healthy dietary practices (see section 403(r)(2)(A) of the act). The agency cannot make such a finding for nutrient additions that are not consistent with the fortification policy. Therefore, FDA is retaining the requirement that foods bearing the term "more" comply with the agency's fortification policy.

200. A few comments expressed interest in use of the terms "fortified" and "enriched" as synonyms for "source." The comments were of the view that these terms should be permitted because they are easily understood by consumers as a result of their use in food labeling for many years.

The agency believes that the terms "fortified" and "enriched" are not synonymous with the term "source" but more appropriately may be defined in the same manner as the term "more." "Fortified" and "enriched" convey the meaning that there is "more" or a nutrient in a food compared to another food. This approach is consistent with the agency's fortification policy § 104.20(h)(3), which states that when labeling claims are permitted, the term "enriched," "fortified," "added," or similar terms may be used interchangeably to indicate the addition of one or more vitamins or minerals or protein to a food, unless an applicable Federal regulation requires the use of specific words or statements. Section 403(r)(2)(A)(i) of the act limits the terms that can be used to those provided for by § 101.54(e).

Therefore, the agency is providing, in this final rule, for the use of the terms "fortified," "enriched," and "added" with the same quantitative definition as the term "more" when these terms are used to describe the level of a nutrient that has been added to a food. However, as discussed in greater detail in the section of this document on reference foods, there are circumstances in which the term "more" is appropriately used but "fortified," "enriched," and "added" are not. These circumstances, which are delineated in new § 101.13(j)(1)(i), turn on whether the comparisons are being made to similar (bread to bread) or dissimilar (bread to rolls) foods.

4. Reference foods

a. Reference foods for "reduced" and "less"

201. Many comments suggested that if "reduced" and "less" were defined in the same manner, they should both be permitted to use the same types of reference foods, i.e., a manufacturer's regular brand or a food in a valid data base in addition to an industry-wide norm.

Because the agency has determined that "reduced" and "less" should have the same quantitative definition, the agency believes that it is appropriate for these two terms to be permitted to have many of the same types of reference foods (see new § 101.13(j)(1)(ii)(B)). In many circumstances, these terms can be used interchangeably.

Consequently, the agency has concluded that the manufacturer's regular brand, another manufacturer's regular brand, and a representative value for a broad base of foods of the particular type, are appropriate reference foods for both "reduced" and "less" claims. Accordingly, the agency is providing in new § 101.13(j)(1)(ii)(B) that "reduced" and "less" claims may use as a reference a food or class of foods whose composition is reported in a representative valid data base.

However, as discussed in greater detail in comment 204 of this document, not all reference foods that are appropriate for "less" claims are appropriate for "reduced" claims. Even though these terms are based on the same percent reduction, reductions from a certain class of reference foods, those foods that are different than the labeled food but that would fall in the same product category (e.g., potato chips as a reference food for pretzels) are not appropriately described, simply as a matter of English, by use of the term "reduced." Claims that are designed to draw consumers' attention to such reductions are more appropriately phrased using the term "less." FDA has reflected this fact in new § 101.13(j)(1)(i) and has modified §§ 101.60(b)(4), 101.61(b)(6) and 101.62(b)(4), (c)(4), and (d)(4) accordingly.

In this context, the agency notes that because it has determined that "light" claims should be subject to a more rigorous standard than the other relative claims, it is limiting the reference foods that are appropriate for use with "light" claims. Under new § 101.13(j)(1)(ii)(A), FDA is requiring that the reference for a "light" claim be limited to a representative value for the type of food that bears the claim. This value may be drawn from such sources as a valid data base, an average of the three top national or regional brands, or a market basket norm.

These determinations are explained in more detail in response to the comments that follow.

202. Several comments stated that use of nutrient values from data bases as references for claims should not be limited to the kinds of data bases cited as examples in proposed § 101.13(j)(1)(iii). They suggested that other published or unpublished data bases should be available for use as a basis for claims because established data bases like USDA's Handbook 8 (Ref. 24) are not updated frequently enough to keep up with product innovation. The comments contended that more flexible data bases should be used. In addition, one comment stated that the established data bases are not truly average values because they do not account for variations in preparation of foods. For example, the comment stated, they do not provide the fat content of potato chips cooked in a variety of oils. Some comments requested clarification, including examples of what constitutes a valid data base. One suggested that there is inadequate control over the quality of the data going into a data base.

The agency recognizes the limitations of data bases. Data bases, as they apply to relative claims, are intended to be used to determine representative values for nutrients in a particular type of food for the purpose of determining nutrient differences on which to base a claim. They are not intended to provide all-inclusive nutrient values, such as nutrient values for potato chips cooked in a variety of oils. The agency recognizes that while published data bases, by their nature, are often not up-

to-date, they do provide a reference that is readily available. Further, the agency advises that while USDA's Handbook 8 (Ref. 24) was cited in the proposal as an example of an acceptable data base, it is not the only data base available for use as a reference for relative claims.

On July 23, 1992, the agency published (57 FR 32796) a notice of availability of a draft document entitled "Nutrition Labeling Manual, A Guide for Developing and Using Data Bases." This draft manual has now been subject to review and comment and is being made available in final form with the publication of the regulations. This manual details the parameters that the agency believes to be appropriate for data bases used for nutrition labeling. Because the use of descriptive terms is directly related to these same nutrient values, data derived from data bases, as described in this manual, would be appropriate for use as a basis for relative claims.

203. Some comments said that products that have been improved in order to bear nutrient content claims, especially those meeting the definition of "light," should not be included in data for reference values to be used as the basis for claims. They stated that if nutrient values of improved products were included, some improved products would eventually be disqualified from bearing claims because the data base would change as additional modified products become available.

The agency believes that all improved foods, including those that bear "light" claims, should be considered when deriving appropriate reference foods on which to base claims. To the extent that the claim is based on a reference food that is representative of a particular type of food, for the claim to not be false or misleading, the reference food should fairly reflect the market. Thus, the effect of improved foods on the market must be reflected in the reference food. The agency agrees that this position may well result in a progression of the overall nutrient values of marketed foods in a direction that is consistent with dietary guidelines, but this result is consistent with the 1990 amendments.

204. Some comments specifically supported basing claims on a comparison of dissimilar products within a product category, e.g., potato chips to pretzels. They said that without the ability to make such claims, there would be no incentive for the industry to develop reformulated products. Several other comments suggested that "reduced" claims should not be based on the difference in amount of a nutrient in dissimilar products, such as a potato chip compared to a pretzel, but that such claims should be limited to comparisons between similar products (potato chips to potato chips).

One comment stated that comparisons between dissimilar products could result in consumer confusion and would increase the possibility of misleading claims. The comment said that consumers view a "25 percent less fat" claim as a comparison to another version of the same type of food as the food that bears the claim. It went on to say that unless all products of a particular type (e.g., pretzels) make the same claim, consumers could be misled into thinking that products making the claim are nutritionally superior to those that do not, despite the fact that such claims refer to a different type of food. The comment suggested that if cross-food comparisons are permitted, additional restraints on their use are needed. As an example, the comment asked whether a "reduced sodium" claim could be made for pretzels simply because they contained 25 percent less sodium than potato chips. The comment stated that using the term "reduced" to represent such a comparison could mislead consumers.

The agency has evaluated these comments and is convinced that comparisons using the terms "light" and "reduced" are only appropriate for use in comparing similar foods, e.g., a reformulated version of a manufacturer's product to the original product (potato chips to potato chips). These terms say that there has been a change in the level of a nutrient in a given food and, therefore, are only appropriate to reflect actual changes in the level of a nutrient. Thus, they are not appropriate for use to reflect differences between two dissimilar foods (pretzels to potato chips).

The term "less," on the other hand, can have the same connotation as "reduced" and "light," or it can denote the existence of a difference between two products without implying that there has been a change in nutrient level in the product that bears the term. For example, a "reduced" claim would clearly be misleading under section 403(a) of the act if it were used on the label of a pretzel to describe that the pretzel had 25 percent less fat than potato chips if there had been no change to the pretzel to achieve the difference in the level of the nutrient, and the pretzel bearing the claim was no different than other pretzels. On the other hand, the agency is also convinced that comparisons between products that are dissimilar but within the same product category, and that can generally be substituted for one another in the diet, are useful to point out alternative food choices. This type of comparison can provide the consumer with valuable information useful in making food selections to achieve a diet consistent with dietary guidelines.

The agency does not believe that the consumer will be led to believe that claims comparing dissimilar products are applicable only to the brand bearing the claim because the use of the claim with the reference food, e.g., "25 percent less fat than potato chips," will adequately characterize the claim. Accordingly, the agency in new § 101.13(j)(1)(i)(A) is providing that the term "less" may be used to compare dissimilar foods within a product category, and in new § 101.13(j)(1)(i)(B) is limiting the reference foods for "light" and "reduced" claims to products similar to the product bearing the claim (e.g., potato chips to potato chips).

In addition, the agency points out that the 1990 amendments repeatedly state that claims provided for in this regulation and other regulations promulgated under this statute must not be misleading (e.g., section 403(r)(2)(A)(vi) of the act and section 3(b)(1)(A)(iii) of the 1990 amendments). In these regulations, FDA has attempted to provide clear guidance to manufacturers on how to state claims and on what foods are appropriate as reference foods. However, these provisions do not mandate precise phrasing for each permissible claim. Particularly for use of dissimilar foods as reference foods, the regulation does not specify what "product category" means. The agency has intentionally used a flexible standard. This flexibility is intended to facilitate useful comparisons on foods that are generally interchangeable in the diet (for example, "apples have less fat than potato chips") while prohibiting meaningless or misleading claims. As a consequence, manufacturers will have to use judgment in developing claims to ensure that the claims comply with the regulations and are not misleading under section 403(a) of the act. The agency advises that it will determine on a case-by-case basis whether a claim is misleading because its overall context or presentation is misleading.

205. Several comments stated that in addition to using the nutrient values of a manufacturer's own brand of food as a basis for a "reduced" or "less" claim, similar claims should also be permitted based on comparisons of the product to another manufacturer's brand of the same food. In addition, comments stated that a recognized regional or national brand, with a significant market share,

that is competitive to the product making the claim should also be an appropriate reference food for "reduced" or "less" claims. They said that allowing for brand-to-brand comparisons would provide incentives for development of new products consistent with dietary guidelines.

The agency has evaluated these comments and has determined that use of a competitor's product as a reference food for "reduced" and "less" claims could be appropriate if done in a nonmisleading manner. A competitor's product used for comparison should be an accurate reflection of the products competing with the labeled product. Using a brand of product that is markedly different from the typical foods of the type that includes the labeled food has a great potential to result in a misleading claim. The agency would not, however, consider comparisons between the labeled product and competing products of the type with which the consumer is familiar (e.g., a market leader) to be misleading under section 403(a) of the act unless the competing product is significantly dissimilar in its nutritional attributes.

Accordingly, the agency is providing in new § 101.13(j)(1)(ii)(A) that for relative claims other than "light," another manufacturer's product may be used as a reference food.

206. A few comments suggested that products that had previously been offered for sale but are not currently being sold should be considered appropriate reference foods for products bearing "reduced" and "less" claims. Comments suggested that such a product should be useable as a reference food for up to 6 months or 1 year after being taken off the market.

The agency agrees that it would not be misleading to highlight changes in the formulation of the labeled food, even though the old version of the product is not being marketed. Such claims could be used to point out changes in the level of a nutrient in the new product that would assist consumers in maintaining healthy dietary practices. However, FDA believes that such comparisons to discontinued products should be limited. The agency advises that it would not consider comparisons to such products misleading, provided the labeling for FDA regulated products is attached to that product no more than 6 months after the product has been discontinued from the product line. Any such comparisons after that time would be misleading because of the absence of the old "regular product" for which the new product is a substitute. As the new product replaces the old product, the new product becomes the manufacturer's regular product, thus eliminating the old product as an alternative food choice. Without this alternative choice, the comparison becomes meaningless. In addition, the agency points out that similar time restrictions are appropriate when comparing a labeled product with a competitor's product. In the event that a competitor discontinued a product, the agency believes that claims using that food as a reference would also only be appropriate for 6 months after discontinuation of the product. After that time such claims would no longer be valid because the old product would have become unavailable for consumers either to purchase or to compare.

b. Reference foods for "added," "enriched," and "fortified"

As discussed in comment 200 of this document, the agency is providing for the additional terms "added," "enriched," and "fortified" (referred to collectively for purposes of this discussion as "added"), which will have the same quantitative definition as the term "more."

The agency believes that the difference in meaning between "reduced" and "less," discussed above, also exists between "added" and "more." Comparison of the level of a nutrient between two dissimilar foods using the word "added" is misleading because the term "added" implies that the labeled food is the same as the reference food except for the addition of the nutrient. On the other hand, like "less," the term "more" would not necessarily be misleading in a comparison of two dissimilar foods within a product category that can generally be substituted for one another in the diet. The term "more" states that there is a difference between the two foods but does not imply that difference is a result of modification of the food bearing the term. Accordingly, the agency is reflecting this distinction in new § 101.13(j)(1)(i).

c. Reference foods for "light" products

In the general principles proposal (56 FR 60421 at 60445 through 60446), FDA proposed that an "industry-wide norm" be the only reference for "light" claims. The agency said that because of the special nature of this term, the reference should take into account all foods of a particular product class so as to provide the broadest base and the least opportunity for abuse of the term. The general principles proposal defined an industry-wide norm as "a composite value weighted according to a national market share on a unit or tonnage basis of all the foods of the same type as the food for which the claim is made."

207. A few comments agreed with the concept of an industry-wide norm, saying that maintaining a high standard for the reference for "light" claims would ensure the term's utility, and that such claims would not be misleading. However, an overwhelming majority of the comments that addressed the issue forcefully disagreed with this concept, especially since the industry-wide norm was the only basis proposed for "light" claims. The comments said that the standard of an industry-wide norm was ambiguous and could lead to erroneous comparisons between foods because of the difficulty in deriving such values. Some comments asked who was going to derive the industry-wide norm, while others, recognizing that manufacturers were responsible for label information, said that because of the difficulty in deriving the industry-wide norm, different manufacturers were likely to reach different nutrient values for similar foods. The comments said that the industry-wide norm was: (1) Too complicated to derive because it encompassed 100 percent of the foods of a particular type; (2) excessively restrictive; and (3) prohibitively expensive because of the cost involved in obtaining all the necessary marketing and nutrition information. The comments went on to say that an industry-wide norm is impractical because of frequently changing formulations, variations in products from region to region, and wide variations within certain food types even within a region.

The agency has reviewed the comments and has concluded that requiring use of an industry-wide norm as proposed would be impracticable because of the amount of data needed to include 100 percent of the foods of a particular type, because such data are not always available and because of frequently changing formulations and product variation. In addition, the agency acknowledges that the cost of acquiring such data would be very high. Accordingly, the agency finds that using the proposed industry-wide norm as a reference is unworkable and is deleting the requirement from new § 101.13(j)(1)(i).

However, because an industry-wide norm was proposed as the sole reference for products making "light" claims, as explained in response to the comments that follow, the agency has developed alternative references for "light" foods.

208. Several comments suggested that a manufacturer's own brand or another version of the food from a different manufacturer or competitor should be

an acceptable reference food for a "light" claim. They said that this reference food is appropriate especially when the labeled food was a "light" version of an existing product.

The agency disagrees. As stated in the proposal, FDA believes that for "light" claims, comparisons to a single food in a product class may be misleading, particularly when the reference food differs significantly from the norm for the product class and contains the nutrient at a level that is at the extreme end of the range for the product, e.g., deluxe chocolate chip cookies. Using such a single product as a reference for a "light" claim would result in skewed comparisons in which a product that would normally be considered average for the product type could qualify to make a "light" claim. Clearly such a claim would be misleading to a consumer who, based on it, concludes that the labeled product has 50 percent less fat or one-third fewer calories, than similar foods of the same type.

Because the comments did not provide information to persuade the agency that a provision permitting use of single foods as references for "light" claims will not result in misleading claims, the agency does not consider a manufacturer's own product to be an appropriate reference food for a "light" claim.

209. A few comments stated that the reference for "light" should be based on a market basket norm or a less comprehensive version of the industry-wide norm, e.g., 70 percent of market volume instead of 100 percent of the product.

Although these alternatives are less comprehensive than the 100 percent of the market share based industry-wide norm, they still present problems in their derivation, either because the marketing data collection and nutrient analyses are expensive, especially for small manufacturers, or because they are almost as difficult to derive as the industry-wide norm. Therefore, the agency concludes that such a comprehensive standard is too burdensome to be required as a reference food for products bearing the term "light" and will, therefore, not compel manufacturers to use such a high standard for a reference. However, the agency believes that these composite values would in all likelihood be representative of the market and thus would be an appropriate representative reference for a product bearing the term "light." While the agency is not requiring these specific references, it encourages manufacturers to use them where feasible.

210. Other comments stated that values from a valid data base would be appropriate references for "light" claims.

It is possible that nutrient levels from a data base can provide the appropriate reference against which "light" comparisons could be made. A data base is an appropriate reference if it is representative of the nutrient values for foods that are similar to the food for which the claim is being made and that are currently on the market (see Nutrition Labeling Manual, A Guide for Developing and Using Data Bases). However, the agency cautions that broader, general data bases such as USDA Handbook 8 (Ref. 24) may not be representative of a single food because they may not represent the current market, especially when such data are for a rapidly changing food category such as bakery products or snack foods. Therefore, such data bases should be used with caution.

211. Several comments suggested other types of references for use with "light" claims, such as a leading national brand (e.g., one of the top three brands or a brand with 5 percent or more of the market share), or a top regional brand (for that region only). Comments noted that there needs to be a reference for manufacturers to use who only sell "light" products.

As discussed in comments 209 and 210 of this document, FDA is concerned that when a "light" claim is made, it be based on a reduction in the amount of the nutrient in the product compared to the level of that nutrient in a reference food that is accurately reflective of the foods of that specific type of food on the market. For example, if a "light" claim were made on chocolate ice cream, the agency would expect that reference the nutrient levels would not be derived exclusively or disproportionately from nutrient values from high fat or premium chocolate ice creams. Such a claim would clearly be misleading.

To the extent that values such as those suggested in the comments are representative of the market place, they would be appropriate references for "light" products. The leading national or regional brand also might be an appropriate reference food if the food is firmly and convincingly established as the market leader. However, if there were two market leaders with widely different nutrient profiles, selecting the one with the slightly higher market share for comparison could be misleading.

In summary, the agency has determined that any food or group of foods would be appropriate as a reference for a "light" product if their nutrient levels are convincingly reflective of a broad base of foods of the type that includes the product bearing the claim. Accordingly, the agency is revising new § 101.13(j)(1)(ii)(A) to provide that the reference for a "light" claim must be nutrient values for a food or group of foods whose nutrient values are accurately representative of a broad base of individual foods of the same type as that bearing the claim, e.g., an average value determined from the top three national (or regional) brands of the food, a market basket norm, or from a representative valid data base.

However, when claims are based on reference nutrient values derived from one of a variety of sources, most of which may be unknown or generally unavailable to the average consumer, the agency is concerned that in order for consumers to fully understand such claims, the basis upon which the reference nutrient values are derived be available to consumers on request. Individual reference foods are identified with the claim and thus the reference nutrient value derived from that food would be available by checking its nutrition labeling. In contrast, broad based reference nutrient values derived form average values, market basket norms, data bases, and similar sources are not ordinarily readily available to the public. Therefore, to fully inform consumers, firms that use a broad based reference nutrient value as a basis for a claim must be prepared to make information on how they derived the reference nutrient value available to consumers on request. In addition, the information must also be made available to appropriate regulatory officials on request. This additional requirement will assist regulatory officials in determining compliance with the requirements for appropriate reference nutrient values for products bearing a claim to ensure the claim is not false or misleading. Accordingly, the agency is providing for this requirement in new § 101.13(j)(1)(ii)(A).

5. Accompanying information

In the general principles proposal (56 FR 60421 at 60446), the agency stated that relative claims would be misleading unless they are accompanied by certain material facts that are necessary for consumers to understand the comparisons that are being made. The agency tentatively concluded that the percent and amount of difference of a nutrient in the labeled product compared to the reference food are material facts under sections 403(a) and 201(n) of the act. The agency proposed that this information accompany the relative claim that is in the most

prominent location. The agency also proposed that this information be in type size no less than one-half the size of the claim but no less than one-sixteenth of an inch.

212. A number of comments agreed with the proposed requirement that for a food to bear a relative claim, the product to which the food is being compared must be identified on the label. They said that naming the reference food provides information about the basis on which the claim is made and makes the other required information relevant. In addition, a majority of the comments agreed that the percentage (or fraction) that a nutrient in a product is changed should also be stated. However, a few comments stated that none of this type of information was necessary.

Because the latter comments did not present information to support their assertion, the agency concludes, that consistent with the proposal, the percentage difference of the nutrient compared to a reference food and the identity of the reference food are facts material to the claim under section 201(n) of the act. Without this information the consumer cannot fully evaluate the claim or understand the utility of the food that bears the claim in maintaining healthy dietary practices. Therefore, a claim without declaration of the percentage difference and the identity of the reference food would be misleading under section 403(a) of the act. Accordingly, the agency is retaining this requirement.

213. The comments were less in agreement regarding the necessity of retaining information about the amount of the nutrient in the product compared to the amount in the reference food. Although many comments agreed that this information was useful in assisting a consumer to evaluate the claim and to understand the role of the food in maintaining healthy dietary practices, many felt that the information was not necessary because it could be ascertained from other information on the label, such as the percentage that the nutrient in the labeled food was different from that in the reference food. Others stated that the amount of the nutrient in the labeled food compared to the amount in the reference food was redundant of the information indirectly provided by the minimum difference in the amount of the nutrient that must be achieved for the food to qualify to bear the claim.

The agency has reviewed these comments. FDA finds that a quantitative comparison between the labeled food and the reference food is not a redundant requirement. First, as explained in comments 158 and 179 of this document, the agency is not retaining the requirement of a minimum absolute reduction from the reference food because the agency has concluded that such a requirement is not necessary to ensure the validity of the claim and would only serve to deprive consumers of useful information. Consequently, the amount that the nutrient has been reduced will not be redundant of the definition of the claim. In addition, the amount of the nutrient in a food compared to the reference food is not readily discernable from the other information on the label but would be attainable only by a mathematical calculation using the percentage reduction and the nutrition information. Consequently, the agency concludes that the stated amount of the nutrient in the labeled product compared to the amount in the reference food is necessary for consumers to fully and easily evaluate and understand these claims and for it to be useful to them in maintaining healthy dietary practices. Therefore, the agency is retaining this requirement.

214. Several comments agreed with the proposed requirement that the accompanying information be adjacent to the most prominent claim. However, others disagreed. Some stated that the accompanying information should appear wherever the claim is made. A few comments suggested that it should be permitted to be located next to any claim. Others objected to any specific provisions and recommended that there be a general requirement that accompanying information appear prominently and conspicuously. Still others stated that the information could be placed on the information panel with a notation, for example an asterisk, on the PDP to encourage consumers to turn the package to the information panel for the accompanying information.

A larger number of comments took a different approach and suggested that requiring declaration of the absolute amounts of the nutrient in addition to the identity of the reference food and the percentage difference in the nutrient between the two foods resulted in too much information being required to directly accompany the claim. They stated that this information adds to label clutter on the PDP. Comments said that this provision would make it difficult, if not impossible, to provide information necessary to market the product, especially for multi-language labels. They suggested that all or part of this information, particularly the absolute amount of the nutrient in the product compared to the reference food, should be placed on the information panel. On the other hand, other comments suggested that the amount of the nutrient in the labeled food compared to the reference food was more important than the other accompanying information, and it should be retained on the PDP.

The agency has reviewed these comments and has reconsidered the proposed requirement that all the accompanying information be next to the most prominent claim. FDA evaluated the need for each of the three components of the explanatory information for the consumer to understand the claim at the point of purchase and has concluded that because the relative claim describes a difference in nutrient content between two foods, the identity of each food is essential for the consumer to understand the claim. In addition, a description of the difference in nutrient content between the two foods is needed with the claim because such a description actually defines the relative claim. The agency concludes that the most readily understood description of the difference between two foods is the percentage difference. Therefore, the percentage difference in content of the nutrient appropriately appears with the claim. Accordingly, new § 101.13(j)(2)(i) of the final regulation requires declaration of the identity of the reference food and the percentage difference in content of the nutrient to accompany the most prominent relative claim on the PDP.

However, FDA concludes that the declaration of the absolute amount of the nutrient in each of the two foods provides the type of quantitative information that generally appears on the information panel, and that, therefore, the absolute amount declaration need not directly accompany the claim. In fact, while the absolute amount declaration is a material fact under section 201(n) of the act, FDA finds that it is consistent with the scheme in section 403(r)(2) of the act to place this information on the information panel in conjunction with nutrition labeling. Specifically, if a food that bears a nutrient content claim contains another nutrient in an amount that exceeds the applicable disclosure level, section 403(r)(2)(B)(ii) of the act requires that that nutrient be highlighted in conjunction with the claim, and that the consumer be referred to the information panel for quantitative information about that nutrient. Here, analogously, the comparative percentage differences are to be set forth with the relative claim, and the referral statement will guide the consumer to the information panel for the relevant

quantitative comparison. Accordingly, FDA has revised new § 101.13(j)(2)(iv) to permit declaration of the absolute amount of the nutrient in each food on the information panel. Of course, a manufacturer is free to place this information in direct proximity with the claim.

FDA disagrees with comments that requested that all accompanying information be declared with the claim each time it is stated on the label. In the general principles proposal, the agency tentatively concluded that the consumer will likely read the most prominent claim at the point of purchase, and that if the essential information is declared near that claim, the consumer will receive adequate explanation of the meaning of the claim.

The comments did not explain why this presentation is inadequate. In addition, requiring that accompanying information appear with every claim would add considerably to label clutter. FDA agrees with the many comments that stressed that label clutter should be minimized to the extent possible. The agency concludes that requiring that the information accompany the claim each time it appears would reduce the readability of the label while providing no additional information. Therefore, the agency is not adopting such a requirement.

Finally, FDA concludes that requiring an asterisk on the PDP to guide the consumer to the amount of nutrient information on the information panel is not necessary. The referral statement required to accompany all nutrient content claims (new § 101.13(g)) will be on the label and will direct the consumer to the information panel. Additional referrals to the information panel would be redundant.

215. One comment stated that while the percentage the nutrient differs compared to the reference food and the referral statements were appropriate for single nutrient claims, this same information for multiple claims would clutter the PDP.

The agency recognizes that multiple claims would require more information on the PDP. However, because the absolute amount of the nutrient compared to the reference food will no longer be required to be on the PDP, and because § 101.13(g) requires that there be only a single referral statement when multiple claims are made on the same panel, the label information required to be on that panel is considerably lessened. In addition, although not required, a single reference food will likely be used when multiple claims are made on a particular product. Use of the same reference food will considerably reduce the amount of information on the label. In addition, in light of the changes that the agency is making in this final rule, the percentage that the nutrient has been changed will often be part of the claim, e.g., "25 percent reduced fat cheese cake." Therefore, the agency concludes that no additional changes in declaration requirements are necessary for multiple nutrient claims.

216. Several comments suggested that the percentage declaration that accompanies the claim be in the same type size, style, and color as the rest of the claim. However, many other comments suggested that the proposed type size requirement would make the declaration too large and would leave insufficient label space to effectively convey information about the product. To substantiate this contention, the comments provided mock ups of labels showing how the type size requirements would lead to label clutter. They requested that the type size be reduced.

The agency considered these comments and examined the label examples that were submitted. As a result, the agency has become convinced that the type size requirements for accompanying information may so crowd the PDP that manufacturers may not be able to effectively communicate needed information to the consumer. Therefore, the agency has determined that a different type size requirement is appropriate for this information. Because the accompanying information is adjacent to (although preceding) the referral statement and, like the referral statement, is used to clarify the claim, the agency concludes that the accompanying information should be subject to the same type size and style requirements that it has prescribed for the referral statement. Therefore, the agency in new § 101.13(j)(2)(ii) is cross-referencing the type size requirements in new § 101.13(g)(1) for referral statements. Thus, the accompanying information will be in the type size required by § 101.105(i) for net contents declaration or one-half the size of the claim, as appropriate, but in no case less than one-sixteenth inch.

217. A few comments suggested that the labeling disclaimers for substitute foods that do not have the same performance characteristics as the original food, e.g., "Not for use in cooking," be required on foods that bear "light" claims as well those that bear "reduced" claims.

The agency advises that the requirement for performance characteristic labeling for substitute foods applies to all foods that bear claims that they may be used interchangeably with another food. Therefore, the disclaimer requirement in § 101.13(d) will apply equally to any food in which a nutrient level has been changed and that bears a nutrient content claim including "free," "low," "reduced," "less" (or "fewer"), "light," "more," and "added."

6. Modified

218. Of those commenting on the term "modified," most agreed with the proposed use of the term. However, one comment stated that the term "modified" does not explain whether the nutrient has been reduced or augmented. Another comment suggested that the word "modified" used to compare dissimilar products would be misleading and recommended that foods bearing the term "modified" as part of the statement of identity not be allowed to use a dissimilar food as reference food. It said that a food labeled "modified" should be required to be actually changed as compared to other foods of its type. A few comments said that "modified" should be used only to distinguish chemical changes in a food or to refer to the nutrient character of the food (e.g., "modified fat" or "modified food starch"), not to a change in the amount of a nutrient. A comment suggested that "adjusted" should be used instead of "modified." Another comment suggested that the term "modified" was unattractive for marketing purposes.

The agency points out that the term "modified" is not meant to be used alone, nor was the term meant to be used to describe products that had not been altered. Therefore, as discussed in comment 204 of this document, the term will not be permitted based on a comparison to a dissimilar product.

Additionally, because the word "modified" reflects a change in the food, the reference food used for the "modified" would be one that was appropriate for a "reduced" or "added" claims. For example, a modified fat cheddar cheese would have as its reference a full fat version of cheddar cheese, not some other cheese.

The comment suggesting "adjusted" did not provide any basis to believe that this term is more useful as part of the statement of identity to reflect a change in a food than is the term "modified." In addition, the agency is not persuaded that the term "modified" is an inappropriate term to reflect nutrient changes in a food, or that it should be limited only to uses describing changes in the chemical nature of a food or in the character of the food, such as "modified food starch." Accordingly, the agency is not amending its provision

for the term "modified" and is retaining the criteria as proposed in § 101.13(k).

D. Implied Claims

In the general principles proposal (56 FR 60421 at 60423), FDA proposed to define an implied nutrient content claim as any claim that describes the food or an ingredient therein in such a manner that leads a consumer to assume that a nutrient is absent or present in a certain amount (e.g., "high in oat bran"), or that the food because of its nutrient content, may be useful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy"). The agency stated that, under the provisions of the statute, such implied claims are prohibited until they are defined by FDA by regulation.

However, the agency recognized that an argument could be made that statements such as "contains oat bran" are not intended to be nutrient content claims but are intended to advise consumers about the nature of certain ingredients. Likewise, the agency said that statements that a particular ingredient constitutes 100 percent of the food, e.g., "100 percent corn oil," should not be considered implied nutrient content claims when such statements are the statement of identity for the food. Moreover, the agency reasoned that claims such as "contains no preservatives" could not be characterized as nutrient content claims because they do not relate to nutrients of the type addressed in nutrition labeling.

The agency requested comments on how to draw an appropriate line between implied nutrient content claims and ingredient and other label claims. The agency did not propose regulations that authorized specific implied claims. However, it solicited comments concerning criteria for evaluating whether implied claims are appropriate and not misleading, as well as information on specific implied claims. The agency said that if it received sufficient information in comments, it would consider providing for specific implied claims in the final regulation. The agency said that, alternatively, it would defer action on implied claims until after the rulemaking required by the 1990 amendments is complete and would then consider individual implied claims through the petition process on a case-by-case basis.

1. General

219. The agency received a wide variety of comments on what should constitute an implied nutrient content claim, and on what steps the agency should take to regulate such claims. Some comments stated that FDA must maintain strict control of claims made on food labels in order to prevent misleading nutrient content claims and subsequent consumer confusion. Another comment stated that the agency should develop a list of acceptable implied nutrient content claims and accept others on a petition basis. Several comments asserted that the proposed regulations are too vague and will not allow manufacturers to determine whether or not an ingredient claim will be considered an implied nutrient content claim by the agency. Some of these comments stated that because of the vagueness of provisions that rely on interpreting consumer perception and the criminal nature of violations of the act, it is incumbent on the agency to define with specificity, and through rulemaking, the standards by which implied claims will be judged. Other comments provided a wide variety of suggestions, discussed in detail below, as to what should constitute an implied nutrient content claim, what should not constitute such a claim, and what, if any, implied nutrient content claims should be provided for in regulations.

Other comments suggested that factual statements, particularly ingredient statements, that constitute implied claims and that are found to be misleading should be regulated under the general misbranding provision of section 403(a) of the act. One of these comments asserted that whether a label statement is an implied nutrient content claim can only be determined on a case-by-case basis in which the context of the entire label is considered. The comment stated that it is highly implausible to identify specific words that will always constitute implied claims. Some comments supported such a case-by-case approach on the grounds that a blanket prohibition of ingredient claims that constitute implied nutrient content claims would prohibit the presentation of truthful labeling statements concerning the content of a food product. Another comment stated that affording manufacturers wide latitude in language would better serve to educate consumers about nutrition and the nutrient content of food, because they would not become bored with and disregard a limited number of repetitive descriptors.

The agency disagrees with those comments that said that implied claims should be prohibited and also with those that suggested that all implied claims should be regulated under section 403(a) instead of 403(r) of the act. The language of the statute and the legislative history make clear that implied nutrient content claims are subject to the nutrient content claims regime. Section 403(r)(1)(A) of the act provides that a food is misbranded if it bears a claim that "expressly or by implication characterizes the level" of a nutrient unless the claim is made in accordance with regulations established by FDA. Section 3(b)(1)(A)(i) of the 1990 amendments instructs the agency to establish regulations that identify claims described in section 403(r)(1)(A) of the act that comply with section 403(r)(2). The legislative history (H. Rept. 101–538, supra 19) includes reference to "high in oat bran" as an example of an implied nutrient content claim. This reference to an ingredient claim as an implied claim subject to section 403(r)(1)(A) of the act clearly demonstrates that Congress intended that at least some statements about ingredients be subject to regulation under section 403(r)(1)(A). Accordingly, FDA concludes that it must attempt to define implied nutrient content claims.

The agency examined the comments carefully in attempting to devise a scheme for determining when a label statement is an implied nutrient content claim. The agency agrees with the comment that stated that in many cases whether a label statement is an implied nutrient content claim can only be evaluated on a case-by-case basis, considering the entire label and the context within which the claim is made. However, FDA also agrees with the comments that the definition in proposed § 101.13(b)(2) is too vague. Accordingly, as discussed below, FDA has modified that definition. Moreover, FDA has identified groups of claims that it concludes can be defined and would not be misleading. The agency is providing in new § 101.65(c) definitions for these claims.

However, because of the large variety of statements that can be considered to be implied claims, because of resource constraints, and because of the strict timeframes under which this rulemaking has been accomplished, FDA is unable to adopt a comprehensive set of implied nutrient content claims. Interested persons may provide information to the agency with which it can develop additional definitions, or they may submit petitions requesting approval of specific definitions or brand names.

2. Statements that are not implied claims

The agency has attempted to define as many groups of implied claims as possible so as to permit as many appropriate, nonmisleading implied nutrient content claims as possible in

this final rule. In addition, FDA examined the comments carefully to identify groups of label statements about ingredients and other attributes of foods that are not implied nutrient content claims. The agency finds that it can distinguish several types of statements that can be excluded from the requirements for nutrient content claims. The agency is describing these claims in new § 101.65(b).

a. Statements that facilitate avoidance

220. Several comments stated that some statements of the absence of a substance or an ingredient provide valuable information to consumers who seek to avoid certain substances. The comments noted that statements such as "100 percent milk free" or "contains no milk or milk fat" serve primarily to assist those buyers who adhere to Kosher dietary laws, or those who suffer from lactose intolerance, and wish to avoid dairy products. Other comments noted that statements such as "contains no MSG" or "contains no wheat flour" provide useful, indeed, sometimes vital, information to consumers who are sensitive to these substances. The comment stated that it was not clear from the proposal whether these ingredient statements would be permitted.

The agency has considered these comments and agrees that such statements are not nutrient content claims. Statements of the absence of an allergen are regulated under § 105.62 (21 CFR 105.62), which provides for labeling of foods for special dietary use by reason of the absence of an allergenic property. Statements that declare the absence of other food components or ingredients that are not nutrients of the type required to be declared in nutrition labeling and that are intended to facilitate avoidance of the substance for such reasons as food intolerance, religious beliefs, or dietary practices (such as vegetarianism), e.g., "100 percent milk free," are also not nutrient content claims. FDA has included new § 101.65(b)(1) in its regulations to recognize this fact. However, the agency cautions that such a statement could be made in such a way as to connote a nutrient content claim. For example, a statement such as "contains no milkfat" made in context with other label information about the benefits of reducing fat intake, implies that the product is "fat free." In such a context, the statement would be a nutrient content claim subject to section 403(r)(1)(A) of the act. Also, for example, claims such as "no tropical oils" or "contains no animal fat" are usually made in a context that implies that the product has little or no saturated fat. Therefore, such claims would not be avoidance claims under the provisions of § 101.65(b)(1) but implied "saturated fat free" claims. Thus, they would have to meet the requirements for such claims.

b. Ingredients that do not serve nutritive purposes

221. Several comments stated that factual statements about ingredients, by their very nature, are not nutrient content claims and should be allowed on food labels (e.g., "no artificial colors" and "contains no preservatives"). One comment suggested that this criterion should also apply to nonnutritive or nutritionally insignificant sweeteners such as saccharin, aspartame, and acesulfame-K and to the brand name Nutra-Sweet. Such claims, the comment said, should be accompanied by "not a reduced calorie food" if appropriate, and the label should provide a statement referring specifically to the caloric and sugar declarations in nutrition labeling.

The agency continues to believe, as it stated in the proposal, that claims about the absence of certain substances that do not function as nutrients, such as preservatives and artificial colors, provide information important to certain consumers but are not nutrient content claims because they are not claims about the level of a nutrient. Consequently, such claims are subject to regulation under section 403(a) of the act, to ensure that they are truthful and not misleading, but not section 403(r). Accordingly, the agency is listing in new § 101.65(b)(2) as a second class of claims that are not nutrient content claims, those that are about substances that do not have a nutritive function and do not substitute for nutritive substances, e.g., "contains no preservatives" or "no artificial colors."

However, FDA does not agree with the comment's suggestion that this policy should also apply to label statements referring to the presence of nonnutritive or nutritionally insignificant sweeteners. In the past the agency has regulated statements like "artificially sweetened" and "sweetened with nonnutritive sweetener" as claims of special dietary usefulness (§ 105.66), which in some contexts imply that the food is "low calorie" or "reduced calorie." Elsewhere in this issue of the **Federal Register**, in a companion final rule on revisions to § 105.66 related to the nutrient content claims regulations in this final rule, FDA has discussed its policy on label statements that refer to the presence of a nutritionally insignificant sweetener in a food. In that document the agency reiterated its position that such claims are subject to either new § 105.66(a) and (b), or (e).

c. Ingredients that provide added value

222. A few comments stated that claims about ingredients that provide added value to products convey important information about the quality of the products and should not be considered implied nutrient content claims. The comments suggested that claims such as "made with butter," "contains buttermilk," "made with whole wheat flour," "contains real fruit," or "made with natural, not processed, cheese" would be examples of added value claims.

The agency agrees that some of these claims would be useful as tools for the manufacturer to communicate to the consumer that the product is of high quality because premium or otherwise preferred ingredients have been used. In most instances, statements such as "made with butter," "made with whole fruit," or "contains honey" would not be considered to be a statement about the product's nutrient content. Accordingly, in new § 101.65(b)(3) the agency is listing claims about the presence of an ingredient that is perceived to add value to the product, such as "made with butter," "made with whole fruit," or "contains honey," as statements that are not nutrient content claims. However, there would be cases, such as "made with whole wheat flour," where the added value statement is made in such a context that it could imply not only that a preferred ingredient was used, but also that the product contained a certain level of a nutrient (e.g., fiber). Such statements would be subject to section 403(r) of the act.

d. Statements of identity

223. Some comments agreed with FDA's discussion in the proposal that factual statements that a particular ingredient constitutes 100 percent of the food (e.g., 100 percent corn oil or 100 percent Columbian coffee) are statements of identity and not implied nutrient content claims. In addition, one comment specifically requested that FDA clarify that the names of dietary supplements (e.g., Vitamin C supplements) will not be considered implied nutrient content claims.

The agency concludes that when an ingredient constitutes essentially 100 percent of the food, so that the name of the ingredient is the statement of identity, the name of the ingredient does not constitute an implied nutrient content claim. In such circumstances, the name of the ingredient constitutes

the common or usual name of the product as described in § 101.5 or the identity of the commodity as described in § 101.3. As such it must provide an adequate description of the food.

When the ingredient is not associated with a nutritional benefit (e.g., Colombian coffee), it is clear that the statement of identity does not imply that a nutrient is present or absent in a certain amount. When the ingredient is associated with a particular nutritional benefit (e.g., corn oil), declaring its presence could imply the presence or absence of a nutrient. However, when used as the statement of identity, the name of the ingredient does not imply that the nutrient is present in a certain amount. Rather, it describes the nature of the product and does not specifically characterize the level of the nutrient. Hence, it would not be considered a nutrient content claim. As for the comment that the names of dietary supplements (e.g., vitamin C supplements) are usually not nutrient content claims, FDA intends to deal with this issue in the rulemaking that it will conduct under the Dietary Supplement Act of 1992.

Accordingly, FDA is providing in new § 101.65(b)(4) that the name of an ingredient is not a nutrient content claim when the ingredient constitutes essentially 100 percent of a food, so that the name of the ingredient is the statement of identity of the food. The agency notes, however, that a statement of identity may include an express nutrient content claim (see e.g., the final rule on requirements for foods named by use of a nutrient content claim and a standardized term, published elsewhere in this issue of the **Federal Register**). Such nutrient content claims are fully subject to new § 101.13 and the regulations in part 101, subpart D.

224. Several comments suggested that common names or statements of identity of foods that include terms that relate directly or indirectly to the nutrient content of a food (e.g., "oat bran muffins") should be considered implied nutrient content claims. Other comments suggested that such statements are merely statements of the characterizing ingredient and should not be considered implied nutrient content claims. They suggested that "oat bran muffin" is not different from "carrot spice muffin." One comment stated that truthful statements such as these should be assumed to be nonmisleading unless there is evidence to the contrary and should be permitted as part of the statement of identity.

While FDA agrees that most statements of identity are statements about the character of a food, there are a limited number of statements of identity that contain the name of an ingredient that is associated with a nutrient or a nutritional benefit and that therefore may also be implied nutrient content claims, depending on what other statements are made on the label or in labeling. Examples of such statements of identity would be "corn oil margarine," "oat bran muffins," and "whole grain bread." The agency will evaluate such claims on a case-by-case basis in the context of the entire label and the labeling to determine whether they are nutrient content claims. For example, if the labeling of oat bran muffins includes a discussion of the importance of fiber in the diet, FDA believes that the "oat bran muffins" name is an implied claim that the muffins are high in fiber. If the labeling is devoid of such information, FDA is not likely to consider the name to be an implied nutrient content claim. Accordingly the agency is providing in new § 101.65(b)(5) that a statement of identity that names as a characterizing ingredient, an ingredient associated with a nutrient (e.g., "corn oil margarine," "oat bran muffins," or "whole wheat bagels") is not an implied nutrient content claim unless such claim is made in a context in which label or labeling statements, symbols, vignettes, or other forms of communication suggest that a nutrient is absent or present in a certain amount.

Statements of identity that are provided by a standard of identity subject to section 403(r)(5)(c) of the act are not subject to definition under section 403(r) of the act and are therefore not considered nutrient content claims.

e. Statements of special dietary usefulness

225. One comment requested that the agency clarify that FDA will not deem a statement of special dietary usefulness made on the label or in labeling of a food in accordance with part 105 of FDA's regulations to be an implied nutrient content claim solely because it represents the food to be for special dietary use.

The agency has considered this comment. As stated in the general principles proposal (56 FR 60421 at 60457), FDA views claims on a food relative to special dietary needs to be different from claims made on a food relative to the nutrient content of the food. The agency would not consider claims made solely to portray the usefulness of the food for supplying a particular dietary need that exists by reason of a physical, physiological, pathological, or other condition as described in part 105 to be a nutrient content claims subject to new § 101.13. A claim such as "use as part of a weight reduction program" in and of itself, would not be considered to be a nutrient content claim.

However, there are circumstances in which a claim that a food is useful in a special diet may be made in a context that portrays a nutritional aspect of the food relative to the general population. If, for example, in addition to including a claim that the food was part of a weight reduction program, the label said that the food was "low calorie," or the label contained other statements of specific nutritional information, then such statement would be subject to the requirements for nutrient content claims because the label contained information directed toward the general population. Accordingly, the agency is providing in new § 101.65(b)(6) that label statements made in compliance with part 105 solely to note that a food has special dietary usefulness relative to a physical, physiological, pathological, or other condition where the claim identifies the special diet of which the food is intended to be a part, is generally not a nutrient content claim.

3. Single nutrient implied claims

a. Ingredient statements

226. Many comments addressed how requirements for implied claims should be applied to ingredient statements like "contains oat bran" and "corn oil margarine." Some stated that ingredient statements should not be considered implied nutrient content claims. Other comments stated that even though there are good reasons for having ingredient statements on labels, the fact that a declaration is an ingredient statement does not preclude the possibility that it is also an implied claim. Some said that claims such as "contains no tropical oils" and "made with 100 percent vegetable oil" would be misleading to consumers who would be led to assume that such a product is low in or free from saturated fat, when that is often not the case. A few comments stated that to prevent ingredient claims from being misleading nutrient content claims, all ingredient statements should be subject to the provisions of section 403(r) of the act.

The agency disagrees both with the comments stating that no ingredient claims should be considered to be implied nutrient content claims, and with those that want all ingredient claims to be regulated under section 403(r) of the act. As discussed above, some ingredient statements clearly are not implied nutrient content claims, and

some clearly are, while other ingredient statements will have to be evaluated on a case-by-case basis to determine whether they are implied claims. The agency will evaluate ingredient statements in the context of the total label to determine whether they are implied claims and therefore subject to section 403(r)(1)(A) of the act. The agency's focus will be on whether the ingredient statement identifies a nutrient explicitly or by implication, and whether it states or implies that the nutrient is absent, or that it is present in a certain amount.

227. One comment disagreed with FDA's definition for single nutrient implied claims in proposed § 101.13(b)(2), stating that the phrase "leads a consumer to assume" should be changed to "consumers acting reasonably under the circumstances." This phrase is preferable, the comment said, because it requires that the label be interpreted reasonably, rather than in an arbitrary, unusual, or unreasonable fashion. The comment asserted that a standard that is based on the interpretations of a few credulous people is not legally sustainable. The comment stated that the phrase "consumers acting reasonably under the circumstances" correctly takes into account the context in which the statement is made.

The agency has considered the comment and disagrees that "consumers acting reasonably under the circumstances" is a more valid standard for implied nutrient content claims than the one proposed by the agency. The focus of FDA's definition of implied claims is on what the claim suggests. The definition is not intended to be a quantitative standard to determine the number of consumers who have a particular conception about an individual claim but is intended to focus on what the claim is saying. To clarify the intent of the definition, FDA is striking the phrase in question and replacing it with the word "suggests."

228. A few comments said that FDA should evaluate, on a case-by case basis, whether a manufacturer intends a particular label statement to make an implied nutrient content claim, and whether consumers perceive the statement to be that claim. The comments asserted that a similar approach has been supported by the courts in determining whether a product is sold as a food or a drug.

In making an evaluation of a label statement within the context of the labeling as a whole, FDA agrees that it should consider both the manufacturer's intent and consumer perception. However, it notes that intent means more than the manufacturer's subjective intent. See *National Nutritional Foods Association* v. *Mathews*, 557 F.2d 325, 334 (2d Cir. 1977). An article's intended use is established by its label, labeling, promotional materials, advertising, and "any other relevant source." Id.

FDA advises that it will evaluate ingredient label statements on a case-by-case basis using the definition of implied claims in new § 101.13(b)(2) and the other provisions of the regulations to determine whether a label statement is an implied nutrient content claim. As stated above, the agency's primary focus will be whether the statement identifies the nutrient explicitly or by implication, and whether it states or implies absence of that nutrient or its presence in a certain amount.

229. Several comments suggested that the agency should consult popular media, scientific articles, and consumer surveys to determine when an ingredient claim constitutes an implied nutrient content claim. Several of these comments suggested that implied claims should not be allowed on food labels unless there is scientific consensus as to what these terms mean. On the other hand, a few comments suggested that a statement about an ingredient is not an implied nutrient content claim, unless there is direct consumer survey evidence that a substantial number of consumers understand the statement to imply a specific nutrient claim. The comment contended that any other position would create chaos because manufacturers would continually be in doubt as to whether an ingredient claim would be interpreted by the agency to be an implied nutrient content claim.

Another comment asserted that claims must be interpreted in their historical context. The comment stated that "high in oat bran," implying "high in fiber," for example, is taken out of context. The comment stated that at the time the claim became widely used, consumers believed that they needed to eat oat bran, not soluble fiber, to lower cholesterol. The comment further stated that consumers wanted to know the amount of oat bran in a product in order to follow a diet high in oat bran. However, current scientific evidence may not substantiate this early finding, and the necessity for consuming large amounts of oat bran may not currently be supported by scientific data. Therefore, for an implied claim to be considered valid, the comments said, current scientific data must be considered.

The agency agrees that nutrient content claims should be defined so as to be meaningful to consumers. It has attempted to ensure through the definitions established in these regulations that permitted claims will assist consumers in maintaining healthy dietary practices. In addition, where possible, FDA has used information on consumer understanding of terms. However, the agency is not persuaded that direct consumer survey information is always needed for it to provide clear guidance to manufacturers on whether an ingredient statement is an implied nutrient content claim. As discussed above, FDA is describing in this document some label statements that clearly are nutrient content claims, and others that clearly are not. For those label statements not addressed in this document, manufacturers who wish guidance can submit a petition requesting approval of a claim. The minimum requirements for information needed to support such a request are described in new § 101.69. Petitioners are welcome to provide consumer survey information as well as other types of information in support of a petition.

230. Some comments asserted that FDA's definition of implied nutrient content claims should be limited to those statements that either expressly or by implication describe the level of a nutrient present in a food, as opposed to simply describing the food's composition. One comment stated that such an approach is consistent with Congressional intent as recorded in the House Report, which states:

> An example of an implied claim covered by this section would be the statement "lite", which implies that the product is low in some nutrient (typically calories or fat), but does not say so expressly, or "high oat bran" which conveys an implied high fiber message.

(H. Rept. 101–538, 101st Cong. 2d sess. (June 13, 1990).)

Another comment asserted that it would be inconsistent with the language of the 1990 amendments to regulate claims about an ingredient that do not characterize the level of that ingredient as implied nutrient content claims. The comment requested that FDA specifically exempt ingredient claims that do not directly or indirectly refer to the level of a nutrient (e.g., "contains oat bran" and "made with vegetable oil").

As already discussed, FDA agrees that statements that describe (expressly or by implication) the level of a nutrient present in a food are nutrient content claims. In addition, for ingredients with nutrient implications (e.g., "bran" implies fiber and "tropical oils" implies saturated fat), a claim that describes the

level as "high," "low," or "free" clearly constitutes a nutrient content claim.

The agency does not agree, however, that claims such as "made with oat bran" and "contains vegetable oil" should be exempt from the regulations. It is not clear to FDA that such claims describe the nature of the food and not the level of a nutrient. The agency notes that it is providing in new § 101.54 that a claim that a food is a "good source" of a nutrient can only be made if the nutrient is present at 10 percent or more of the RDI or the DRV per serving of the food. The agency is also providing for use of the terms "contains" and "provides" as synonyms for "good source." As a result, "contains fiber" is a defined expressed claim that must meet the 10 percent of the DRV criterion.

The question then becomes whether "contains oat bran" and "contains whole wheat" imply that the food is a "good source of fiber." Some comments state that such claims are implied nutrient content claims, while others argue that they are statements about an ingredient and not the level of a nutrient. The agency concludes that, in certain contexts, these statements would be nutrient content claims because they call attention to the fact that the product has been made with an ingredient that contains a valuable nutrient. For example, if a label declared "Joe's Oat Bran Muffins" or "Joe's Muffins, made with oat bran" the prominence of "oat bran" may not call attention to it is a way that proclaims its nutritional value. However, if "Joe's Muffins" bore a bright banner with "oat bran" in large, bright letters, the emphasis on "oat bran" would likely place it in the overall context of a nutrient content claim. However, FDA will evaluate these claims on a case-by-case basis, taking into account the entire label and the labeling, including the placement and prominence of the claim as well as the text of label statements.

231. Some comments asserted that FDA should narrow the definition of nutrient content claims to include only those claims specifically mentioning a nutrient of the type addressed in section 403(q) of the act and of the type appearing as part of the nutrition panel (e.g., fat or cholesterol). Similar comments asserted that any statement regarding an ingredient, as opposed to a nutrient, should not be considered an implied claim. One comment asserted that even those ingredient claims that imply that a nutrient is absent or present in a certain amount are not implied claims. Rather, according to these comments they are more appropriately considered statements of identity or parts of ingredient claims. Some comments specifically disagreed with the House report and FDA that the phrase "high in oat bran" should automatically constitute an implied fiber claim. These comments argued that this claim, as well as others that simply describe the ingredients present in a product in a truthful and nonmisleading manner, should be considered ingredient statements. One comment supported this position by stating that these claims do not automatically lead a consumer to assume that fiber is absent or present in any amount. The comment asserted that such a statement simply advises consumers that oat bran is used as a significant ingredient in the product. The comment went on to say that while oat bran does have some relationship to fiber, consumers will not automatically associate the two. A similar comment requested that FDA alter proposed § 101.13(b)(2) to read, "e.g., high in oat bran, which may imply that a food is also high in fiber."

The agency does not agree that nutrient content claims under section 403(r)(1)(A) of the act are limited to label statements that specifically identify a nutrient, e.g., fat or cholesterol. The legislative history identifies the term "high in oat bran" as an example of an implied nutrient content claim (H. Rept 101–538, 101st Cong. 2d sess. 19 (June 13, 1990)). This statement provides strong evidence that when Congress said that "a claim * * * which expressly or by implication—characterizes the level of a nutrient * * * must be made in accordance with section 403(r)(2)," it intended to include ingredient claims that imply that a nutrient is present at a particular level in, or is absent from, the food. Accordingly, FDA rejects the comment that objected to this interpretation.

The agency advises that there are long established relationships between ingredients and nutrients that are covered under the definition of implied nutrient content claims. Some of these ingredient-nutrient relationships have been regulated as claims for special dietary use. For example, terms like "sugar free" have been regulated by FDA as implying that the product is low or significantly reduced in calories (§ 105.66). In addition, FDA has issued warning letters regarding foods that contain tropical oils (which contain significant levels of saturated fat) when they bear label statements, like "100 percent vegetable oil," that imply that these ingredients have low levels of saturated fat.

Consequently, FDA is not granting the request to exempt from the nutrient content claim requirements ingredient claims that do not explicitly identify a nutrient. However, as discussed in the previous comment, the agency acknowledges that some statements that name ingredients that have nutritional relevance are not nutrient content claims. The agency will evaluate such claims on a case-by-case basis. In addition, where appropriate, manufacturers may submit petitions under new § 101.69 requesting approval of specific claims.

232. A few comments suggested that only those ingredient statements that meet the definition for a defined nutrient content claim should be considered implied nutrient content claims, and that all other ingredient claims should not be considered nutrient content claims. However, several other comments suggested that all ingredient claims that imply that a nutrient is either absent or present at a particular level, whether or not they met the definition of the expressed term, should be considered implied nutrient content claims.

Some of the latter comments said that only those implied claims that meet the requirement for an analogous expressed claim should be permitted on the label or in labeling. For example, several comments said that a statement that a product "contains oat bran" implies that the product is a good source of fiber and should, therefore, only be permitted on foods that meet the definition for "good source of fiber." The comments said that requiring that the expressed claim be met in order to make an implied claim would be effective in preventing manufacturers from using claims on food that may not meet appropriate nutritional standards. Another group of comments stated that any "no [ingredient]" claims (e.g., "contains no tropical oils") that imply that the product is free of a nutrient, but that disparage the absent ingredient, could be misleading if there is inadequate scientific support for health concerns about the ingredient and therefore should be prohibited. The comments presented various other examples to either support or oppose a requirement that an implied ingredient claim that meets the requirements for an explicit nutrient content claim should be permitted.

The agency agrees that ingredient claims that make implied representations about the level of a nutrient in a food, whether or not they meet the definition of the expressed claim, should be considered implied nutrient content claims. This conclusion is consistent with section 403(r)(1)(A) of the act, which states that a food can be misbranded by a statement that

expressly or by implication characterizes the level of a nutrient in a food. An ingredient claim that implies that a nutrient is present in the food at a particular level, but that fails to meet the requirements for the equivalent express claim, will misbrand the food under section 403(r)(1)(A) of the act.

The question of whether claims like "contains no tropical oil" should be prohibited as misleading because they disparage the ingredient will turn on what the scientific evidence shows about the ingredient. If it is commonly known that the ingredient for which absence is claimed is a source of a nutrient for which the current dietary guidelines recommend decreased or moderated intake, then there is no reason for the agency to refuse to permit the claim. The fact that FDA would permit such a claim, however, would in no way represent a disparagement of the ingredient. The claim provides a means by which a manufacturer could highlight the saturated fat content of its food. It does not imply that the ingredient in question is a "bad" food.

233. One comment suggested that FDA allow companies to use expressed or implied nutrient content claims (in brand names or otherwise) that have not been defined or specifically approved by the agency if the claim is not false and misleading and is consistent with, and explained by, an immediately adjacent term that is defined in the agency's regulations. Alternatively, the comment requested that FDA permit ingredient claims that did not meet the expressed nutrient content claims definition but require them to be followed by a factual statement clarifying the nutrient content implication (e.g., "no tropical oils—this product contains 2 g of saturated fat" or "contains oat bran—not a significant source of fiber"). The comment stated that, in effect, companies would be allowed to define certain ingredient claims as implied nutrient content claims. Such a process would be in addition to the petition process established by FDA, thus allowing a company to choose whether to determine its own definition of an expressed or implied nutrient content claim or to petition the agency for a codified definition. The inclusion of a self-definition procedure would, the comment contended, be more in keeping with Executive Order 12630. Also, according to the comment, under such a policy, companies would not be forced to abandon nonmisleading implied claims and brand names, as they would under FDA's proposed rule. Companies would also not be made to change labels repeatedly, or ce by the effective date of the regulations and again after each new implied nutrient content claim is approved. Finally, the comment stated that the rule proposed by FDA would lead to a proliferation of unexplained terms that have been defined by FDA in the regulations but which have little or no meaning to consumers, whereas the procedure suggested in the comment would require the use of a defined term on the label to explain the intended meaning of the implied claim, adding significantly to consumer understanding. The comment asserted that the alternative method is fully consistent with the language and the intent of the 1990 amendments.

The agency does not agree that allowing manufacturers to use undefined claims that do not meet the definition for an expressed claim to be accompanied by a defining statement is consistent with either the intent or the letter of the 1990 amendments. The act provides that claims that characterize the level of a nutrient either expressly or by implication "may be made only if the characterization of the level made in the claim uses terms which are defined in regulations of the Secretary" (section 403(r)(2)(A)(i) of the act). Thus, Executive Order 12630 is not relevant to the approach that FDA is required by statute to take on this matter. To do as the comment requests and allow manufacturers to continue using any label statements they choose (provided they add a defining statement as explanation) would be inconsistent with the letter and spirit of the act. The agency points out that under section 403(r)(4)(A) of the act, any person may petition the agency for permission to use terms that are subject to section 403(r)(2)(A)(i). This section also provides timeframes in which the agency must act on these petitions. Thus, there should not be any undue delay in obtaining a determination as to whether the claims can be used. Because the act specifically provides a mechanism by which use of claims can be authorized, the agency concludes that it would be inappropriate for FDA to establish an alternate mechanism by which such claims can be used.

The agency disagrees that companies would be required to make frequent label changes because of the approval of each new term. The company could decide what term it wants to use, determine whether the use of the term has been authorized, and if it has not been, petition for such authorization. Once the use of a term is authorized, the firm would be free to use it. Any change in the company's labeling made after that point because FDA approved a new term would occur because the company wanted to take advantage of the term, not because FDA compelled a change.

The agency also disagrees that there would be a proliferation of unexplained terms defined by FDA that would have little meaning to consumers. The agency is establishing only a distinct group of terms and synonyms with well defined meanings that may be used as nutrient content claims. Any additional terms that are included in response to a request of a petitioner will have been shown to be as well supported as those terms originally defined.

The agency concludes that the approach to regulating implied nutrient content claims suggested by the comment is not consistent with the structure established by 1990 amendments and will not promote better consumer understanding of label claims. Accordingly, FDA is not permitting use of undefined nutrient content claims accompanied by an explanation.

234. Many comments asserted that factual declarations of the amount of an ingredient (e.g., "160 mg of sodium," or "contains less than 300 calories") do not constitute implied nutrient content claims. Other comments maintained that statements concerning the percent of a nutrient (e.g., "9 percent fat") should also not be considered implied nutrient content claim.

The agency advises that declarations of the amount of a nutrient or the percent of a nutrient are provided for in new § 101.13(i). That provision, pursuant to section 3(b)(1)(A)(iv) of the 1990 amendments, states that such statements must meet the definition for a defined term or must be accompanied by a statement that the food does not meet the appropriate definition. Comments 16 through 19 of this document contain a full discussion of such claims.

235. One comment suggested that "equivalent" be defined as a nutrient content claim so that comparisons could be made to indicate that a food had the amount of a nutrient equivalent to a reference food, e.g., "contains as much fiber as an apple." The comment stated that this type of claim was particularly appropriate for dietary supplements.

The agency advises that it considers the example given in the comment to be an implied claim about the fiber content of the food. "Contains as much dietary fiber as an apple" implies that one apple is a good source of fiber, and that by being equivalent in fiber to an apple, the labeled food is also a good source of fiber. Such a claim can be used to provide valid, valuable information to the consumer about the nature of a

product in terms of another product that the consumer already understands. However, the agency believes that such a statement would be misleading if the labeled food was compared to the level of nutrient in a food that was not consistent with dietary guidelines, namely the amount of nutrient in a food which is "free," "low," a "good source," or "high." Likewise such a claim would be misleading if comparisons between the foods were not made on a common basis. Because a serving of the product is the amount customarily consumed in one eating occasion (a value which is applicable to all foods), the agency concludes that comparisons using this type of claim should be made on a per serving basis.

Accordingly, the agency is providing in new § 101.65(c)(2) for the use of equivalence claims using the phrases "contains the same amount of [nutrient] as a [food]" and "as much [nutrient] as a [food]" to imply that the reference food is a good source of specified nutrient, and that on a per serving basis, the labeled food is an equivalent, good source of that nutrient (e.g., "as much fiber as an apple," "contains the same amount of Vitamin C as a glass of orange juice").

236. Several comments requested that the agency define specific implied claims so that their use would be permitted in labeling. Claims that were suggested included "high in oat bran," "contains no oil," "no tropical oils," and "contains canola oil." While the comments suggested definitions for the claims, they were not always in agreement on what the definitions should be.

The agency has carefully considered these terms and is providing its interpretation of the nutrient content implied by the label statement. Label statements about oils like corn, sunflower, safflower, and canola generally refer to the oils' fatty acid content. Accordingly, FDA considers a statement about a type of oil as an ingredient, such as "made with canola oil" or "contains corn oil," to generally imply that the oil in the product was low in saturated fatty acids. The statement "made only with vegetable oil" implies that because vegetable oil was used instead of animal fat, the oil component was low in saturated fat.

A claim that a product contains "no tropical oils," including a statement about the absence of a specific tropical oil, assumes that the consumer understands that tropical oils have a large amount of saturated fats. Such a claim would imply that another oil had been used that did not have a large amount of saturated fat. Consequently, a claim that a product "contains no tropical oils" would imply that the product is "low in saturated fat."

The agency considers that a statement that a product "contains no oil" implies that the product is not made with lipids (fat). Accordingly, such a claim would imply that the product was "fat free." Such a claim on a product that contained another source of lipids (e.g., animal fat) would be misleading.

Further, the agency considers that a claim that a product is made with or otherwise contains a whole grain, a bran, or any type of dietary fiber (such as soluble fiber), implies that the product is a good source of total dietary fiber. Such a claim would therefore be misleading if the product did not contain sufficient fiber derived largely from the sources of fiber mentioned such that the product met the definition for "good source of dietary fiber." However, a claim naming these ingredients that also used the term "high" or a synonym thereof would be misleading if the product was not "high in dietary fiber."

The agency would generally not consider ingredient claims that are consistent with the meanings that it has outlined above to be misleading under section 403(a) of the act. However, as with any implied claim, the agency will consider the appropriateness of the use of the claim in the context in which it is made.

The agency advises that it does not consider that the terms that it has mentioned provide an all-inclusive list of those ingredients that imply the level of a nutrient. Claims for other nutrients will be considered on a case-by-case basis.

In conclusion, a claim that states or implies a characteristic that distinguishes a particular nutritional attribute of an ingredient will generally be considered an implied nutrient content claim. Whether or not it is a nutrient content claim will depend on the context in which it is presented, taking the entire label into consideration. The level of the ingredient may be implicit or explicit. The agency has described generically in new § 101.65(c)(3) circumstances under which such implied claims can be made. The regulation states that claims may be made that a food contains or is made with an ingredient that is known to contain a particular nutrient, or is prepared in a way that affects the content of a particular nutrient in the food, if the finished food is either low in or a good source of the nutrient that is associated with the ingredient or type of preparation. If a more specific level is claimed (e.g., "high in ————"), that level of the nutrient must be present in the food. For example, a claim that a food contains oat bran is a claim that it is a good source of fiber; that a food is made only with vegetable oil is a claim that it is low in saturated fat; and that a food contains no oil is a claim that it is fat free.

The agency believes that the approach that it is taking in § 101.65(c)(3) strikes an appropriate balance between the interest of industry in making claims and the consumers' interest that claims that appear on the label accurately and fairly characterize the level in the food of the nutrient that, either explicitly or implicitly, is the subject of the claim.

b. Accompanying information

237. One comment suggested that implied nutrient content claims should be accompanied by appropriate referral statements that are consistent with the requirement for such statements to accompany nutrient content claims.

The agency advises that implied nutrient content claims that are defined in new § 101.65 (a)(2), must comply with all of the requirements for nutrient content claims described in new § 101.13. Among the requirements is the requirement for referral statements. In addition, FDA advises that as with other nutrient content claims, labels bearing such implied claims must also bear nutrition labeling in accordance with the requirements of new § 101.9 or, where applicable, new § 101.10. For clarity, the agency is listing the latter requirement in new § 101.65(a)(3).

4. General nutrition claims

In the general principles proposal (56 FR 60421 at 60423) FDA proposed to include in § 101.13(b)(2) a provision that label statements that imply that a product would be useful to consumers in selecting foods that are helpful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy") are implied nutrient content claims.

a. General comments

238. Many comments asserted that FDA's definition of implied nutrient content claims should not include claims that imply that a "food because of its nutrient content may be useful in achieving a total diet that conforms to current dietary recommendations (e.g., healthy)."Some of these comments stated that Congress showed no interest in regulating such claims but instead was concerned only with regulating those statements that characterize the level of a nutrient present in a food. One such comment noted that neither the act nor the legislative history contains any

language addressing general nutrition claims.

The agency does not agree with these comments. First, the reading of section 403(r)(1)(A) of the act suggested by these comments is clearly too narrow. A claim that a food, because of its nutrient content, may by useful in maintaining healthy dietary practices is clearly a claim that characterizes the level of nutrient in that food. The claim is essentially saying that the level of nutrients in the food is such that the food will contribute to good health.

Moreover, Congress was clearly concerned with such claims. The October 24, 1990, proceedings in the Senate show that one purpose of the 1990 amendments was to regulate the use of nutrient content claims that appear on food labels and labeling in order to help consumers make appropriate dietary choices (136 Congressional Record S16610 (October 24, 1990)). In addition, section 403(r) of the act itself, repeatedly uses the phrase "* * * will assist consumers in maintaining healthy dietary practices" to describe the information for which provision is being made (see e.g., section 403(r)(2)(A)(ii)(II) and (r)(2)(A)(iii)(I) of the act).

The agency is therefore not persuaded that this aspect of the proposed definition of implied nutrient content claims is inconsistent with the language of the act, the intent of Congress, or the goals of the 1990 amendments. However, FDA is modifying § 101.12(b)(2)(ii) to replace the phrase "* * * achieving a total diet that conforms to current dietary recommendations" with the statutory phrase "* * * maintaining healthy dietary practices."

239. Some comments objected to regulating terms such as "nutritious," "healthy," and "wholesome" under section 403(r) of the act because they have different meanings depending on their contextual use and would be difficult to define. These comments asserted that the agency should instead regulate the use of such terms on a case-by-case basis under section 403(a) of the act. The comments asked for assurance that these terms would not be regulated under section 403(r) of the act.

Other comments asserted that terms such as "wholesome," "nutritious," "eating right," "basic 4," "smart," and "good for you" are implied nutrient content claims and should be banned from food labels. A few of these comments suggested that such terms are more appropriately used to describe an overall diet and should not be used on the labels of individual foods. One of these comments cited a poll that was conducted for them in February 1992, in which 1,007 individuals were interviewed concerning their interpretations of the terms "wholesome" and "nutritious." The comment reported that, other than the 55 percent who responded that the term "wholesome" on a food label meant that the product was "good for you," none of the possible responses for the meaning of either term garnered more than 23 percent of the respondents. Some comments, however, suggested that terms such as "wholesome," "nutritious," "eating right," "basic 4," "smart," and "good for you" could be defined as synonyms for "healthy." Some of these comments supported such a definition only as a secondary option to banning the terms, while other comments stated that the terms should be allowed but controlled. One comment stated that if terms such as "healthy" are held to be implied nutrient content claims, then other suggestive words having to do with a product's quality, such as "beneficial" and "hearty," must similarly be defined or banned.

Some comments expressed concern about continued use of such terms in brand names grandfathered under section 403(r)(2)(C) of the act. One of these comments stated that leaving the terms undefined allows companies that used the claims before October 25, 1989, to continue to use them on foods that may not meet appropriate standards. The comment stated that if FDA chooses to define such terms, then the definition must include strict and comprehensive criteria.

One comment stated that the proposed definition for general nutrition claims could have an impact on many proprietary trademarks or slogans such as "Keeping Fit!", "Stay 'n Shape," "Product 19," "Breakfast of Champions," "Eat Right and Look It," and "Right Choice." Although the comment maintained that Congress did not intend these terms to be regulated, it acknowledged that these brand names serve as a beacon to consumers to indicate that there is something nutritionally desirable about the product.

FDA disagrees that terms such as those cited in the comments should be automatically excluded from regulation under section 403(r) of the act. The agency believes that these terms can be implied nutrient content claims when they appear in a nutritional context on a label or in labeling. FDA advises that it will consider these terms to be in a nutritional context when they appear in association with an explicit or implicit claim or statement about a nutrient. For example, in the statement "nutritious, contains 3 g of fiber," "nutritious" is an implied nutrient content claim because it suggests that the food may be useful in maintaining healthy dietary practices. Accordingly, the agency is providing in new § 101.65(d)(1) that such statements are implied nutrient content claims and are subject to the requirements of section 403(r) of the act.

However, the agency also believes that when a term such as "healthy," "wholesome," and "nutritious" appears on a food label in a context that does not render it an implied nutrient content claim, it is not subject to the requirements of section 403(r) of the act. Under such conditions, the use of the term is subject to section 403(a) of the act, and FDA will determine whether it is misleading on a case-by-case basis.

The agency further advises that, except for "healthy," it does not have enough information to decide if definitions for the terms mentioned in these comments are needed, and if so, what those definitions should be. In a tentative final rule published elsewhere in this issue of the **Federal Register**, the agency is providing its tentative position on an appropriate definition for "healthy" based on information received in the comments. In addition, because of the time constraints of this rulemaking, FDA has been unable to develop information with which to make such a decision. The agency solicits information on whether such definitions are appropriate, and if definitions are appropriate, what they should be. Interested persons may submit appropriate petitions under new § 101.69 with accompanying substantiating information to initiate this process.

E. Use of Nutrient Content Claims with Meal-type Products

1. Definition of meal-type products

In the general principles proposal (56 FR 60421 at 60455), FDA proposed a definition for a "meal-type product" for the purpose of regulating nutrient content claims for these products on a different basis than for individual foods. The proposal cited the many comments that the agency received in response to the ANPRM (54 FR 32610), and during the public hearings that followed, that requested that FDA define and allow for the use of nutrient content claims for meal-type products. FDA proposed in § 101.13(l), to define a "meal-type product" as a food that: (1) Makes a significant contribution to the diet either by providing at least 200 calories per serving (container) or by weighing at least 6 ounces per serving (container);

(2) contains ingredients from 2 or more of 4 food groups; and (3) is represented, or is in a form commonly understood to be, a breakfast, lunch, dinner, meal, main dish, entree, or pizza. The four food groups in § 101.13(l) were: (1) Bread, cereal, rice and pasta group; (2) fruits and vegetables group, (3) milk, yogurt, and cheese group; and (4) meat, poultry, fish, dry beans, eggs, and nuts group. The agency recognized that current guidelines for daily food intake specify five food groups, distinguishing between fruits and vegetables. However, FDA proposed to combine the fruits and vegetables groups for regulatory purposes.

FDA requested comments on the appropriateness of this definition of a "meal-type product" as well as on the appropriateness of specific amounts (e.g., 200 calories and 6 ounces) and specific product types (e.g., "main dish") used as a basis for this definition.

The agency received many comments on the need for separate criteria for meal-type products and the definition of meal-type products. After reviewing these comments, the agency continues to believe that separate criteria for meal-type products are needed but is revising the definition of a "meal-type product" to establish separate definitions for meal products and main dish products for the purpose of regulating claims (these products will still be referred to collectively as "meal-type products" in this preamble).

246. The majority of comments supported separate criteria for meal-type products as compared to individual foods. Two comments, however, stated that FDA should not create separate nutrient content claim definitions for these foods because meal-type products contain no more food or calories than ordinary foods. One of these comments also stated that FDA's proposal arbitrarily sets up a double standard for nutrient content claims in the marketplace. Alternatively, these comments recommended that the criteria for claims such as "low," "source," and "high" on all food products be based on specified nutrient levels per serving and per reference amount, or specified nutrient levels per 100 calories (or per 100 nonfat calories in the case of sodium and cholesterol). For example, for "low fat," one comment suggested that the criteria be no more than 3 g of fat per serving and per reference amount, or no more than 20 percent of calories from fat. For "low cholesterol," the comment suggested that the criteria be no more than 20 mg of cholesterol per serving and per reference amount, or no more than 15 mg per 100 nonfat calories. The comments stated that the alternative criteria would allow foods that are high in calories to make "low" claims for certain nutrients.

The agency acknowledges the complexity in defining a meal-type product for the purpose of regulating claims and agrees that, with any such definition, there is the potential for certain requirements that may result in similar food products having different bases for claims. The agency carefully considered the suggestion that it establish a single set of criteria for all types of food products but concluded that it was not appropriate to do so. This approach would generally result in the application of the per 100 calorie criterion rather than the per serving and per reference amount criterion to meal-type products, because the former would permit products to contain greater amounts of nutrients per serving. For example, a 400 calorie product could have as much as 9 g of fat if "low fat" was defined as not more than 20 percent of calories from fat. However, the agency concludes that the primary criterion for all "low" definitions for nutrients should be based on nutrient levels per 100 g as proposed, rather than on specified nutrient levels per 100 calories (or per 100 nonfat calories). The agency concludes that it is inappropriate to have as a primary basis for "low" claim a criterion that considers total fat levels in a food in addition to the levels of another nutrient that is the subject of the claim. For example, given the suggested criterion of no more than 15 mg of cholesterol per 100 nonfat calories, a 400 calorie dinner with 40 percent of the calories contributed by total fat could have only 36 mg of cholesterol, whereas another dinner with the same number of calories but only 20 percent of the calories contributed by total fat could have as much as 48 mg of cholesterol. The agency further believes that it would confuse consumers to have a criterion that links the amount of total fat in a product to the product's ability to make a "low" claim about another nutrient such as cholesterol or sodium. Accordingly, the agency is not persuaded to adopt this alternative set of criteria for meal-type products and individual foods.

However as discussed in comment 52 of this document, the agency has concluded that it is appropriate to have for "low" claims for fat and saturated fat, a second criterion that considers their caloric contribution to a meal-type product.

247. Some industry comments supported the proposed definition of a meal-type product, whereas others stated that the definition was too broad with respect to the minimum requirement of either 200 calories or 6 ounces and with respect to the inclusion of main dishes, entrees, and pizzas in this category.

One comment said that the 200 calorie level is an insufficient amount of food for a "meal-type product," even as part of a reducing diet, and that those who purchase such food could easily be misled that such foods will provide them with a filling, balanced meal. Other comments maintained that 200 calorie food items are meal segments, not meal replacers, for the vast majority of consumers and should not be included in a definition for a "meal-type product." Some comments recommended that a minimum of 500 calories be used. These comments maintained that a 500 calorie minimum would be a more accurate reflection of the calorie content of an individual's meal. They stated that foods that contain this higher calorie level still comprise less than one-third of the calories consumed by the segment of the population that consumes the fewest calories, and that this level would comprise about one-fourth of the typical consumer's daily caloric intake. One comment suggested that 350 calories be the minimum level, while another comment suggested that 300 calories be the minimum requirement.

These comments acknowledged, however, that a minimum calorie requirement, whether at 200 calories or 500 calories, could result in similar products slightly below or above these levels having very different outcomes with respect to claims. For example, it was stated that with FDA's proposal, a 200 calorie serving of soup could qualify for a "low fat" claim with 6 g of fat, whereas a 190 calorie soup that contained only 4 to 5 g of fat could not.

The agency acknowledges that the 200 calorie level is about equal to or less than one-tenth of the National Research Council's recommended energy allowances for adults (Ref. 28). The agency further agrees with the comments that a number of individual foods would meet this minimum caloric level. In addition, the agency has noted that, with this proposed minimum caloric level, it would be possible for meal-type products below the 300 calorie range that met the 3 g per 100-g criterion for "low fat" to contain more than 30 percent of calories from fat. This result would not occur if the agency adopted a higher minimum caloric level, such as 500 calories. However, this higher minimum caloric level would exclude a number of meal products that for some consumers are

appropriate for weight maintenance and for other consumers are appropriate for intended weight reduction.

The agency also considered whether to adopt the suggested levels of 350 or 500 calories. However, as pointed out in the comments, using a 350 or 500 calorie minimum requirement would not eliminate the problem of similar products having different outcomes for claims.

For these reasons, the agency is persuaded that a minimum calorie requirement is not an appropriate basis on which to define meal-type products, and that another product type category that would make the meal-type product category less broad is necessary. Accordingly, the agency has dropped a minimum calorie requirement from the definition of a "meal product" in § 101.13(l) and is not including one in the definition of a "main dish product" in § 101.13(m) (discussed below).

248. A few comments addressed the proposed requirement in the definition of a meal-type product that the food be represented as, or in a form commonly understood to be, a breakfast, lunch, dinner, meal, main dish, entree, or pizza. These comments stated that there needed to be a clear distinction in the regulations of the types of foods that are eligible to bear claims as "meal products." One comment raised the question of whether foods such as a danish, fruit sweetened yogurt, or a bowl of cereal could be a breakfast entree, or whether pasta, beans in tomato sauce, soup, or a baked potato with topping could be a lunch or dinner entree. Another comment suggested that entrees including pizza have a different basis for claims than meal products, and that this basis should be the reference amounts for mixed dishes.

These comments further demonstrate that the proposed category of a meal-type product is too broad for the purpose of regulating claims, and that an additional category needs to be established. The types of products that the agency intended to include in meal-type products, besides meal products, included foods that are often represented as main dish products and, thus, represent only a portion of the complete meal. Based on the comments, however, the agency is persuaded that it would be inappropriate to apply the same criteria to a product that represents a meal and to a product that represents a significant portion of a meal. Thus, the agency is persuaded that separate criteria for claims should be established for meal products and for main dish products. Accordingly, FDA is revising proposed § 101.13(l) to define a "meal product" and is defining a "main dish product" in § 101.13(m). The requirements in these definitions are discussed in comments 249, 251, and 252 of this document.

249. Some comments agreed with the 6-ounce minimum requirement, while other comments stated that this minimum requirement was too low. One of the latter comments stated that this minimum would be met by such products as canned soups, pastas, beverages, and most containers of yogurt, and that even the skimpiest meals or entrees weigh closer to 10 ounces. Another comment suggested that the minimum weight requirement should be at least 7 ounces per serving.

The agency acknowledges that the minimum 6-ounce weight is low for many meal products, even though it is within the range of main dish products that are now marketed. USDA has required that frozen products labeled as "dinner" or "supper" weigh at least 10 ounces (Ref. 29). Thus, FDA concludes that it is appropriate to require that products represented as meals weigh, at a minimum, 10 ounces to be consistent with USDA. Further, FDA believes that products weighing between 6 and 10 ounces which were defined as meal-type products in the proposal, generally are marketed as entrees and side dishes. Thus, the agency finds that because of their contribution to the overall diet and because of consumer expectations, it is appropriate to require that main dishes weigh at least 6 ounces.

Accordingly, for the purpose of making a claim, FDA is defining a "meal product" in § 101.13(l)(1) as a food that makes a major contribution to the total diet by weighing at least 10 ounces per labeled serving. Likewise, for the purpose of making a claim, FDA is defining a "main dish" in § 101.13(m)(1) as a food that makes a major contribution to a complete meal by weighing at least 6 ounces per labeled serving.

Consistent with these provisions, the agency is also revising proposed § 101.13(l)(3) (redesignated as new § 101.13(l)(2)) to provide that to qualify as a "meal product" the food be represented as or be in a form commonly understood to be, a breakfast, lunch, dinner, or meal. The agency is retaining the provision that such representations may be made either by statements, photographs, or vignettes. The agency is aware that some products currently available in the marketplace are represented as meals but weigh somewhat less that 10 ounces. Should these products make nutrient content claims, the agency advises that such claims should comply with the provisions established for main dish products in § 101.13(m)(2). This will ensure the application of appropriate disclosure levels for such products (see comment 273 of this document).

The agency is requiring in new § 101.13(m)(2) that to qualify as a "main dish" the food be represented as, or be in a form commonly understood to be, a main dish (e.g., not a beverage or a dessert). The agency has cited beverages and desserts in this provision because they are not commonly understood to be a main dish and thus are appropriately excluded. However, foods that may be marketed as main dishes in the future are not categorically excluded from being main dishes but will be considered by the agency on a case-by-case basis. 250. A few comments objected to use of the term "container" in the agency's proposed requirement that a meal-type product weigh at least 6 ounces per serving (container). The comments maintained that the term "container" effectively equates meal-type products with single-serving containers, whereas meal-type products are packaged in both single-serve and multiple-serve containers. One comment stated that it makes no sense to have a provision that would allow a product in a single-serve container to make a claim but not an identical product packaged differently.

The agency agrees with the comments that the term "container" may inappropriately equate meal-type products with single-serving containers. This was not the intent of the proposal. Therefore, the agency is deleting the term "container" from new § 101.13(l)(1)(i) and (m)(1)(i).

251. Some comments suggested revisions to FDA's proposed requirement that a meal-type product contain ingredients from two or more of four food groups. Several comments supported a requirement that the product contain at least 3 different foods. A few comments suggested that a specified number of food servings be required rather than ingredients, because, according to one comment, the requirement for two "ingredients," irrespective of their amount, was meaningless. Another comment suggested that a serving be at least one-half the reference amount.

Given the decision to provide separate criteria for meals and main dishes, the agency is persuaded that a meal product should contain at least three different foods from at least two of four food groups and is revising new § 101.13(l)(1)(ii) accordingly. Dietary guidance recommends that Americans assemble daily diets by selecting a variety of foods from the various food groups. Because meals are large

segments of the diet, it is appropriate to expect that meals would include at least three different foods from at least two food groups. Main dishes, on the other hand, are combined with other foods to create a meal and thus may contain as few as two foods from two food groups. Therefore, the agency is requiring in § 101.13(m)(1)(ii) that a main dish product contain at least two different foods from two of four food groups.

The agency also agrees that the requirement for a specified number of foods may be problematic without a minimum weight requirement. FDA considered whether there should be a requirement based on a minimum percentage of a reference amount such as 50 percent. The agency has concluded, however, that such a requirement would be difficult to implement and may not in the end be meaningful. Different reference amounts could be applied to a food in a meal-type product depending on how the food was prepared (e.g., with or without sauce), how it was used in a product (e.g., as a major component or a garnish), or whether the food is subject to a mixed dish reference amount.

Therefore, the agency has developed an alternative approach that derives from the comment that suggested that a serving be at least one-half of the reference amount, the aim of which would be to prevent an ingredient that is present in small amounts from counting toward the requirement that a meal product and a main dish product contain a minimum number of foods from at least two food groups. Thus, FDA has revised new § 101.13(l)(1)(ii) and (m)(1)(ii) to require that a meal product contain not less than 40 g each of the minimum number of different foods.

The 40 g minimum requirement is about one-half of the reference amount for fish, shellfish, or meat/poultry substitutes without sauce (reference amount is 85 g) and is about one-half of the reference amount for drained vegetables (reference amount is 85 g). The 40 g amount is also within the middle range when comparing one-half the reference amount of foods with large reference amounts (e.g., 140 g is the reference amount for pasta) to products with small reference amounts (e.g., 30 g is the reference amount for cheese); that is, 40 g is about midway between 15 g and 70 g. The 40 g amount should not be confused with the reference amounts for individual foods.

252. One comment stated that FDA's proposed requirement that a meal-type product contain ingredients from at least two food groups sets up an artificial distinction between foods. The comment asked, for example, would breaded fish, but not unbreaded fish, be considered as consisting of two food groups?

The agency finds that it is inappropriate to include certain types of foods when determining the number of foods from the four food groups because such foods cannot be considered to contribute a recommended serving of food. These type of foods are gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings, and garnishes. The agency also believes that it is inappropriate to count sauces toward this requirement because of their high water content. However, a food that is in a sauce and that belongs to one of the four food groups can be counted toward the requirement for the particular food group if the food weighs a minimum of 40 g (e.g., 40 g of tomatoes in tomato sauce). The agency believes that a requirement for a minimum amount of a food in a meal or main dish product should be determined by the weight of the food and not by the way in which the food is presented in the product (i.e., an ingredient in a sauce).

Accordingly, the agency is providing for a meal product in § 101.13(l)(1)(ii)(E) and main dish product in § 101.13(m)(1)(ii)(E) that gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings, and garnishes can not be counted as foods to meet the requirement for a specified number of foods from at least two food groups. This provision also excludes sauces except for foods in the four food groups that are in the sauces.

253. One comment suggested that there be separate food groups for fruits and for vegetables. It pointed out that such a separation would be consistent with the food groups recommended in current dietary guidelines.

FDA endorses the five food groups recommended in current dietary guidelines. For this particular regulatory application, however, the agency believes fruits and vegetables should not be treated as separate groups. While the agency acknowledges the important and distinct contributions each makes to the diet, FDA is concerned that a combination of a fruit and a vegetable could be classified as a main dish. The nutritional contribution of each, while not the same, is more similar than any other two food groups. These products would contribute only a limited number of calories and would fail to contribute as diverse a range of nutrients and food components as a combination of two other food groups.

2. Definition of "free" for meal-type products

In the general principles proposal (56 FR 60421 at 60473), FDA proposed definitions of the term "free" to describe the content of sugar and sodium in a food. The agency also proposed in the fat/cholesterol proposal (56 FR 60478) definitions of the term "free" to describe the content of fat and cholesterol in a food. These proposed definitions applied both to individual foods and to meal-type products, and for meal-type products, were based on specified nutrient levels per reference amount and per labeled serving. The rationale proposed for the definition of "free" was based on the finding that this nutrient content claim is an absolute term implying absence of a nutrient. The agency further stated that the definition considered the level of a nutrient that is at the reliable limit of detection and that is dietetically trivial or physiologically inconsequential.

254. One comment supported the use of the same criteria for "free" claims for individual foods and for meal-type products. Another comment suggested that all nutrient content claims for meal-type products should be based on nutrient levels per 100 g of food.

The agency continues to believe, as it stated in the general principles proposal (56 FR 60421 at 60433), that the term "free" is an absolute term implying absence of a nutrient in a serving of a food, whether it is an individual food or a meal-type product, not absence of a nutrient in a specified weight of food such as per 100 g. Therefore, the agency rejects the suggestion that it base "free" claims for meal-type products on nutrient levels per 100 g.

255. One comment stated that the proposed requirement of less than 2 mg per serving in the definition of "cholesterol free" for meal-type products is unreasonable. This comment stated that 2 mg of cholesterol in a 9-ounce serving is less than 0.008 percent, whereas in a small serving product such as crackers, the same amount of cholesterol represents 0.015 percent. This comment suggested raising the cholesterol free level for meal-type products to 5 mg per serving. The comment stated that at the 5 mg level, 60 servings of a meal-type product would be required to be consumed to meet the DRV and thus would result in ample protection for the consumer.

This comment has not convinced the agency to raise the level for "cholesterol free" for meals and main dishes. The agency acknowledges that 2 mg of cholesterol in a meal/main dish product will be a much smaller percentage by

weight than a small serving size product but points out that these percentage differences also occur with individual foods that vary considerably in serving size weight. The agency continues to believe that the same cholesterol level for the definition of "free" should be used for meal-type products as for individual foods, because it is defining "free" as an absolute term implying absence of a nutrient in a serving of food, irrespective of the serving size of the food in question. Accordingly, the agency has retained the proposed cholesterol levels in the final rule, including the disclosure statement allowed for ingredients commonly understood to contain the nutrient in question.

3. Definition of "low" and "very low" for meal-type products

a. Basis for claims

In the general principles proposal, FDA proposed that the definition of "low" and "very low," when describing the content of single nutrients in meal-type products, be based on nutrient levels per 100 g. The proposal stated that this approach would alleviate the need to accommodate the variations in serving size for the various types of meals. The agency proposed that the nutrient levels per 100 g, except for calories, be the same levels for meal-type products as for individual foods. As part of the rationale for proposing specific levels of nutrients for the "low" definition of individual foods (56 FR 60421 at 60440), the agency considered that the "low" definition should be sufficiently restrictive to allow consumers to select a variety of foods, including some that are "low" in a nutrient and some that are not "low," and still meet current dietary recommendations.

256. Many comments supported using amounts of nutrients per 100 g as the basis for regulating "low" and "very low" claims on meal-type products. One of these comments stated that this is the only workable approach because of the wide variety of products and the range in net weights encompassed within meal-type products. However, another comment stated that meal-type foods should have to meet the same criteria (i.e., a per serving rather than per 100 g basis for claims) as single item foods to qualify for nutrient content claim. An additional comment expressed the view that an approach based only on nutrient amounts per 100 g would allow many claims on meal-type products that would be prohibited on individual foods. This comment and two other comments suggested, for example, that FDA consider requiring that a meal-type product obtain no more than a certain percentage of its calories from fat (e.g., 20 percent) in order to qualify for a "low fat" claim. Two other comments supported upper limits for "low calorie" claims, with one comment recommending an upper limit of 300 calories and another recommending an upper limit of 350 calories.

FDA agrees with the majority of comments that support the use of per 100 g as the basis for regulating "low" and "very low" claims on meal-type products. FDA does not agree with the comment that meal-type products should have to meet the same criteria as single foods because meal/main dish products are generally a larger part of the total diet than single foods.

The agency has not been persuaded by these comments that there is a need or an appropriate basis for establishing upper limits for absolute amounts of calories or nutrients per serving when a claim for "low" is made. Rather, the agency believes that providing for the level of the nutrient per 100 g of food is generally sufficient to prevent misleading claims on meal-type products. While FDA has usually assumed that food consumption patterns generally reflect 3 meals per day and a snack (with about 25 percent of daily intake for each), the agency notes that even if a meal-type products weighs as much as 400 g, the absolute amount of a nutrient or calories consumed would be relatively low and thus consistent with the claim. For example, a 400 g meal could contain no more than 12 g of fat, which is only about one-fifth of the DRV.

Moreover, meal size will increase and decrease as a function of the number of servings of individual foods in the meal-type product. Larger persons in need of more calories and greater amounts of nutrients are expected to select a meal comprised of more servings of an individual food or of more servings of different foods (hence a larger meal) than would be expected to be selected by a smaller person. Thus, a basis for determining an absolute amount of a nutrient that would preclude the product from being considered "low" in a particular nutrient is problematic.

However, FDA is persuaded by comments that it is appropriate to require that meal-type products contain no more than a certain percentage of calories from fat. The agency recognizes that it is possible for certain meal-type products to contain no more than 3 g of fat per 100 g of product and still derive more than 30 percent of their calories from fat. FDA is concerned that claims be consistent with dietary guidance. Current recommendations are that 30 percent or less of calories from fat and less than 10 percent of calories from saturated fat. These recommendations are targeted toward the total diet, and the agency has stated in this document several times that they should not be applied to individual foods. However, the agency believes that a meal-type product makes a significant contribution to the diet and, thus, finds that it is appropriate to apply these total diet-oriented recommendations to meal-type products. By their nature, meal-type products are not single foods but combinations of foods intended to contribute a larger amount to the diet than a single food.

FDA has therefore concluded that "low fat" or "low saturated fat" claims on meal-type products that have more than 30 percent of calories from fat or 10 percent or more of calories from saturated fat are misleading to consumers and inconsistent with dietary guidance. Accordingly, the agency is providing in new § 101.62(b)(3)(i) that meal-type products that contain 3 g or less of fat per 100 g and derive 30 percent or fewer of their calories from fat may bear a "low fat" claim. Likewise, the agency is providing in new § 101.62(c)(3)(i) that meal-type products that contain 1 g or less of saturated fat per 100 g and derive less than 10 percent of their calories from saturated fat may bear a "low saturated fat" claim.

b. "Low calorie"

257. In the general principles proposal, FDA requested comments on whether the criterion of 105 calories per 100 g of product for "low calorie" meal-type products was too low. A few comments from industry recommended that the level be raised from 105 calories per 100 g to 120 calories per 100 g. One of these comments was submitted by the organization that had previously suggested the 105 calories that became the level in FDA's proposal. At least one comment suggested that FDA not establish an upper limit for calories in a serving. However, a foreign government suggested an upper limit of 300 calories, and a well-known health organization suggested 350 calories as the upper limit. Another comment maintained that the proposed criterion of 105 calories per 100 g was arbitrary and did not bear any relation to the definition of "low calorie" for individual foods. This comment further maintained that a weight-based criterion was not necessarily relevant, that a "low calorie meal" was a contradiction in terms, and that consumers did not need this provision because of the availability

of comparative claims. An additional comment recommended that the number of calories be disclosed next to the nutrient content claim for meal-type products.

First, FDA disagrees with the comment that the agency should not provide a separate definition for "low calorie" for meal-type products because of the availability of comparative claims. Obesity is a major public health concern and the agency has long acknowledged that the availability and marketing of low calorie food products helps to promote weight control among American consumers. The agency has made provisions for absolute claims (such as "low") as well as comparative claims (such as "reduced") on individual foods, and, given that meal-type products are combinations of individual foods, finds no reason why such claims on meal-type products would not be helpful to consumers.

Secondly, as discussed in response to the previous comment, the agency has established no upper limit for nutrient or calorie levels in meal-type products making nutrient content claims, but instead believes that the amount per 100 g of food provides sufficient control so that claims are not misleading to consumers and are consistent with current dietary recommendations.

The agency acknowledged in its general principles proposal (56 FR 60421 at 60455) that establishing a definition for "low calorie" meal-type products was problematic but accepted the suggestion put forth in a comment that 105 calories per 100 g of food was reasonable and consistent with market practices. FDA specifically asked for comments on this issue. Little support was expressed for this level, while several comments suggested that the level be raised from 105 calories to 120 calories per 100 g.

FDA finds that it is appropriate to increase the definition to this level. The agency notes that 120 calories per 100 g of food is low enough to allow consumers to select different types of meal-type products during the day, including some that are "low" in calories and some that are not "low," and still consume calories at a level consistent with weight control goals. For example, even if a meal product weighs 400 g it would be limited to no more than 480 calories. This calorie amount is less than one-fourth of the average recommended energy allowance for most adult age/sex groups (Ref. 28). Accordingly, FDA is revising new § 101.60(b)(3)(i) to provide that to qualify for a "low calorie" claim, a main dish or a meal product contain 120 calories or less per 100 g.

c. "Low sodium"

258. Several industry comments supported raising the level of sodium that would justify a "low sodium" claim on meal-type products to 200 mg per 100 g. One comment stated that the 140 mg per 100 g level is more appropriate for medically supervised therapeutic diets to manage serious health conditions than for the general population or for many individuals on restricted diets. The comment further stated that the 140 mg per 100 g level would inhibit, if not effectively preclude, the marketing of meal-type products to persons interested in restricting sodium intake. Another comment stated that they knew of no products that would qualify for "low sodium" at the 140 mg per 100 g level, while other comments maintained that products below the 140 mg per 100 g level would have an unacceptable flavor profile. Still another comment stated that for a 10 ounce product, the 200 mg per 100 g level would represent one-fourth of the sodium DRV. The comment further stated that this definition for "low sodium" is reasonable because it provides sufficient room for consumption of other sodium-containing foods during the day while remaining within the DRV. Additional comments stated that current USDA guidelines for low sodium meals require that sodium content be no more than 560 mg for a four component dinner (minimum weight 10 ounces), which is a level to which consumers have grown accustomed.

The agency is not persuaded that the 140 mg of sodium per 100 g level for meal-type products should be raised, or that the level is too restrictive for products marketed to the general population. This level is consistent with the level for individual foods. Further, FDA believes that meal products labeled "low" should be low enough in a nutrient to allow a consumer to eat several such products and still have a significant reduction in total daily intake in the particular nutrient when compared to the DRV for that particular nutrient. The agency notes that with the 140 mg/100 g level, a meal product that weighs as much as 400 g could have no more than 560 mg of sodium. However, with the higher suggested level of 200 mg/100 g, a meal product at this weight could have as much as 800 mg of sodium, which is one-third of the sodium DRV (i.e., 2,400 mg). This level would be too high for a low sodium claim on a meal product, given the assumption of a daily food consumption pattern that includes three meals and a snack (with about 25 percent of daily intake contributed by each).

The agency acknowledges that many products now on the market would not qualify for "low sodium" with the criterion of 140 mg per 100 g but does not believe that currently marketed foods should be the driving force for a "low" definition. Accordingly, FDA has retained the 140 mg per 100 g level in new § 101.61(b)(5)(i).

d. Other sodium claims

259. One comment recommended that in addition to "low sodium," "moderate sodium" be defined as a nutrient content claim on meal-type products for levels of sodium higher than "low." This term was recommended to allow consumers interested in modifying sodium intake a wider choice of products.

The agency believes that the existing nutrient content claims "low sodium" and "very low sodium" are adequate to provide information about sodium content to consumers wishing to limit their sodium intake. The comments did not provide any support for an additional term. The agency believes, for reasons discussed above, that the number of nutrient content claims should be limited. The additional term suggested in the comment is likely to confuse the consumer and possibly reduce the effectiveness of the other nutrient content claims for sodium. Furthermore, consumers interested in modifying their sodium intake will be able to refer to the nutrition label to determine if the product meets their personal dietary needs. Accordingly, the agency is not defining "moderate sodium" for meal-type products.

e. "Low fat"

260. Two industry comments supported defining "low fat" for meal-type products as no more than 3.5 g per 100 g instead of no more than 3 g per 100 g as FDA proposed. One of these comments stated that most meal-type products contain meat or poultry, and in order to use these ingredients, even lean cuts, the fat content will often be greater than 3 g per 100 g because of the meat requirements. The 3.5 g level, it was argued, would provide consumers with a greater number and variety of products available to them.

As it stated in the general principles proposal (56 FR 60421 at 60455), the agency believes that the fat level for meal products and main dish products should be consistent with the level for individual foods. Such consistency will minimize consumer confusion and assist consumers and health professionals in recalling and using

these definitions. The agency acknowledges that a number of meal-type products may not be able to make "low fat" claims. However, the term "lean" will be available to these products. FDA has retained the proposed level of 3 g or less per 100 g for a "low fat" claim in new § 101.62(b)(3)(i).

f. "Low saturated fat"

261. A few comments supported the proposed "low saturated fat" definition of no more than 1 g of saturated fat per 100 g for a meal-type product. Two comments, however, recommended that "low saturated fat" for all food products be defined as no more than 1 g of saturated fat per serving or no more than 7 percent calories from saturated fat.

As discussed in comment 256 of this document, the agency believes that nutrient amounts per 100 g should be the basis for regulating "low" claims on meal-type products. However, as discussed in comment 256 of this document, the agency is establishing an additional criterion in new § 101.62(c)(3)(i) that a meal-type product derive less than 10 percent of its calories from saturated fat in order to bear a "low saturated fat" claim.

g. "Low cholesterol"

262. Two comments recommended that FDA define "low cholesterol" for all meal-type products as no more than 20 mg of cholesterol per serving or no more than 15 mg cholesterol per 100 nonfat calories.

The agency is not persuaded to adopt this alternative criterion because, as previously stated, it believes that it is inappropriate and would confuse consumers to have a primary criterion for a "low" claim that links the amount of total fat in a food to the food's ability to make a "low" claim for another nutrient. However, the agency is including in the "low cholesterol" definition of meal-type products in new § 101.62(d)(3) a criterion that requires that a meal product contain no more than 2 g of saturated fat per 100 g. The agency has established this additional criterion under the authority in the 1990 amendments to establish a saturated fat limit with cholesterol claims. Section 403(r)(2)(A)(vi) of the act states that a nutrient content claim "may not be made if the Secretary by regulation prohibits the claim because the claim is misleading in light of the level of another nutrient in the food." As discussed above in response to comment 116 of this document, the agency believes that a saturated fat level that exceeds 2 g would make a cholesterol claim misleading because consumer expectations would not be met if such a food is not consistent with the recommendations of the health and dietary guidelines to lower blood cholesterol levels by limiting cholesterol and saturated fat intake. Thus, with respect to "low cholesterol" claims on meal-type products, the agency concludes that consumer expectations regarding blood cholesterol levels are met as long as the food contains 20 mg or less of cholesterol and 2 g or less of saturated fat per 100 g.

4. Definition of "percent fat free" for meal-type products

263. A few comments supported the proposed requirement that a meal-type product meet the "low fat" definition to make a "percent fat free" claim, whereas another comment stated that "percent fat free" claims can be particularly deceptive on meal-type products because many of these products, such as frozen dinners, have a high moisture content. The latter comment further stated that because moisture contributes significantly to a product's weight, foods with a high moisture content can make higher (more impressive) "percent fat free" claims than foods with lower moisture levels. The comment pointed out that a label on an 18 ounce frozen dinner containing 15 g of fat could make a "97 percent fat free" claim.

The agency is not persuaded by the latter comment that a "percent fat free" claim on an 18-ounce dinner that meets the "low fat" definition would be deceptive. Regardless of the total weight of the dinner, it still contains 3 g or less fat per 100 g, is a "low fat" meal-type product, and would assist consumers in limiting their fat intake. Thus, the agency finds that a percent fat free claim on meal-type products that meet the "low fat" definition, regardless of the serving size of the product, is not deceptive and can be useful in assisting consumers in meeting their dietary goals.

5. Definition of "high" and "good source"

In the general principles proposal (56 FR 60421 at 60457), FDA proposed that for meal-type products, the nutrient levels for "high" and "good source" be the same percentages of the DRV or RDI as for individual foods, but that the basis for these nutrient levels be per 100 g, not per serving. The agency proposed in § 101.54(b)(2) that "high" be defined as 20 percent or more of the DRV or RDI per 100 g of product, and in § 101.54(c)(2) that "good source" be defined as 10 to 19 percent of the RDI or DRV per 100 g of product.

While one comment supported the use of a per 100 g basis for the definitions of "high" and "good source," a few comments opposed this basis. For the reasons cited below, the latter comments have persuaded the agency to reconsider the basis for "high" and "good source" claims for meal products and for main dish products.

264. One comment recommended that FDA base its definition of "high" and "good source" for all foods including meal-type products on a criterion that considers the nutrient/caloric contribution of a food. This comment proposed that "good source" be defined as at least 10 percent of the DRV or RDI per serving and at least 10 percent of the DRV per 200 calories. Similarly, "high" would be defined as at least 20 percent of the DRV or RDI per serving and at least 20 percent of the DRV or RDI per 200 calories.

The agency rejects this alternative because it could result in plain vegetable products being able to make a claim for "high in vitamin C," but a similar product with these vegetables in a sauce not being able to make this claim. The additional calories contributed by the sauce would cause the product not to meet the minimum DRV level per 200 calories. Such an approach to defining these claims would create inconsistencies in the use of the claims and could cause consumer confusion.

265. Several comments stated that the per 100 g basis would result in inappropriately high nutrient levels for meal-type products eligible to make "high" or "good source" claims. For example, it was stated that to make a "high in fiber" or "high in vitamin C" claim, a 10-ounce frozen dinner would be required to contain over one-half of the DRV or RDI. The comments stated that products that contain a smaller percent of the DRV or RDI still may be considered excellent nutrient sources. Alternatively, one comment recommended that the basis for the definitions of "high" and "good source" for meal-type products be per labeled serving rather than per 100 g of food.

FDA is persuaded, for the reasons given in the comments, that the per 100 g basis would result in inappropriately high nutrient levels for meal-type products. The per 100 g basis would require that a 10-ounce meal-type product have at least 30 percent of the DRV to be labeled a "good source" of a nutrient, or at least 60 percent of the DRV or RDI to be labeled "high" in a nutrient. The agency acknowledges that some meal-type products on the market meet these definitions, but it is

concerned that the proposed levels may encourage increased fortification of these products, with little benefit to the consumer.

Furthermore, the agency is not persuaded to adopt the suggested alternative to define "good source" and "high" using the same percentage levels as individual foods per labeled serving because it would be misleading to state on a label that a three component meal is "high" in a nutrient, when each of the three components may only have 6 percent of the DRV or RDI.

Having considered the alternatives for defining "high" and "good source" claims for meal-type products and finding inadequacies in each, FDA now concludes that such claims should not be defined for meal-type products. FDA is, therefore, not providing definitions for "high" and "good source" claims for meal products and main dish products. The agency concludes that it would not be misleading, however, to state on a label that a specific individual food in a meal-type product is a "good source" of a nutrient or is "high" in a nutrient if that food meets the individual food criteria for these claims.

Accordingly, FDA is revising new § 101.54(b)(2) and (c)(2) to allow "high" and "good source" claims for a food contained in the meal product or main dish product provided that the food meets the individual food criteria for these claims and provided that this food is identified with the use of the nutrient content claim (e.g., "The serving of broccoli in this product is high in vitamin C;" "The serving of sweet potatoes in this product is a good source of dietary fiber").

6. Relative claims for meal-type products

FDA also proposed definitions for "less" and "fewer," "more," "reduced," and "light" for individual foods in the general principles proposal (56 FR 60421 at 60456). With the exception of the terms "reduced" and "light," FDA proposed that the provisions for individual foods apply to meal-type products.

Some of the comments, as discussed below, have persuaded the agency to change the basis for "less," "fewer," and "more" claims and to provide for "reduced" and "light" claims on meal products and main dish products.

a. "Less," "fewer," and "more"

FDA proposed requirements for "less" and "fewer" claims on meal-type products that were consistent with the requirements for these claims on individual foods. The proposed provisions included a requirement that the product have a minimum percentage and absolute reduction of a nutrient per labeled serving size compared with the reference food that it resembles and for which it substitutes. For "more" claims, the proposed requirements included a provision that the product contain at least 10 percent more of the DRV or RDI for a nutrient per labeled serving than the reference food that it resembles and for which it substitutes.

However, information provided in comments has persuaded the agency to revise the proposed requirements for the percent nutrient reduction and absolute nutrient reduction for the use of the comparative claims "less" and "fewer" on meal-type products. The agency has also revised new § 101.13(j)(1) with regard to reference foods, as previously discussed in this document. This revision applies to meal products and main dish products as well as to individual foods.

266. One comment suggested that the criteria for comparative claims on meal-type products should be based on a percentage difference in a nutrient per 100 g of food compared with per 100 g of the reference food. This comment pointed out that meal-type products include a wide variety of types of foods and a range of serving sizes. It further stated that claims that compare dissimilar products, such as a two component product to a three component product or spaghetti and tomato sauce to macaroni and cheese, would only lead to consumer confusion and misinterpretation of the claim.

The agency agrees that both the meal and main dish categories include products that vary substantially in the number of foods, type of foods, and size of the labeled serving, and that claims that compare dissimilar products on a per labeled serving basis have the potential to confuse consumers. For example, the only difference between two products that may bear a comparative claim under the proposed criteria may be the amount of the food components. The agency has also considered that comparative claims based on FDA's proposed labeled serving size may encourage manufacturer manipulation of serving size to make these comparative claims, given the fact that the labeled serving size for many of these products is the single serve container rather that the reference amount.

Thus, the agency finds merit in the comment's suggestion to base a comparative claim for meal-type products on a per 100-g criterion rather than per labeled serving size. A per 100 g basis reflects the composition of the product based on an absolute amount and not a serving size that can vary from one product to another. Moreover, a per 100-g criterion is likely to not encourage manipulation of serving size because the serving size will have no bearing on whether the food qualifies to bear the claim. Thus, a claim will result in more meaningful comparisons of dissimilar products.

Accordingly, the agency is establishing a per 100 g basis for the use of these comparative terms on meal/main dish products in new §§ 101.54(e)(2)(i), 101.60(b)(5) and (c)(5), 101.61(b)(7), 101.62(b)(5), (c)(5), and (d)(5). Like other relative claims, a statement that identifies the reference food and the percentage change in the nutrient must be declared in immediate proximity to the most prominent claim (e.g., Contains 33 percent less fat per ounce than Brand Y meal product.). Moreover, quantitative information comparing the level of the nutrient that is the subject of the claim in the labeled food to the level of that nutrient in the reference food must be declared either adjacent to the most prominent claim or on the information panel (e.g., Fat content has been reduced from 2.5 g per ounce to 1.7 g per ounce.). In addition, consistent with the use of relative claims on individual foods, meal or main dish products may not bear comparative claims if the level of the nutrient that is the subject of the claim in the reference foods meets the definition for a "low" claim for such nutrient.

267. One comment contended that the agency's published correction (57 FR 8189, March 6, 1992) of the minimum absolute reduction criterion in the definition of "fewer calories" from "more than 40 calories" to "more than 105 calories" must be withdrawn from this rulemaking because it changes the substance of the proposal, and the agency is not permitted to make a substantive proposal in a notice of correction.

The agency disagrees with the comment. In proposing the absolute minimum reduction criterion for making comparative claims, the agency concluded that the amount of nutrient in the food bearing the claim should reflect a nutritionally significant reduction in the amount of that nutrient when compared to the reference food. The agency recognized, however, that no guidelines or definitions were available to determine the amount of reduction in a nutrient that would be nutritionally significant. Thus, the agency tentatively concluded that such a criterion should be based on the amount specified in the definition of "low" for the nutrient in question. The

agency applied this rationale to individual foods as well as to meal type products. The amount specified in the proposed definition of "low calorie" for meal-type products was 105 calories per serving. Thus, it was clear that the intent of the agency was to propose an absolute minimum reduction criterion for comparative claims for decreased levels of calories for meal-type products as "more than 105 calories." Therefore, the notice of correction did not make a substantive change in the proposal but only an editorial change.

b. "Reduced"

FDA proposed not to provide for the use of "reduced" claims on meal-type products because it was of the opinion that there was an insufficient basis on which to establish a reference criterion. In the general principles proposal (56 FR 60421 at 60456), the agency stated that meal-type products may have the same basic ingredient, e.g., fish, but may differ in their preparation and in added ingredients. Consequently, the agency expressed concern that such a provision could result in inappropriate comparisons of dissimilar products.

268. One comment agreed that FDA should not allow "reduced" as a nutrient content claim for meal-type products, whereas a few comments recommended that the term be permitted. One of the latter comments recommended that a single set of criteria for all comparative terms be applied to meal-type products. Thus, the same definitions would be used for "reduced," "less," "fewer," and "light." Another comment was specifically concerned that there was no definition for "reduced fat" and "reduced cholesterol" meal-type products. An additional comment stated that manufacturers should be permitted to make a "reduced" claim for a meal-type product if the recipe has been changed to effect a meaningful reduction in a nutrient from the previous recipe, and that to disallow "reduced" on these products would be a serious disincentive for manufacturers to improve their products' nutritional profiles and a disservice to consumers.

In response to these comments, the agency has reconsidered its proposal to disallow "reduced" claims on meal-type products. In another section of this document, the agency has concluded that comparisons using the term "reduced" are only appropriate for use in comparing similar foods, i.e., a reformulated version of a manufacturer's product to the original product (e.g., a lasagna meal-type product that uses low fat ricotta cheese and lean meat may bear the claim "reduced" when the original product uses regular ricotta cheese and meat, whereas a lasagna with low fat ricotta cheese that substitutes spinach for the meat portion could not bear a "reduced" claim but may bear a "less" claim with respect to the original product). This revised position of the agency is consistent with the comment that recommended that "reduced" be allowed on meal-type products that have been reformulated and addresses the agency's earlier concerns, as stated in the general principles proposal (56 FR 60421 at 60456), that "reduced" not be used to compare dissimilar products. Accordingly, the agency is establishing similar provisions for use of the term "reduced" on meal-type products in new §§ 101.60(b)(5) and (c)(5), 101.61(b)(7), 101.62(b)(5), (c)(5), and (d)(5). In addition, the agency advises that if the manufacturer should discontinue the original product used as the basis for the "reduced" claim, the use of the "reduced" claim is limited to a maximum of 6 months after the original product has been removed from the market. As with other comparative claims such as "less," these provisions will require that the comparisons be based on per 100 g of the product, so that "reduced" claims will not be subject to manipulation by reducing the label serving size (e.g., reduced fat—33 percent less fat than our former recipe. Fat content has been lowered from 1.7 to 1.1 g per ounce).

c. "Light"

FDA did not propose a definition for "light" for meal-type products in its general principles proposal because, similar to "reduced" claims, the agency could not identify appropriate reference foods to permit this use of the claim (56 FR 60421 at 60456). However, the agency tentatively concluded that the term "light" could be useful to consumers in selecting products that contain fewer calories than would be expected in a normal meal and asked for comments on the need for, and definition of, this term on meal-type products. The agency stated that it was considering allowing the term "light" to be used if a meal-type product met the criteria for a "low calorie" claim, provided that the product did not contain more than one-fourth of the DRV for fat, saturated fat, sodium, or cholesterol. The agency noted that the proposed "low calorie" level for a 10-ounce meal product (i.e., 105 calories per 100 g or 300 calories per 10 ounces) was nearly one fourth of the calorie intake in a calorie-restricted diet of 1,200 calories a day. FDA further stated that the requirement that these four nutrients not exceed one-fourth of the DRV would ensure that "light" meal-type products would not contribute amounts of these nutrients that would cause total daily intake to exceed recommended values.

269. One comment agreed with FDA's suggested definition of "light" for meal-type products (i.e., a "low calorie" meal-type product that contained no more than 25 percent of the DRV for fat, saturated fat, cholesterol, and sodium). Several comments, however, offered alternative definitions for the use of the term on meal-type products. A few comments suggested that comparative criteria be used to define "light" for meal-type products. One comment recommended that the definition for "light" for meal-type products be consistent with the definition of "light" for other foods. In addition, this comment stated that meal-type products should meet the per 100-g criterion. Other comments recommended that a "light" claim be permitted on meal-type products if a food product meets the definition for a "low nutrient" product, or if the product achieved a reduction of at least 25 percent of calories. One of these comments stated that there may be some instances when there will be an appropriate reference food to which a comparison could be made.

The agency's general approach in defining nutrient content claims is to try to define terms as consistently as possible for all types of food. Thus, if the agency were to adopt comparative criteria for "light" claims for meal-type products, it would be consistent with the criteria that it has established for use of this term on individual foods. However, the agency believes that in the case of meal-type products, there is only a limited group of appropriate reference foods for use with comparative claims. Meal-type products vary greatly in the number and type of ingredients as well as in labeled serving size, and as one comment stated, meal-type products, other than reformulated meal-type products do not truly "substitute" for a definable reference food as do individual foods. The agency is providing for the use of "reduced" on those meal-type products that are reformulated, and it considered whether the term "light" might also be appropriately used on these products. Limiting the use of "light" on meal-type products to only reformulated products would, however, greatly limit the number of such products that could bear this term. The agency has concluded that because of its widespread appeal and its potential usefulness in denoting foods that can assist consumers in maintaining healthy dietary practices,

the use of this term should not be so limited. Accordingly, the agency has rejected the suggestions to use criteria that compare a product with a reference food in defining "light" for meal-type products.

270. A few comments recommended that the term "light" not be permitted on meal-type products. Two of these comments stated that products meeting the criteria for a low calorie meal would already meet consumer expectations, and therefore a "light" claim is unnecessary. Comments further noted that eliminating unnecessary terms and different criteria for the same term would help reduce consumer confusion.

The agency does not agree with the comments that contended that the use of the term "light" is without value on meal-type products. As explained above in the section on "light" claims for individuals foods, the terms "light" and "light in sodium" in comment 185 are terms that have special usefulness as marketing tools for manufacturers to quickly and easily convey to consumers that the product to which the term is attached has been significantly reduced in fat, calories, or sodium. Furthermore, available data and comments show that products labeled as "light" are particularly useful in achieving a diet that is consistent with dietary guidelines.

Thus, the agency has concluded that provisions for the use of the terms "light" and "light in sodium" on meal products and main dish products that require (as discussed below in comment 272 of this document) that meal-type products bearing such claims meet the definition of "low calorie," "low fat," or "low sodium" will assist consumers in implementing dietary recommendations with respect to limiting caloric, fat, and sodium intake. Further, as reflected in the legislative history (136 Congressional Record 16609 (October 24, 1990)), Congress' intent was to permit the use of the comparative claim "light" for entrees, meals, dinners (i.e., meal-type products). Accordingly, the agency rejects the suggestion to not allow this term on meal-type products.

271. One comment contended that FDA's calorie criterion for "light" (i.e., no more than 105 calories per 100 g) was too restrictive. This comment recommended that "light" be allowed on products that contain no more than 450 to 550 calories (or about one-fifth to one-fourth of a 2,350 calorie diet).

FDA has made a number of changes that have had the effect of making this criterion not as restrictive as this comment contended. The agency has modified the criterion, as discussed above, to 120 calories per 100 g and is basing its dietary calculations on a 2,000 calorie diet, as discussed in the document on RDI's and DRV's, published elsewhere in this issue of the Federal Register. Thus, a "light" claim will be allowed on a 300 g (approximately 10 oz) meal if it contains no more that 360 calories.

272. Some of the comments also addressed what nutrients in addition to calories should be limited for a meal-type product to qualify for a "light" claim. One comment suggested that the term "light" as applied to meal-type products should focus on healthfulness rather than low calorie, while another comment stated that the conceptual basis of "light" should be different from "healthy." The latter comment stated that "light" claims should be allowed on meal-type products that are "low calorie," "low fat," or both, with the relevant expressed claim (e.g., "low in calories) appearing in close proximity to the "light" claim. This comment stated that the term has been widely used to enable consumers to select products that contain less fat or fewer calories than would be expected in a normal meal. However, this comment specifically objected to the proposal's suggestion of not allowing more than 25 percent of the DRV for fat, saturated fat, cholesterol, and sodium for a "light" claim to be made. Other comments agreed that there should be no restrictions on these four nutrients, whereas another comment stated that the restrictions should correspond to one-eighth of the DRV, rather than one-fourth, because the maximum permitted level of about 300 calories for a 10 ounce product would correspond to one-eighth of the reference caloric intake of 2,350 calories.

FDA has reconsidered what nutrients should be limited in a meal-type product for it to be permitted to bear a "light" claim. FDA is persuaded by the comment that an unqualified "light" claim on meal/main dish products may appropriately refer to fat, calories, or both. However, as discussed in comment 269, the agency has determined that for meal-type products, "light" should not be limited to reductions in the level of nutrients in existing foods. Rather, the agency is persuaded by the comments that the term should denote those meal-type products in which the level of the nutrients are particularly useful in constructing a diet that is consistent with dietary guidelines, that is, the term should be permitted on foods that are "low in calories," "low in fat," or both. The agency notes that a provision for "light" to refer either to calories or to fat is consistent with the definition of "light" for individual foods that have less than 50 percent of calories from fat. It is also consistent with consumer understanding of this term. FDA is also persuaded, however, that a statement that explains whether "light" is used to mean "low in fat," "low in calories," or both should appear on the principal display panel to clarify the nature of the claim for consumers who may be interested in limiting only calories, only fat, or both (§ 101.56(d)(2)(i)). Furthermore, to ensure that this explanatory statement is sufficiently prominent relative to the "light" claim, FDA concludes that it should be in no less than one-half the type size of the "light" claim (new § 101.56(d)(2)(ii)). This requirement is also consistent with the final rule on "light" claims on individual foods that requires that qualifying statements of sufficient type size must accompany the claim.

Accordingly, FDA is defining "light" for meal products and main dish products in new § 101.56(d). To meet this definition, a meal product or main dish product must meet the definition of "low" for calories, fat, or both (new § 101.56(d)(1)). Further, the agency believes that for consistency with individual foods, it should provide for use of the additional claim "light in sodium" on meal-type products. As with individual foods, the agency has determined that the words "light in sodium" or "lite in sodium" is a single descriptive term, presented in the manner described above, that should all be presented in the same type size, style, color, and prominence. Further, the agency believes that such a "light in sodium" claim for meal-type products should be based on the same criteria as the "light" claim for other nutrients for meal-type products, i.e., it should be based on the "low" definition for the specified nutrient. Accordingly, the agency is defining "light in sodium" for meal-type products in new § 10.56(d)(2). To qualify to make this claim, a meal product or a main dish product must meet the definition of "low" for sodium (new § 101.61(b)(5)(i)). However, because the nutrient that is the subject of the claim is identified as part of the claim i.e., the defined term is "light in sodium," the agency believes that the additional defining label statement (i.e., "low in sodium") that is required with other "light" claims on meal-type products would be redundant. Therefore, the agency is not requiring this additional information to be stated adjacent to the claim.

FDA has also reconsidered whether the definition of "light" should require that fat, saturated fat, cholesterol, and sodium not exceed specified levels in a

product. The agency has no evidence that would suggest that consumers who use "light"roducts expect these products to have restricted levels for all of these nutrients, especially if the "light" claim is clarified by a statement that identifies the nutrients that are the subject of the claim. Further, if the levels of any of these nutrients were sufficiently high in a product, the product will have to bear a disclosure statement referring the consumer to the nutrition information panel that discloses the amount of the nutrient (new § 101.13(h)(2) and (h)(3)). Accordingly, the agency is not including in the definition of "light" restrictions on the amount of saturated fat, cholesterol, or sodium.

7. Definition of "lean" and "extra lean" for meal-type products

As discussed elsewhere in this document, although FDA did not propose to define "lean" or "extra lean" in the general principles proposal, the comments have persuaded the agency to adopt the provisions that the FSIS is establishing for "lean" and "extra lean" for meat and poultry products, including meal-type products, regulated by USDA. FDA is providing for the use of the term "lean" and "extra lean" to describe FDA regulated products comparable to those covered by the FSIS regulation. The criteria that FDA is adopting for "lean" as used to describe meal and main dish products are provided in new § 101.62(e)(2) and "extra lean" as used to describe meal and main dish products are provided in new § 101.62(e)(4).

Accordingly, the provisions in new § 101.62(e)(2) require that for the term "lean"o be used on the label or in labeling of a meal product or main dish product that product must contain less than 10 g of fat, less than 4 g of saturated fat, and less than 95 mg of cholesterol per 100 g and per labeled serving. The provisions in new § 101.62(e)(4) require that for the term "extra lean" to be used on the label or in labeling of a meal product or a main dish product that product must contain less than 5 g of fat, less than 2 g of saturated fat, and less than 95 mg of cholesterol per 100 g and per labeled serving.

The agency recognizes that the definitions for "lean" and "extra lean" for main dish products allow for use of the claim when levels of cholesterol exceed FDA's disclosure levels for this nutrient in a main dish product (i.e., 90 mg). It considered whether to prohibit the claim on products that contained greater than 90 mg of cholesterol. However, the agency has concluded that it would be more beneficial to consumers to allow the claim on meal-type products whose cholesterol content exceeds the disclosure level because the claims identify foods relative to other foods in this broad category of foods that contain lower amounts of fat and saturated fat. Consequently, these changes will assist consumers in selecting such foods. Furthermore, when the level of cholesterol exceeds FDA's disclosure level, the food will be required to bear a disclosure statement that refers the consumer to the nutrition information panel for additional information about cholesterol content.

8. Disclosure statement

In the general principles proposal (56 FR 60421 at 60457), the agency applied the concept of disclosure levels for individual foods to meal-type products. However, the agency did not propose specific disclosure levels for meal-type products and solicited comment on whether the disclosure levels should be different for meal-type products than for individual foods, and if so, what the levels should be and why.

273. FDA received comments recommending that it provide separate disclosure criteria for meal-type products. Several comments argued that the single food disclosure levels were too stringent to be applied to large quantities of food such as meal-type products. Two comments suggested that a specified amount of the designated nutrient per 100 g of product was the most appropriate basis for a criterion.

The agency considered whether to retain the disclosure levels for individual foods as the disclosure levels for meal-type products but on a per 100 g basis rather than per serving (i.e, 13 g of total fat, 4 g of saturated fat, 60 mg cholesterol and 480 mg sodium). On this basis, a meal weighing 10 ounces (280 g) would be subject to the disclosure requirements if it contained approximately 36 g of fat or 55 percent of the DRV. A single meal product weighing 12 ounces (336 g) would be subject to the disclosure requirement if it contained about 44 g of fat or about 67 percent of the DRV for total fat. If it is assumed that a "meal constitutes one-fourth of a total day's nutrient/calorie intake, this criterion appears to be too high in that such a meal could contribute more than half of the total amount of the nutrient (i.e., fat, saturated fat, cholesterol, or sodium) generally recommended as a total daily intake, not be required to bear a disclosure, yet still be able to bear a health claim.

The comments received offered no alternatives to the per 100 g basis for disclosure levels for main dishes and meal products. FDA, therefore, has developed an approach that extends the rationale used for individual foods to main dishes and meal products. This approach allows a greater percentage of the DRV for main dish products and meal products than for individual foods.

In arriving at specific percentage levels for disclosure nutrients, FDA considered that the amount of a nutrient in the total daily diet that may increase the risk of a disease may be between 100 percent and 200 percent of the DRV for that nutrient. The agency then considered that if three meals and a snack were consumed during the day, and each contained 40 percent of the DRV for a particular disclosure nutrient, and if foods that sometimes accompany meals such as beverages, breads, and desserts were also consumed and contributed an additional 40 percent of the DRV for that nutrient, then the total daily intake of the nutrient would not exceed 200 percent of the DRV, the level the agency used to establish disclosure levels for individual foods (see the final rule on health claims that appears elsewhere in this issue of the Federal Register). Thus, the agency is adopting 40 percent of the DRV as the disclosure level for meal products in this final rule.

The agency further considered that the contribution of main dish products is generally between meal products and individual foods (for which a disclosure level of 20 percent of the DRV is established in this final rule). Thus, the agency chose 30 percent of the DRV, the mid-point between meals and individual foods, as the disclosure level for main dish products.

Based on the comments received, the agency has established separate disclosure criteria for meal/main dish products. For meal products, new § 101.13(h)(2) requires that a disclosure statement be made on a product that makes a nutrient content claim if the food contains more than 26 g of fat, 8.0 g of saturated fat, 120 mg of cholesterol, or 960 mg of sodium per labeled serving. These levels correspond to no more than 40 percent of the DRV per labeled serving. For main dish products, new § 101.13(h)(3) requires that a disclosure statement be made on a product that makes a nutrient content claim if the food contains more than 19.5 g of fat, 6.0 g of saturated fat, 90 mg cholesterol, or 720 mg of sodium per labeled serving. These levels correspond to no more than 30 percent of the DRV per labeled serving.

9. Other

275. The agency received a comment that recommended that the term "controlled" be defined as an implied

nutrient content claim for meal-type products. This comment asserted that this term would be very useful in describing carefully established levels of nutrients and has historically referred to established levels in a line of products designed to be used regularly within the context of a total diet that met dietary guidelines. The recommended criteria for the term "controlled" recommended by the comment were: (1) Less than 300 calories, (2) less than 30 percent of calories from fat, (3) no more than 65 mg cholesterol, and (4) less than 600 mg of sodium.

The term "controlled" has traditionally been used in the marketplace (especially on products marketed for special dietary use) to refer to designated size portions of foods and not to levels of nutrients. Thus, the agency has not defined the term "controlled" as suggested in the comment. However, the agency advises that individuals who believe that there is a need for additional terms for the use of implied claims on meal-type products may petition the agency under the provisions of § 101.69.

IV. Restaurant Foods

A. Nutrient Content Claims for Restaurant Foods

FDA received many comments regarding the proposed nutrient content claims criteria as they would apply to restaurant foods and to foods sold in other establishments in which food that is ready for human consumption is sold (e.g., institutional food service, delicatessens, catering). In this discussion, such foods will be referred to as "restaurant foods," firms selling such foods will be referred to as "restaurants," and responsible individuals in these firms will be referred to as "restaurateurs." However, the concepts and policies discussed are intended to apply broadly to the foods covered by section 403(q)(5)(A)(i) and (q)(5)(A)(ii) of the act. Issues with respect to menus are discussed separately below.

276. Several comments stated that because the 1990 amendments are silent with respect to requiring restaurant foods to comply with the requirements for nutrient content claims, FDA is not legally required to regulate such claims for restaurant foods in a manner identical to that proposed for packaged foods.

FDA disagrees with the comments that the 1990 amendments do not apply to nutrient content claims made for restaurant foods. As explained in the general principles proposal (56 FR 60421 at 60428), the 1990 amendments, fully support the agency's proposal in § 101.13(o)(5) (redesignated as new § 101.13(q)(5)) that a nutrient content claim may not be used for food that is served in restaurants or other establishments in which food is served for immediate human consumption, or for food that is sold for sale or use in such establishments, unless the claim is used in a manner that is authorized by a definition that FDA has adopted. However, FDA agrees that under section 403(r)(2) of the act, it is not required to regulate claims on restaurant foods in a manner identical to that for packaged foods. In fact, restaurants are exempt from the referral and disclosure requirements in section 402(r)(2)(B) of the act and certain of the requirements in section 402(r)(2)(A). FDA's regulations incorporate these exemptions. While the regulatory criteria governing claims for restaurant-type foods need not be identical to those governing other foods, if claims on foods are to be useful for consumers, the criteria for those claims must be consistent.

277. Several comments stated that restaurant foods should be required to comply with the proposed requirements for nutrient content claims. Some comments stated that many restaurant foods are centrally manufactured and conform to system-wide composition and quality standards. Therefore, many restaurants and restaurant chains, especially the larger ones, already have access to the nutrition information necessary to verify claims about their products. Finally, these comments stated that portion control of foods is practiced by many restaurants to control their food costs, and that this control will facilitate compliance by the industry.

Some comments stated that the proposed regulations governing nutrient content claims would be impracticable for the restaurant industry because packaged foods and restaurant foods differ markedly in the way they are prepared and sold. For example, variability in the nutrient level of individual foods sold in restaurants occurs as a result of: (1) Seasonal, regional, and market variations in ingredients; (2) differences in preparation methods of similar foods; and (3) consumer preferences in terms of how food is prepared. The comments pointed out that these variabilities would require repeated costly analyses to determine if each food meets the criteria for the content claim. The comment cited additional, complicating factors such as: performance of 100-g calculations for meal-type products; inadequacy of current data bases on nutrient levels in many foods for validating nutrient content claims; and variations in recipes for restaurant foods. One comment estimated the cost of compliance in terms of redoing printed materials in the commercial sector of the food-service industry to be more than $500 million. Additionally, the comments assert that costs associated with product development, testing, preparation, marketing, and staff training will be required. For these reasons, these comments requested that FDA exempt restaurant foods from the requirements for nutrient claims it is establishing in this final rule.

Several comments stated that the proposed regulation for nutrient content claims for restaurants is not the least restrictive alternative available to FDA, in accordance with Executive Order 12291, because it would essentially eliminate a foodservice operator's ability to communicate meaningful nutrition information to consumers and create a disincentive for foodservice operators to develop healthful foods. These comments said that substantial costs of compliance with the new regulations would be passed on to consumers, and the small business segment of the industry would be especially adversely affected. The alternatives suggested by the comments are: (1) Develop definitions for foodservice oriented nutrient content claims; (2) develop voluntary guidelines for foodservice that specify how foodservice operators should provide nutrition information, or (3) establish a standard set of criteria concerning a recommended daily diet so that foodservice operators could flexibly and reliably design meals that may be promoted as healthful.

Several comments specifically addressed the use of the term "light" on restaurant foods. One of these comments said that "light" used on a restaurant food or meal should have the same meaning as when placed on a packaged food. Another comment said that "light" should mean only a reduction in calories, and that it should be restricted to use on meal-type products, on salt substitutes, and for describing physical or organoleptic attributes. One comment said that "light" as used in a restaurant can mean a wide variety of things from lighter texture, color, or consistency to overall healthiness, and that the proposed definition was too restrictive. A comment from a restaurant chain recommended that the term "light" should be used to refer to total meal packages that have at least 25 percent less fat, cholesterol, sodium, or calories than the traditional menu selections. This comment contended that a

restaurant meal will take the place of at least three servings, and that a 25 percent reduction would be significant in terms of total diet.

Other comments were less specific in addressing the issue of restaurant foods or meals bearing relative claims. One of these comments said that relative claims should be permitted for total meal packages at restaurants. Another of these comments said that for relative claims, a restaurant should compare a product to the restaurant's own product.

Given that almost half of the American food dollar is spent on food consumed away from home, and that perhaps as much as 30 percent of the American diet is composed of foods prepared in food service operations, FDA believes that, from an overall public health perspective, this important segment of the diet cannot be ignored. Further, FDA believes that dietary information provided to consumers at point of purchase in restaurants and other food service operations can be useful in helping Americans in maintaining healthy dietary practices. FDA wants to encourage the provision of such dietary information. However, FDA firmly believes that consumers expect, and deserve, that the claims made at point of purchase are truthful and not misleading.

FDA advises that not all claims made for restaurant foods are necessarily the type of claims that are covered by the 1990 amendments. For the sake of clarification, the agency offers the following observations. Statements such as "lightly breaded," "light crust," or "in a light sauce" on a sign or placard are not nutrient content claims covered by the 1990 amendments. Moreover, because of the importance of context, statements such as "Light Fare," "Lite Bites," or "Light Entrees" will not be considered nutrient content claims if the sign or placard on which the statement appears offers an explanation of the basis for the terms that makes clear that they are not intended to characterize the level of a nutrient. For example, a term such as "Lite Fare," on a sign or placard followed by an asterisk referring to a note that makes clear that in this restaurant the term means dishes with smaller portion sizes than normal would not be considered a nutrient content claim under section 403(r) of the act. In most cases, a prominently displayed disclaimer or information that clearly explains the basis for the use of the term, and that does not characterize the level of a nutrient in the explanation, will be sufficient to remove that use of the term from the coverage of the 1990 amendments.

Similarly, a restaurant may be able to use symbols next to the listing of an item on a sign or placard where the symbols are clearly explained in terms that would not subject the claim implied by the symbol to the 1990 amendments. For example, the use of a star symbol next to the name of an entree, where the symbol is explained in a footnote stating that the item is broiled instead of fried, would not be subject to the 1990 amendments.

Also, a restaurant may use symbols or make reference on a sign or placard to the criteria of a health professional organization or accrediting group and explain that the entree or meal is consistent with the general dietary guidelines of that group and not be subject to the 1990 amendments. For example, use of a heart symbol with reference to a note that explains that this entree is consistent with the general dietary guidelines of the AHA will be considered dietary guidance and not a nutrient content or health claim subject to section 403(r) of the act, provided the explanation does not characterize the level of a nutrient.

Finally, a restaurant also may be able to devise foods or complete meals that are formulated in complete accordance with the Dietary Guidelines for Americans (e.g., moderate calories, less than 30 percent calories from fat, less than 10 percent calories from saturated fat, emphasis on vegetables, fruits, and grain products, moderate use of sugars and sodium). FDA encourages such actions because a meal, especially a restaurant meal, represents a significant portion of the day's consumption, as compared to an individual food product. A restaurateur may signal to customers by the use of a term or symbol on a sign or placard that the meal is formulated in accordance with dietary guidelines, and FDA will consider such indications to be dietary guidance and not nutrient content claims under the 1990 amendments.

FDA is including a provision in new § 101.13(q)(5)(iii) that describes when such indications will be considered to constitute dietary guidance and not nutrient content claims. The agency will evaluate the validity of such guidance on the basis of its being truthful and not misleading under section 403(a) of the act. However, if the restaurateur goes on to characterize the level of nutrients in the food, it would subject the food and the claims for the food to the nutrient content claim regime. When a restaurant uses a defined term such as "low calorie," uses the term "light" without further explanation, or uses a term or symbol that is explained in such a way that states or implies levels of nutrients in the food, it must comply with FDA's definitions of those terms.

How the restaurant demonstrates compliance with those definitions is a difficult matter. FDA recognizes that, as detailed in the comments, there are variations in the nutrient values for restaurant foods. Some of these variations are not unique to restaurants. Manufacturers of packaged foods also have to deal with differences in nutrient levels as a result of seasonal, regional, and supplier variations. FDA has been able to develop workable criteria that take into account these variations. However, the agency acknowledges that there are variations unique to restaurant foods (e.g., methods of preparation). Moreover, FDA recognizes that there are difficult questions, as demonstrated by the comments, as to how exactly to analyze restaurant foods in a reasonable and cost effective manner.

While there are difficulties associated with restaurant foods, FDA concludes that the difficulties are not so great as to preclude restaurants from making claims or to prevent the agency from being able to assure consumers that the nutrient content claims that appear on restaurant foods reasonably reflect the nutrient content of the food. Thus, FDA is providing in new § 101.13(q)(5)(ii) that, except if a claim is made on a menu, a restaurant food may bear a nutrient content claim if the restaurateur has a reasonable basis on which to believe that the food that bears the claim meets the definition for the claim that FDA has established under section 403(r)(2)(A)(i) of the act. Thus, if a restaurateur labels a fish dish as "low fat," on a sign or a placard he or she must have a reasonable basis for believing that the dish complies with FDA's definition for "low fat," that is it contains less than 3 g of fat per 100 g. The reasonable basis can be provided in a number of ways. The restaurateur can show, for example, that FDA's guideline on nutrient levels in seafood (56 FR 60880, Appendix B, November 27, 1991) shows that the fish contains less than 3 g of fat per 100 g, and that the method of cooking and other foods used in the dish would not add fat. In addition, the restaurateur could show that he or she relied on a reliable cookbook that gave values for fat in the finished food that were less than 3 g per 100 g. Certainly other methods are possible. If a restaurateur uses recognized data bases for raw and processed foods to compute nutrient levels in the foods or meals and then does not use methods of preparation that violate the appropriate use of data bases (e.g., uncontrolled addition of ingredients or inappropriate substitutions of ingredients), FDA will

find that there is a reasonable basis for believing that the food meets the criteria for a defined nutrient content claim.

Upon request, the restaurateur will be expected to present the basis on which he or she believes that the pertinent nutrient levels are present in the foods. In addition, the firm must be prepared to demonstrate that it adhered to the information that provides the basis for its belief, i.e., to the recipe, use of certain types and amounts of ingredients, or preparation methods in preparing the food. The agency will then determine whether the basis cited by the restaurant reasonably supports its use of a nutrient content claim such as "low calorie" or "low fat."

This reasonable basis for belief standard for restaurant nutrient content claims will provide regulatory officials, especially State and local authorities, with an effective standard for verifying that such claims are truthful and not misleading and in accordance with FDA regulations. FDA does not have resources to adequately enforce its regulations in restaurants. State and local authorities have traditionally carried out this responsibility. In addition, section 4 of the 1990 amendments provides that State and local authorities may enforce section 403(r) of the act in Federal court.

The agency notes, however, that while restaurants, and particularly small restaurants, have nominally been subject to FDA's existing nutrition labeling regulation (see § 101.10), they have, as a practical matter, not been required to comply with these regulations or with State or local regulations that focused on the nutrient content of the food. Thus, the efforts that will be necessary on the part of restaurants to show that they have a reasonable basis to believe that their food complies with the nutrient content claims requirements will be significant. These efforts will place particularly great demands on the resources of the small business segment of the industry, that is, restaurant firms that have ten or less individual restaurant establishments (Ref. 34). FDA will refer to this segment of the industry as "small restaurants."

Small restaurants generally do not have the established nutrition support component that larger restaurant chains have. Thus, it will be more difficult for small restaurants to determine how to adapt nutrient content information to their individual food selection and preparation methods. In addition, it is likely that they will not be as aware of available information sources, like nutrient content data bases, as large chains. Moreover, because of resource limitations, a small restaurant is not as likely as a large restaurant chain to be familiar with Federal requirements. Thus, small restaurants will have to become familiar with not only FDA's requirements, but with available FDA information, like the nutrient content information that FDA published in conjunction with its regulation on the voluntary labeling of raw fruits and vegetables (56 FR 60880, November 27, 1991).

Because of the great initial demands that small restaurants will find if they wish to make claims, FDA has decided that they should be given additional time to come into compliance with these regulations. Without additional time, for the reasons discussed above, small restaurants will be placed at a disadvantage with respect to their ability to make claims. As a result, they may decide not to even attempt to provide useful nutrition information to consumers about their foods. To provide for equitable implementation of these requirements for small restaurants, FDA has decided to not make § 101.13(q)(5) effective with respect to such establishments until February 14, 1995.

While the statute will be in effect during that period, FDA will not enforce the statute's nutrient content claim requirements in small restaurants until the regulations are effective. Although state action is not preempted under section 403A(a)(5) of the act until Federal regulations are effective, the agency expects that States will refrain from enforcing any nutrient content claim requirements in small restaurants until the Federal regulations are effective for those restaurants.

FDA believes that this action is fully consistent with the 1990 amendments and with the act. The 1990 amendments impose no date by which the agency's regulations must be effective, only when they must be promulgated (see sections 3 and 10 of the 1990 amendments). Moreover, FDA believes that this action will facilitate effective enforcement of the act. FDA believes that the agency's and State's resources can best be used during this initial period in educating small restaurants about the requirements of the law and by developing a better understanding of the unique practical circumstances of small restaurants in complying with nutrient content labeling requirements. Moreover, during this period, there will be an opportunity for interested persons to develop new data bases that will help facilitate the provision of nutrition information on foods sold in restaurants and particularly in small restaurants.

As an additional measure of flexibility, which will especially benefit small restaurants, it was decided not to include claims on menus within the coverage of these regulations. FDA has considerable discretion in regulating nutrient content claims in restaurants. As the comments have indicated, there are unique problems and concerns associated with regulating such claims. The 1990 amendments do not specify precisely how such claims are to be regulated. These regulations will apply to nutrient content claims made in restaurants except on menus. The agency's efforts will focus on signs, placards, and posters, which are increasingly used in fast food and other restaurants to bring nutrition information and claims about food to consumer's particular attention. The comments pointed out that menus are subject to frequent, even daily, change. This additional measure of flexibility for menus will help assure that restaurants, especially small restaurants, will not be deterred by the 1990 amendments from providing useful nutrition-related information to their customers. State's remain free, however, to ensure under their own consumer protection laws that menus do not provide false or misleading information.

Although it has arrived at an approach that will provide for nutrient content claims on restaurant foods, other than the exclusion of menus, FDA does not consider the problem of assuring the useful and reliable provision of nutrient related information in restaurants to be solved. It is possible that there are other definitional criteria that are more appropriate for restaurant foods than those that FDA has developed based largely on packaged foods. Also, it may be that consumers have completely different expectations for, and understanding of, terms used for restaurant foods as compared to the same terms used on packaged foods. If this is the case, a different glossary of terms for use in restaurants may be appropriate. However, at this time, the agency simply does not have the data or knowledge on which to base such determinations. FDA is working, and will continue to work, with the restaurant industry to determine how terms are used on restaurant foods and whether such terms are appropriate. For example, with FDA's cooperation, the National Restaurant Association is planning to undertake a survey of industry use of nutrition information and of consumer knowledge, practices, expectations, and understanding of various terms and symbols in restaurants. FDA is open to petitions for different criteria for nutrient content

claims for restaurant foods, and if data warrant, the agency will consider establishing regulations specifically for restaurant foods.

FDA also recognizes that there are a number of significant issues concerning the adequacy of existing data bases for use to compute nutrient levels in restaurant meals. However, the agency is working, and will continue to work, with the restaurant industry to assess the adequacy of these data bases and to encourage the development of additional or newer data where those data bases are found to be lacking.

In developing more specific policies, FDA will also consider whether restaurant foods should be afforded greater latitude in the compliance criteria than the criteria that are currently applied to nutrient variations in processed foods. FDA regulations state that for naturally occurring vitamins, minerals, and protein, the nutrient content must be at least 80 percent of the value declared, and that for calories, carbohydrate, fat, and sodium, the level must not exceed the declared value by more than 20 percent. The agency recognizes that all data bases have inherent variabilities, and that a computed nutrient level for a food with several ingredients may have an accumulated variability that exceeds the agency's criteria for packaged foods. FDA is concerned about the accuracy of nutrient level estimations, but pending the development of better data, the agency will accept, as a reasonable basis, claims based on nutrient levels drawn from recognized nutrient data bases, without regard to the computed variability or to differences between the computed nutrient levels and levels determined by laboratory analyses. The agency is open to comments and suggestions on how nutrient variability issues should be addressed for restaurant foods and will continue to work with the industry on this issue.

278. One comment stated that the use of the terms "healthy" or "healthful" on meal-type products is necessary for restaurants to assist the consumer in identifying the choices that fit an eating pattern consistent with reducing the risk of certain chronic diseases. This comment further stated that disqualifying levels for fat, saturated fat, sodium, and cholesterol should be set in order to prevent inappropriate foods from bearing this claim.

The agency is publishing a proposed rule concerning use of the term "healthy" as an implied nutrient content claim elsewhere in this issue of the Federal Register. Any comments and information with respect to whether the agency's tentative definition of "healthy" is appropriate for restaurant meals and main dishes will be considered in that rulemaking.

B. Nutrition Labeling of Restaurant Foods

279. Several comments agreed that FDA has authority to require nutrition labeling when nutrient content claims are made on restaurant foods and stated that nutrition labeling should be required on restaurant foods bearing claims. These comments generally contended that restaurants should be required to follow the same nutrition labeling requirements as food manufacturers when nutrient content claims are made.

Many comments expressed the opinion that FDA does not have authority to require nutrition labeling when nutrient content claims are made on restaurant foods and stated that nutrition labeling should not be required on restaurant foods bearing nutrient content claims. These comments generally contended that since the act exempts restaurant foods from nutrition labeling, FDA should allow for the nutrition labeling of restaurant foods on a voluntary basis.

FDA finds nothing in the comments to persuade the agency to adopt a position different from that stated in the general principles proposal (56 FR 60421 at 60427). The agency continues to believe that it has the authority to issue regulations requiring restaurants that make nutrient content claims to adhere to the requirements for such claims, including nutrition labeling.

280. A few comments stated that if nutrition labeling were required for restaurant foods bearing nutrient content claims, restaurants would not make such claims because restaurant foods are not standardized, and it would be too costly to provide accurate nutrition information for these foods. The comments also stated that mandatory nutrition labeling (when a claim is made) would inhibit restaurants from making frequent and more healthful changes in food.

Full nutrition labeling provides the consumer with a way of evaluating a claim within the nutrient context of the food or meal and, therefore, is advantageous in allowing more informed comparisons. However, in the general principles proposal (56 FR 60421 at 60427), the agency recognized the difficulty of providing nutrition labeling for restaurant foods and asked for comment. The comments have persuaded the agency that, at this time, a requirement for full nutrition labeling could be a significant barrier to the transfer of information about favorable nutritional characteristics of restaurant foods. Therefore, FDA is not requiring that full nutrition labeling be provided when a nutrient content claim is made for restaurant foods. It is adopting a somewhat different approach to the provision of nutrient information to the consumer, as explained in the response to the next comment. The agency does, however, encourage the voluntary provision of full nutrient information for restaurant foods, even when claims are not made.

281. Some comments stated that if nutrition labeling were required for restaurant foods bearing a claim, restaurants could utilize available nutrition software programs and recognized databases to provide the necessary information for the nutrition label. One comment stated that FDA should develop educational materials for restaurants that explain their obligation not to make nutrient or health claims without providing nutrition labeling. A few comments stated that before requiring mandatory nutrition labeling of restaurant foods bearing nutrient content claims, a pilot study should be done to determine the cost and feasibility of such labeling, and that more study is needed before the agency requires labeling on restaurant foods.

FDA believes that consumers should have access to information about the nutrient content of restaurant foods for which nutrient content claims or health claims are made. The agency is requiring in new § 101.10 that such information be available upon request by a consumer. However, because FDA recognizes the difficulty of providing nutrition labeling for restaurant foods, at this time it will allow such information to be conveyed either by nutrition labeling as described in new § 101.9 or by the provision of information to the consumer about the level of the nutrient for which the claim is made in a serving of the food upon request by the consumer. Under the latter alternative, for example, if a 333 g meal is characterized as being "low fat," the consumer could be informed that the meal contains less than 10 g of fat. Therefore, under this alternative the restaurateur need not state the actual amount of the nutrient present in a serving of the food but may simply state that the nutrient is present at "less than" or "greater than" the amount that would enable the serving of the food to make the claim. Thus, the agency is not requiring that the firm conduct an analysis of the food in order to provide this information. On the contrary, this information should be readily available to the firm from its determination that the food conforms to the criteria for the

claim. For the interim, the agency will consider that the provision of this limited amount of information to consumers will serve as the functional equivalent of nutrition labeling.

Further, the considerations discussed in the previous section concerning the effective date for small restaurants that make nutrient content claims also apply with respect to nutrition labeling when a nutrient content claim is made in those restaurants. Therefore, FDA is also deferring the effective date of § 101.10 for 1 year for small restaurants.

FDA agrees with the comments that educational programs and further study will be helpful. However, the statutory timeframes imposed on the agency by the 1990 amendments do not afford FDA the luxury of deferring until some future time all rulemaking on restaurant foods. The agency recognizes the limitations in the approach that it is taking and encourages the restaurant industry to continue to work with FDA to devise a program that will provide consumers with truthful and accurate nutrition information, without at the same time inhibiting the flow of such information or the development of healthier foods. The agency points out that the conduct of feasibility and consumer studies is more properly the responsibility of the regulated industry, and that FDA is currently working with the industry to do such studies.

282. One comment stated that § 101.10 should be deleted because it would be outdated if nutrition labeling requirements are imposed for restaurant foods bearing claims.

For the reasons discussed above, FDA is deleting current § 101.10. However, FDA is replacing it with a new provision that sets forth how nutrient information is to be provided when a claim that is subject to section 403(r) of the act is made for restaurant foods. The agency believes that information in § 101.10 was useful in advising firms about alternatives for declaring nutrition information when a claim is made, and as revised, § 101.10 will continue to serve this purpose.

283. Other comments addressed specific issues of nutrition labeling for restaurant foods, such as whether the requirement for nutrition labeling of restaurant foods should apply only to large restaurants with fixed items, and whether the content or format of nutrition labeling should be different for the foodservice industry than for packaged foods.

FDA will address these issues in its further deliberations and in its continued interactions with the regulated industries. The agency is likely to seek comment on a number of these issues in the future.

V. Petitions

In the general principles proposal (56 FR 60421 at 60458), FDA proposed to establish procedural regulations to govern the submission, content, and agency review of the three types of petitions authorized by section 403(r)(4) of the act (i.e., petitions for nutrient content claims, for synonymous terms, and for the use of an implied claim in a brand name). The agency also proposed to redelegate to the Director and Deputy Director of the Center for Food Safety and Applied Nutrition (CFSAN) all of the functions of the Commissioner of Food and Drugs relating to petitions for label claims under section 403(r) of the act involving noncontroversial issues. Further, the agency reiterated its interim policy on petitions submitted pursuant to the 1990 amendments that it announced in a notice published in the Federal Register of March 14, 1991 (56 FR 10906), i.e., that the agency intends to defer or deny action on all such petitions until it establishes the final procedural regulations for the submission, content, and review of these petitions.

284. One comment stated that the 1990 amendments do not require FDA to establish procedural regulations for petitions, and that the agency does not have the authority to defer or deny any petition submitted to the agency on the basis that the agency has not established regulations.

Although the 1990 amendments do not require FDA to establish procedural regulations for the petitions prescribed therein, FDA stated in a notice in the Federal Register of March 14, 1991, (56 FR 10906) that the most efficient way to manage a large influx of petitions likely under the 1990 amendments and to utilize agency resources is for FDA first to establish procedural regulations for handling petitions, and secondly to make them final at the same time as the other substantive regulations implementing the 1990 amendments. The agency continues to believe in the wisdom of this approach. Obviously, it will be more efficient for the agency to be able to simply review petitions to determine whether the petitioner has provided an appropriate basis to justify a claim, than to have to first determine whether a petition has provided the appropriate information and then to review it substantively. FDA believes that adopting new § 101.69 will greatly increase the likelihood that the petitions it receives are adequate.

Also, as explained in the general principles proposal (56 FR 60421 at 60458), the need to promulgate procedural regulations necessitates that the agency defer or deny petitions submitted before such regulations are finalized. Therefore, the agency concludes that the promulgation of procedural regulations for petitions submitted pursuant to the 1990 amendments, and its procedure for handling petitions before the final regulations are established, is appropriate.

285. Another comment urged that FDA not redelegate to the Director and Deputy Director of CFSAN all the functions of the Commissioner of Food and Drugs concerning petitions for label claims under section 403(r) of the act that do not involve controversial issues. The comment stated that all petitions that will be submitted to the agency concerning nutrient content claims and health claims will involve controversial issues that will require a response from the Commissioner of Food and Drugs.

FDA does not agree with this comment. Based on its experience with other types of petitions that have been submitted to FDA for consideration, it is not uncommon for a petition to contain major deficiencies that necessitate the denial of the petition or that result in the petition being put in a "not-filed" status until all deficiencies have been resolved. The agency believes that redelegating such functions to the Director and Deputy Director of CFSAN will permit the agency to take the required actions (e.g., denial of such a petition) in the most resource efficient manner.

Although the agency agrees that many petitions concerning label claims will indeed involve controversial issues, no basis was provided by the comment to support the contention that all such petitions will be controversial, and the agency does not believe that it should make this assumption. If a petition does not involve a controversial issue, the redelegation of the functions provision will enable the agency to take action in the most resource efficient manner. Therefore, the agency is retaining the redelegation provision in this final rule.

286. One comment stated that FDA should include a list of terms and synonyms in the final regulation so that the petition process would not be necessary.

This final rule is not intended to define by regulation all conceivable terms that may be used now or in the future to make nutrient content claims. The 1990 amendments included the petition process to enable FDA to amend the regulations to provide for

new terms and synonyms that may be presented to the agency with appropriate justification. Thus, this final rule does not render the petition process unnecessary.

287. Several comments were concerned that the requirements established for the petition process are ambiguous and should be streamlined. A few other comments suggested that the petition process would impose a significant burden on manufacturers.

The agency has reviewed these comments and has concluded that, in some cases, changes should be made to the requirements to clarify and simplify the petition process and eliminate unnecessary elements. The specific revisions in the final rule are discussed below.

288. One comment suggested that FDA should use the criteria established in section 403(a) and (r) of the act for determining when to deny or grant a petition. This comment also implied that no other requirements are necessary for the agency to use as a basis to determine whether to deny or grant a petition.

The agency does not agree with this comment. While it is true that section 403(a) and (r) of the act are the statutory provisions upon which the proposed procedural regulations are based, these statutory provisions do not provide petitioners with a clear description of the types of information and scientific data that would be necessary for a petition to be acceptable.

Given the large influx of petitions that the agency anticipates receiving, and the statutory time constraints placed on the agency regarding the review of these petitions, it is in the best interest of petitioners and of the agency for FDA to establish procedural regulations that clearly delineate the requirements that petitioners must satisfy when submitting a petition to FDA for consideration. This course will lead to the most efficient use of the petitioner's and the agency's resources because the data requirements for petitions will be clearly stated, and, as stated above, less agency resources will be expended in reviewing deficient petitions.

289. A number of comments expressed concern that the petition process will prevent manufacturers from developing innovative ways to convey nutrient levels in foods, retard product development, and serve as a disincentive for the development of new healthful foods. One comment suggested that the petition process will stifle product innovation because new marketing claims will need agency approval. This same comment also stated that one way to somewhat alleviate this problem would be for the petition that is under review to remain confidential until it is approved by the agency.

As stated above, FDA has in some cases made changes in the final rule to clarify, simplify, and eliminate unnecessary petition requirements. However, the agency's procedures must be consistent with the statutory requirement that all nutrient content claims used on food labels use terms that are defined in the regulations of the Secretary as provided in section 403(r)(2)(A)(i) of the act. Thus, the requirement of agency approval of a claim, and the petition process by which that approval is obtained, derive directly from the act itself.

Furthermore, section 403(r)(4)(A) of the act requires that nutrient content claim petitions that are filed for further action after 100 days and brand name petitions be made available to the public. Because of this requirement in the statute, FDA is retaining the provisions concerning the public availability of these petitions. However, the availability of information in these petitions will be determined in accordance with § 20.61 (21 CFR 20.61). This regulation provides that trade secrets and commercial or financial information that is confidential or privileged are not to be made available for public review.

290. A small number of comments stated that some specific requirements that the agency proposed for nutrient content claim petitions and synonym petitions (e.g., submission of consumer survey data and submission of data to demonstrate that consumers will understand the meaning of the proposed term) should not be included in the petition requirements. Most of these comments regarded the proposed petition requirements as unduly burdensome. Some of the comments stated that the proposed petition requirements command more information than FDA cited in issuing the proposed regulations for nutrient content claims.

FDA has reviewed the proposed requirements and has concluded that it is not necessary (as was proposed under format item B) for descriptor petitions and synonym petitions (proposed § 101.69(m)(1) and (n)(1)) to include data and information to demonstrate that consumers can be expected to understand the meaning of the proposed term under the proposed conditions of use. The agency believes that it can make a rational determination concerning the ability of consumers to understand a term without requiring such data and information, and, therefore, this requirement would impose an unnecessary burden on the petitioner. However, the inclusion of such information in a petition would, if it shows that consumers do correctly understand the term, enhance the persuasiveness of the petition.

The petitioner will still be required to address why the proposed use of the term will not be misleading (format item A). In this regard, if any concerns arise during the agency's review concerning the ability of consumers to understand the meaning of the proposed term, the agency is likely to deny the petition. Therefore, the agency is removing from new § 101.69(m)(1) and (n)(1) the provision stating "The petition shall include data and information, e.g., surveys to the extent necessary, to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use."

291. Some comments that addressed synonym and brand name petition requirements stated that the agency should delete the requirements in proposed format item C (proposed § 101.69(n)(1) and (o)(1)) that the petitioner provide a detailed analysis of the potential effects of the use of a proposed claim on food consumption and any corresponding changes in nutrient intake when requesting approval for a synonym or for a brand name containing an implied nutrient content claim. These comments stated that the burden imposed by this requirement guarantees that no petition will be successfully submitted. They also argued that such requirements treat synonyms as nutrient content claims rather than as alternative terms for claims that have already been approved by the agency.

The agency has considered this comment and agrees that synonym and brand name petitions need not include detailed analyses of food consumption and nutrient intake effects associated with use of the petitioned term. These matters will have been considered by the agency in approving the primary term with which the petitioned term is claimed to be consistent.

The agency is, therefore, deleting proposed format item C from the requirements for synonym and brand name petitions (new § 101.69(n)(1) and (o)(1)) in the final rule.

292. A comment stated that it is not necessary for FDA to publish a Federal Register notice informing the public of the agency's decision on whether to deny or to grant a synonym petition because it is not required by the statute.

FDA continues to believe that publishing a notice announcing the

agency's decision to either grant or deny a synonym petition will provide useful information to the public. Such decisions have relevance to persons interested in the outcome of the agency's review of the petition, because a synonym, if approved, may be used by any firm and, if denied, may not be used on labels or in labeling. Further, such action is appropriate because the granting of a synonym petition is an agency decision that has the force and effect of law. Public notice of the agency's action will notify all potentially affected parties of the legal status of the synonym. FDA is therefore retaining this provision in the final rule.

However, FDA is correcting an error in the proposed codified language. Proposed § 101.69(n)(4) should have stated that FDA will publish a notice in the Federal Register "As soon as practicable following the agency's decision to grant or deny the petition, * * *" as indicated by the preamble discussion. However, the proposed codified text only referred to the "granting" of the petition. FDA is making the appropriate revision in the final rule.

293. One comment stated that the petition process is unnecessary for the use of a nutrient content claim in a brand name if the term has been defined by the agency.

FDA agrees with this comment. In cases where a nutrient content claim has been defined by regulation or provided for under the regulations for implied nutrient content claims in new § 101.65, the term may be used in a brand name in accordance with the provisions of the applicable regulation. However, a brand name petition would be required for the use of a proposed term in a brand name that has not been defined by the agency by regulation or provided for under new § 101.65, but where the petition could establish that the proposed term is consistent with a defined term.

VI. Constitutional Issues

A. The First Amendment

294. A number of comments from trade associations and individual companies argued that truthful nutrient content claims are protected speech under the first amendment. Many comments contended that food labeling, including nutrient content claims, is commercial speech and argued that FDA's proposed regulations do not pass the Supreme Court's test for regulation of commercial speech. Comments asserted that any suggestion that consumers should be screened from truthful information for their own good is the kind of paternalism rejected by the Supreme Court in *Virginia State Board of Pharmacy* v. *Virginia Citizens Consumer Council, Inc.*, 425 U.S. 748, 770 (1976), and that the idea that the public cannot be trusted to make judgments based on truthful information contravenes the basic principles of the first amendment. Comments maintained that the public has an interest in obtaining useful information, and that the Government's interest is best served by allowing the free flow of truthful information. FDA also received a comment expressing the opinion that the proposed rule does not violate the first amendment and urging the agency not to change its position on first amendment grounds.

FDA believes that its nutrient content claim regulations are consistent with the first amendment, and that the act, as amended by the 1990 amendments, does not violate the first amendment. The act has withstood numerous first amendment challenges. See, e.g., *United State* v. *General Nutrition, Inc.*, 638 F. Supp. 556, 562 (W.D.N.Y. 1986); *American Frozen Food Institute* v. *Mathews*, 413 F. Supp. 548, 555 (D.D.C. 1976), aff'd, 555 F.2d 1059 (D.C. Cir. 1977); *United States* v. *Articles of Food * * * Clover Club Potato Chips*, 67 F.R.D. 419, 424 (D. Idaho 1975); *United States v. 8 Cartons, Containing Plantation The Original etc. Molasses*, 103 F. Supp. 626, 628 (W.D.N.Y. 1951).

Parts of the 1990 amendments and these regulations have an incidental effect on speech in a narrowly defined area, food labeling. See *NAACP* v. *Claiborne Hardware* Co., 458 U.S. 886, 912 (1982). The Supreme Court, however, "has recognized the strong governmental interest in certain forms of economic regulation, even though such regulation may have an incidental effect on rights of speech and association." Id. The Government may regulate in areas of economic activity such as securities, antitrust, and labor in ways that affect speech. *SEC* v. *Wall Street Publishing Institute*, 851 F.2d 365, 372-73 (D.C. Cir. 1988), cert. denied, 489 U.S. 1066 (1989); see also *SEC* v. *Suter*, 732 F.2d 1294, 1299 (7th Cir. 1984) (the first amendment does not remove a business engaged in the communication of information from general laws regulating business practices). The Government "does not lose its power to regulate commercial activity deemed harmful to the public whenever speech is a component of the activity." *Ohralik* v. *Ohio State Bar Association*, 436 U.S. 447, 456 (1978); see also *Home Box Office, Inc.* v. *FCC*, 567 F.2d 9, 46 (D.C. Cir.) ("[R]ules restricting speech do not necessarily abridge freedom of speech."), cert. denied, 434 U.S. 829 (1977).

As with securities, labor, and antitrust regulation, the Government exerts extensive regulatory authority over the economic activity surrounding food and its labeling. Yet the regulation of food and food labeling clearly encompasses more than mere economic activity: It protects consumer health and safety in an area where harm to the public can be direct and immediate. See *Ohrali*, 436 U.S. at 456. FDA's crucial role in ensuring that food labels are informative, are not misleading, and do not otherwise misbrand products under the act has long been recognized. See 79 Congressional Record 4734 (1935), reprinted in Dunn, Federal Food, Drug, and Cosmetic Act 280 (1938) (statement of Sen. Copeland) ("No one disputes that the [FDA] should determine the quality of the product; no one disputes that it should determine what is on the label."). In such an area of extensive Federal regulation, the Government may place restrictions on speech by a regulated party where the speech relates directly to the Government's objectives. *SEC* v. *Wall Street Publishing Institute*, 851 F.2d at 372. Indeed, regulation of food labeling would be impossible if the Government could not restrict speech. See id. at 373.

Thus, when FDA seeks to ensure that food is not misbranded, it may place restrictions on label contents. "Freedom of [s]peech does not include the freedom to violate the labeling provisions of the Federal Food, Drug, and Cosmetic Act." *United States* v. *Articles of Food * * * Clover Club Potato Chips*, 67 F.R.D. 419, 424 (D. Idaho 1975). "[C]ertain speech in a certain limited context" becomes part of the labeling of a product and may serve as evidence of a violation of the act. *United States* v. *General Nutrition, Inc.*, 638 F. Supp. 556, 562 (W.D.N.Y. 1986). Thus, the seizure and condemnation of a book that misbrands a product is not a violation of the first amendment, even though in another context the book might be protected. See *United States* v. *8 Cartons, Containing Plantation The Original etc. Molasses*, 103 F. Supp. 626, 628 (W.D.N.Y. 1951); *United States* v. *Articles of Drug*, 32 F.R.D. 32, 35 (S.D. Ill. 1963). "It is the product and the manner in which the product is marketed which is said to be illegal," rather than the speech itself. *General Nutrition*, 638 F. Supp. at 562. A prohibition on selling a misbranded product restrains the violative act of selling, not speech itself. *Kellogg Co.* v. *Mattox*, 763 F. Supp. 1369, 1381 (N.D. Tex. 1991) (construing Texas food and drug law), aff'd without opinion, 940

F.2d 1530 (5th Cir. 1991). "The substantial government interest in the goals of the Act justif[ies] this extremely narrow encroachment" on speech. *General Nutrition*, 638 F. Supp. at 562. Indeed, where certain claims misbrand a product, "[a] requirement that the claims be removed, in order to sell the product, is certainly less restrictive than a flat prohibition of the sale of the product." *Kellogg*, 763 F. Supp. at 1381.

With the provisions of the 1990 amendments that govern nutrient content claims, Congress sought to put an end to the proliferation of confusing and contradictory nutrient content claims. 136 Congressional Record S16610 (Oct. 24, 1990) (statement of Sen. Hatch); 136 Congressional Record H5840 (July 30, 1990) (statement of Rep. Waxman). In order to assist consumers in improving their eating habits, Congress devised a scheme to ensure that nutrient content claims in food labeling will help consumers to make good nutrition choices, not mislead them. 136 Congressional Record H12954 (Oct. 26, 1990) (statement of Rep. Moakley); 136 Congressional Record S16609 (Oct. 24, 1990) (statement of Sen. Mitchell). Under this scheme, only those claims that FDA has defined by regulation, see section 343(r)(2)(A)(i) of the act, or approved pursuant to a petition, see section 343(r)(4)(A), are permitted, and a food that bears an unapproved nutrient content claim is misbranded. Since FDA case law makes clear that a label statement that misbrands a food product is not subject to first amendment protection, an unapproved nutrient content claim on a food label would not be protected speech. See *United States* v. *General Nutrition, Inc.*, 638 F. Supp. 556, 562 (W.D.N.Y. 1986); *United States* v. *Articles of Food * * * Clover Club Potato Chips*, 67 F.R.D. 419, 424 (D. Idaho 1975); *United States* v. *8 Cartons, Containing Plantation The Original etc. Molasses*, 103 F. Supp. 626, 628 (W.D.N.Y. 1951); *United States* v. *Articles of Drug*, 32 F.R.D. 32, 35 (S.D. Ill. 1963).

Congress considered existing labeling practices to be harmful to the public because of the "confusing" and "misleading" nutrient content claims made by many manufacturers. 136 Congressional Record H12954 (Oct. 26, 1990) (statement of Rep. Moakley); see also 136 Congressional Record H5843 (July 30, 1990) (statement of Rep. Madigan); cf. *Ohralik*, 436 U.S. at 456 ("[T]he State does not lose its power to regulate commercial activity deemed harmful to the public whenever speech is a component of that activity."). Congress dealt with this problem by crafting a system to permit certain useful information to appear on the food label, while ensuring that the information is not misleading. 136 Congressional Record H12954 (Oct. 26, 1990) (statement of Rep. Moakley); 136 Congressional Record S16609 (Oct. 24, 1990) (statement of Sen. Mitchell). Congress considered these restrictions on speech necessary to further the government's interest in ensuring that nutrient content claims on food labeling would not mislead consumers. The government's action in regulating the food label does not offend the first amendment simply because speech is involved. *Ohralik*, 436 U.S. at 456. The case law establishes that FDA's power to regulate the food label derives from its broad regulatory powers over food, and these regulations are valid under the limited scrutiny that has been afforded restrictions on speech under extensive regulatory schemes involving areas of economic activity. See *SEC* v. *Wall Street Publishing Institute*, 851 F.2d at 372–73; see also *Dun & Bradstreet, Inc.* v. *Greenmoss Builders*, 472 U.S. 749, 758 n.5 (1985); *Ohralik* v. *Ohio State Bar Association*, 436 U.S. 447, 456 (1978).

295. Many comments argued that labeling is commercial speech, and that restrictions placed on it must pass the tests enunciated by the Supreme Court in cases involving commercial speech. Unlike "advertising pure and simple," *Zauderer* v. *Office of Disciplinary Counsel*, 471 U.S. 626, 637 (1985), labeling does not fall clearly within the bounds of commercial speech. The agency does not consider it necessary for first amendment analysis, however, to determine whether or not food labeling fits the definition of commercial speech. See *SEC* v. *Wall Street Publishing Institute*, 851 F.2d at 372. Rather, the agency considers labeling on foods to form "a distinct category of communications in which the Government's power to regulate is at least as broad as with respect to the general rubric of commercial speech." *SEC* v. *Wall Street Publishing Institute*, 851 F.2d at 373. Nonetheless, recognizing that at least one court has categorized labeling as commercial speech, General Nutrition, 638 F. Supp. at 562, FDA agrees that labeling should certainly be considered closer to commercial speech than to "pure" speech.

Even if labeling is analyzed as commercial speech, these regulations do not violate the first amendment. First, speech that is misleading is not protected and may be prohibited. *Central Hudson Gas & Electric Corp.* v. *Public Service Commission*, 447 U.S. 557, 563–564 (1980). Secondly, speech that is only potentially misleading may be restricted, so long as the restrictions directly advance a substantial governmental interest and are no more extensive than necessary to serve that interest. *Central Hudson*, 447 U.S. at 566. These regulations govern a kind of speech that is inherently misleading and that, in Congress' judgment, has been used to mislead the American public for years: Unregulated, nonstandardized nutrient content claims on the food label. However, even if such claims are considered only potentially misleading, the regulations pass the test enunciated in *Central Hudson*.

Commercial speech receives only limited protection under the first amendment. See, e.g., *Bolger* v. *Youngs Drug Products Corp.*, 463 U.S. 60, 64–65 (1983). For commercial speech to be protected, it must concern lawful activity and not be misleading. *Central Hudson*, 447 U.S. at 563–64. The Supreme Court has recognized that restrictions on commercial speech may be appropriate to prevent deception. *Virginia State Board of Pharmacy* v. *Virginia Citizens Consumer Council*, 425 U.S. 748, 771 n.24 (1976). These regulations will have the effect of ensuring that the nutrition claims that appear in food labeling are not misleading. See *American Frozen Food Institute* v. *Mathews*, 413 F. Supp. 548, 555 (D.D.C. 1976), aff'd, 555 F.2d 1059 (D.C. Cir. 1977) (because FDA regulation was based on the agency's conclusion that "labeling which fails to meet the requirements of the regulation is misleading or otherwise not in compliance with the act," the regulation did not violate the first amendment).

The Supreme Court has labeled as misleading—and thus not protected—both speech that is inherently likely to deceive and that which "experience has proved * * * is subject to abuse." In re *R.M.J.*, 455 U.S. 191, 203 (1982). For example, in *Friedman* v. *Rogers*, 440 U.S. 1, 14–15 (1979), the Court held that Texas could prohibit the use of trade names by optometrists where there was a history of deception and abuse of the public. See also *Ohralik* v. *Ohio State Bar Association*, 436 U.S. 447, 468 (1978) (upholding State bar's rules against in-person solicitation where there was an inherent potential for abuse and prophylactic regulation was needed).

By enacting the 1990 amendments, Congress sought to ensure that food labeling, including express and implied nutrient content claims, would be accurate, uniform, and "based on science." 136 Congressional Record S16610 (Oct. 24, 1990) (statement of

Sen. Hatch). With respect to nutrient content claims, the principal problem that Congress sought to correct was the use of ambiguous, undefined claims like "light" and "low." See, e.g., 136 Congressional Record H5840 (July 30, 1990) (statement of Rep. Waxman). Experience had shown that consumers were being misled because these terms were being used differently by different manufacturers. Id.; 136 Congressional Record H12, 953–954 (Oct. 26, 1990) (statement of Rep. Madigan). Congress recognized that consumers were being hampered in their attempts to achieve a healthy diet by confusing implied nutrient content claims like "light." 136 Congressional Record H12954 (Oct. 26, 1990) (statement of Rep. Moakley).

Because of the misleading character of unregulated, nonstandardized nutrient content claims, Congress legislated that any claim that is not consistent with FDA regulations misbrands a food. Section 403(r)(2)(A)(i) of the act states that a food is misbranded if its label or labeling contains a claim that "expressly or by implication * * * characterizes the level of any nutrient * * * of the food *unless* the claim" complies with regulations promulgated by FDA (emphasis added). Section 403(r)(1)(A) of the act. By taking this approach, Congress chose to permit only those nutrient content claims that FDA defines or approves, effectively recognizing that unregulated claims mislead the public.

Particular attributes of unregulated nutrition claims on the food label make them inherently misleading. Because nutrition claims are of great importance to the public, they have a greater potential to be deceptive: Representations relating a product to an issue of public concern as a means to induce purchases may take on exaggerated importance in the public mind and thus be more likely to mislead. *FTC* v. *Pharmtech Research, Inc.*, 576 F. Supp. 294, 301 (D.D.C. 1983) (advertisements for food supplement were misleading where they "played on the average consumer's well-founded fear of cancer"). In addition, nutrient content claims on food labeling are difficult for consumers to verify independently. See *American Home Products* v. *FTC*, 695 F.2d 681, 698 (3d Cir. 1982); cf. *Peel* v. *Attorney Reg. & Disciplinary Commission*, 496 U.S. 91, 110 S. Ct. 2281, 2288 (1990) (a lawyer's certification is a "verifiable fact"). Finally, consumers place great reliance on the portions of the food label that they believe to be regulated by the Government. FDA's 1990 Health and Diet Survey, Division of Consumer Studies, CFSAN. Unapproved nutrient content claims that consumers assume to be consistent with government regulations are therefore more likely to be misleading. "Pervasive Government regulation * * * and consumer expectations about such regulation, create a climate in which questionable claims * * * have all the more power to mislead." *American Home Products* v. *FTC*, 695 F.2d at 697.

296. Many comments argued that nutrient content claims are only potentially misleading, pointing out that the Government may not absolutely prohibit potentially misleading speech if it can also be presented in a nondeceptive way. *Peel* v. *Attorney Registration & Disciplinary Comm'n*, 110 S. Ct. 2281, 2287 (1990); In re R.M.J., 455 U.S. 191, 203 (1982). The preferred remedy for potentially misleading speech, these comments stress, is not a prohibition but a requirement of disclaimers or explanation. In re *R.M.J.*, 455 U.S. at 203 (citing *Bates* v. *State Bar of Arizona*, 433 U.S. 350, 375 (1977)); see also *Peel*, 110 S. Ct. at 2292 (referring to "[t]he presumption favoring disclosure over concealment"). Comments argued that given the constitutionally based preference for more speech, rather than less, FDA should require disclaimers or explanations rather than prohibiting unapproved claims.

Even if unregulated nutrition claims are considered only potentially misleading, rather than actually or inherently misleading, these regulations are constitutional. The government may place restrictions on commercial speech that is merely potentially misleading. Such restrictions must directly advance a substantial governmental interest and be no more extensive than necessary to serve that interest. *Central Hudson Gas & Electric Corp.* v. *Public Service Commission*, 447 U.S. 557, 566 (1980). These regulations pass that test.

First, the government's interest is clearly substantial. The 1990 amendments and these regulations seek to ensure that consumers have access to nutrition information that is truthful, reliable, understandable, scientifically valid, and not misleading. This information will enable consumers to make more healthful food choices. The Supreme Court has recognized "the health, safety, and welfare of * * * citizens" as a substantial government interest. *Posadas de Puerto Rico Associates* v. *Tourism Co.*, 478 U.S. 328, 341 (1986). Moreover, consumers have a first amendment interest in obtaining information on which to base a decision whether to buy a product, and this interest is "served by insuring that the information is not false or deceptive." *National Commission on Egg Nutrition* v. *FTC*, 570 F.2d 157, 162 (7th Cir. 1977), cert. denied, 439 U.S. 821 (1978) "The fact that health is involved enhances the interests of both consumers and the public in being assured 'that the stream of commercial information flow[s] cleanly as well as freely.'" Id. (quoting *Virginia State Board of Pharmacy*, 425 U.S. at 772); *American Home Products*, 695 F.2d 681, 714. Moreover, FDA is implementing legislation whose purpose is "essential if the consumer is to obtain reasonable information regarding * * * the foods he buys." *American Frozen Food Institute* v. *Mathews*, 413 F. Supp. 548, 553 (D.D.C. 1976), aff'd, 555 F.2d 1059 (D.C. Cir. 1977).

Secondly, the regulations directly advance the government interest. Under the 1990 amendments and these regulations, FDA will define a nutrient content claim by regulation or make an administrative determination that a suggested claim is synonymous with a previously defined claim before permitting the claim to be used. In this way, the regulations will ensure that such claims are consistent, understandable, and do not confuse or mislead consumers. The regulatory scheme will also encourage companies to provide consumers with information that will enable them to improve their diets. There is an "immediate connection," *Central Hudson*, 447 U.S. at 569, between nutrient content claims on food labels and consumers' food choices.

Finally, these regulations are no more extensive than necessary to serve the Government's interest. Under *Board of Trustees* v. *Fox*, regulations that are narrowly tailored to serve the Government's interest will meet this prong of the *Central Hudson* test. 109 S. Ct. 3028, 3032–35 (1989). Narrow tailoring requires a reasonable fit between regulatory ends and means: "Not necessarily the single best disposition but one whose scope is 'in proportion to the interest served.'" Id. at 3035; see also *Ward* v. *Rock Against Racism*, 109 S. Ct. 2746, 2758 (1989) (a regulation is narrowly tailored if Government interest would be achieved less effectively without the regulation). These regulations reasonably and effectively ensure that nutrient content claims on food labels will be informative, consistent, and not misleading. Thus, they meet the third prong of the *Central Hudson* test and do not violate the first amendment.

FDA recognizes that the Government may not absolutely prohibit potentially misleading information if the information can also be presented in a

nondeceptive way. See In re *R.M.J.*, 455 U.S. 191, 203 (1982). The agency further acknowledges that the preferred remedy for potentially misleading speech is a disclaimer or explanation rather than a prohibition. Consequently, these regulations impose only those restrictions that are necessary to ensure that nutrient content claims are presented in a nondeceptive way. Conceding for the sake of argument that some unapproved claims are only potentially misleading, FDA has not outlawed the information conveyed by such claims; instead, the agency has prescribed that the information be presented in standardized form, using uniform, terms defined by the agency, so that consumers will not be misled.

297. Some comments argued that nutrient content claims, which help consumers to achieve healthy eating habits, convey information of general interest about nutrition and health. Thus, the comments argued, nutrient content claims are "pure" speech, not commercial speech, and as such are entitled to full first amendment protection.

FDA disagrees with these comments. As discussed above, FDA believes nutrient content claims belong to a distinct category of communications in which the government's power to regulate is broad. Under the comprehensive Federal scheme for the regulation of food and drugs, the Government has authority to impose incidental restrictions on food labeling, including nutrient content claims. As between commercial speech and "pure" speech, however, FDA believes nutrient content claims should be categorized as commercial speech. Labeling statements on food products intended for sale would clearly appear in the context of a commercial transaction and would "propose" such a transaction. See *Bolger* v. *Youngs Drug Products*, 463 U.S. 60, 66, 103 S. Ct. 2875, 2880 (1983); *Central Hudson Gas* v. *Public Service Commission*, 447 U.S. 557, 562 n.5, 100 S. Ct. 2343, 2349 n.5 (1980). A label is not entitled to the protection due noncommercial speech simply because it relates to an issue of broad public interest. See *Board of Trustees* v. *Fox*, 109 S. Ct. 3028, 3032 (1989); *Bolger*, 463 U.S. at 68, 103 S. Ct. at 2881; *Central Hudson*, 447 U.S. at 562 n.5, 100 S. Ct. at 2349 n.5. In determining whether the statements on a label are pure speech, it is irrelevant that they might be considered protected in other contexts. See *Zauderer* v. *Office of Disciplinary Counsel*, 471 U.S. 626, 637 n.7, 105 S. Ct. 2265, 2274 n.7 (1985). Just as informational pamphlets were considered commercial speech in *Bolger*, so too nutrient content claims on food labels, as between pure speech and commercial speech, should be considered commercial speech. See *Bolger*, 463 U.S. at 66–68, 103 S. Ct. at 288–81.

298. Several comments argued that the requirement that nutrient content claims be approved by FDA before they may be used places an unconstitutional prior restraint on expression. The agency, the comments reasoned, would be banning speech not previously determined to be false or misleading. The speech would remain banned until the agency defined the term at issue. Some comments further complained that the petition process is too burdensome. Citing *Space Age Products* v. *Gilliam*, 488 F. Supp. 775 (D. Del. 1980), one comment argued that "the public has an interest in minimizing the frequency and duration of erroneously imposed prior restraints on commercial speech." Id. at 784. This interest, according to *Gilliam*, mandates narrow tailoring of prior restraints on commercial speech and "such traditional safeguards with respect to these restraints as are not inconsistent with its ability to achieve its important and legitimate objectives." Id.

The Supreme Court has said that because commercial speech is not easily chilled, the heavy presumption against prior restraints may not apply to commercial speech. *Virginia State Board of Pharmacy*, 425 U.S. at 772 n.24. The Court has repeated its position on this subject since *Space Age Products* was decided. In Central Hudson, the Court remarked that the State could have required that ads for electricity be approved by the state before being used and reiterated that traditional prior restraint doctrine may not apply to commercial speech. *Central Hudson*, 447 U.S. at 571 n. 13.

Even assuming for the sake of argument that the presumption against prior restraints does apply to commercial expression, the agency believes that its regulations are constitutional because, as discussed more fully above, they limit only speech Congress has already determined to be misleading. This speech is therefore unprotected. See *American Frozen Food Institute v. Mathews*, 413 F. Supp. 548, 555 (D.D.C. 1976), aff'd, 555 F.2d 1059 (D.C. Cir. 1977) (FDA regulation based on agency's conclusion that labeling that fails to meet the requirements of the regulation is misleading or otherwise not in compliance with the act was not unconstitutional prior restraint). In addition, the regulatory scheme incorporates procedural safeguards that provide for a prompt determination of whether a particular claim is permissible. The agency is required to act on nutrient content claim petitions expeditiously. See section 403(r)(4)(A) of the act.

299. Some comments argued that the requirement that the proponent of an undefined claim submit a petition for its approval unconstitutionally shifts the burden of distinguishing misleading and nonmisleading speech from the Government to the speaker. See *Zauderer* v. *Office of Disciplinary Counsel*, 471 U.S. 626, 646 (1985). Even a showing that the speech has the potential to mislead does not allow the Government to shift that burden, one comment contended, citing *Peel* v. *Attorney Registration & Disciplinary Comm'n*, 110 S. Ct. 2281, 2292 (1990).

As discussed above, the Government has met its burden of showing that the speech being restricted is misleading. Congress made specific findings that both nutrient content claims in general and particular terms, such as "light," have misled the public. See, e.g., 136 Congressional Record H5840 (July 30, 1990) (statement of Rep. Waxman); id. at H5843 (statement of Rep. Cooper); 136 Cong. Rec. S16609 (Oct. 24, 1990) (statement of Sen. DeConcini). In addition, the comment misconstrues *Peel*: In that case, the Supreme Court said that a mere potential to mislead did not justify prohibition of the speech at issue. The Court did not say that the Government could not, based on a showing that a particular kind of speech had the potential to mislead the public, require preapproval of the speech.

300. Some comments suggested that the nutrient content claims regulations are unconstitutionally overbroad because, according to the comments, they reach a substantial amount of protected speech.

FDA disagrees. As discussed in detail elsewhere in this document, these regulations are narrowly tailored to meet a substantial government interest and do not "sweep[] within [their] prohibitions what may not be punished under the First * * * Amendment[]." *Grayned* v. *City of Rockford*, 408 U.S. 104, 115 (1972). In any event, it is doubtful that the overbreadth doctrine would apply to these regulations, particularly if they were considered to regulate commercial speech, because the overbreadth doctrine does not apply to commercial speech. *Village of Hoffman Estates* v. *Flipside, Hoffman Estates, Inc.*, 455 U.S. 489, 497 (1982); *Central Hudson*, 447 U.S. at 565 n.8.

301. One comment cited several lower court decisions involving food labeling and the first amendment to support its argument that these regulations are

unconstitutional. *Lever Bros.* v. *Maurer*, 712 F. Supp. 645 (S.D. Ohio 1989); *Taylor Wine Co.* v. *Department of the Treasury*, 509 F. Supp. 792 (D.D.C. 1981); *American Meat Inst.* v. *Ball*, 424 F. Supp. 758 (W.D. Mich. 1976); *Anderson, Clayton & Co.* v. *Washington State Dep't of Agric.*, 402 F. Supp. 1253 (W.D. Wash. 1975).

FDA disagrees with the comment's interpretation of these cases. *Anderson*, which predated *Virginia Pharmacy* and the Supreme Court's other commercial speech cases, struck down a State law prohibiting use of dairy terms in the advertising of margarine. The court mistakenly applied strict scrutiny to the statute, holding that the State must show a *compelling* government interest to justify restrictions on speech. 402 F. Supp. at 1257 (emphasis added). As discussed above, under current Supreme Court jurisprudence the Government need only demonstrate a substantial interest in regulating potentially misleading speech. *Central Hudson*, 447 U.S. at 564. If the speech is actually or inherently misleading, it may be prohibited or restricted on that basis alone. See *Peel*, 110 S. Ct. at 2292–93; In re *R.M.J.*, 455 U.S. at 203.

In *Lever Bros.* v. *Maurer*, which involved a similar statute prohibiting the use of "butter" in advertising for products intended as imitations of or substitutes for butter, the court held that prohibition of the term "butter" without regard for whether the term was used in a misleading way violated the first amendment. 712 F. Supp. at 652–653. Here, Congress has already found the labeling practices at issue to be misleading. In addition, here the Government's interest is not merely in accuracy, but also in uniformity. Standardizing the nutrition information that appears in food labeling, including nutrient content claims, will make it easier for consumers to find, understand, and compare the information they need to make healthy eating choices. No such government interest was present in *Lever Bros.*

Taylor Wine is also inapposite. That case involved a regulatory scheme that required preapproval of wine labeling. The challenge was not to the preapproval requirement itself, as here, but to the agency's refusal to approve a claim that it had conceded would not confuse or mislead consumers of the plaintiffs' wines. 509 F. Supp. at 795. In addition, the agency had conceded that the claim, which used the term "light," met the requirements established by the agency for use of that term. Id. at 793. Under the regulatory scheme at issue here, FDA will allow use of terms defined by FDA in nutrient content claims without preapproval.

Finally, in *American Meat Institute*, there was no first amendment challenge to the legislation at issue; rather, the first amendment was used to uphold the legislation against a preemption argument. The challenged legislation required meat producers whose products did not meet Michigan standards to notify Michigan consumers of that fact. The court upheld the law in part on the basis of the consumers' first amendment right to receive information. 424 F. Supp. at 769. The court further found that the State had a strong interest in consumer education and protection and suggested that striking down the statute might limit the State's communications with its citizens in violation of the first amendment. Id. at 767. The court said that the first amendment question that would arise if the Michigan law were preempted provided additional support for its holding that the notices required by the State were not "labeling" as defined in the Federal Wholesome Meat Act (21 U.S.C. 678). Id. at 769. Thus, far from serving to undermine the nutrient content claim regulations, *American Meat Institute*, if anything, supports them, since it recognizes consumers' strong interest in receiving accurate, useful information about food and the government's strong interest in ensuring that such information will be provided.

302. A number of comments argued that the rule prohibits certain nonmisleading uses of particular terms ("fresh" or "light") and types of claims (comparative statements or amount statements), and that such nonmisleading uses cannot constitutionally be prohibited.

FDA disagrees with the premise of these comments. As explained more fully above, Congress found that the unregulated use of undefined nutrient content claims is inherently and actually misleading. This final rule allows use of the referenced terms and types of claims, but only in ways that will inform the public rather than mislead it. The agency's response to the comments' suggestions concerning particular terms and types of claims can be found elsewhere in this document.

303. Two comments contended that with respect to certain types of nutrient content claims, FDA should use its authority under section 403(a)(1) of the act to regulate false and misleading claims on a case-by-case basis, rather than issuing regulations under the 1990 amendments. Specifically, the comments argued that statements of the amount or percentage of nutrients in foods (e.g., "contains 160 mg sodium") and certain ingredient claims that FDA has classified as implied nutrient content claims (e.g., "high in oat bran") should be regulated under section 403(a)(1) of the act rather than under the 1990 amendments.

FDA disagrees. Congress enacted the 1990 amendments because it found that existing law was insufficient to protect consumers from misleading food labeling practices. While FDA could have regulated deceptive nutrient content claims, including ingredient and amount claims, under section 403(a)(1) of the act, Congress considered FDA's authority to do so unclear and in need of strengthening. H. Rept. 101–538, 101st Cong., 2d sess. 7 (1990). Consequently, Congress passed new legislation directing FDA to issue new regulations that would curb deceptive food labeling. Congress specifically authorized FDA to issue regulations governing amount claims, see section 3(b)(1)(A)(iv) of the 1990 amendments, and also provided more generally for the issuance of regulations limiting the use of claims that expressly or by implication characterize the level of a nutrient required to be on the food label. See section 403(r)(1)(A) of the act. A claim that a food contains an ingredient associated with a particular nutrient by implication characterizes the level of that nutrient.

It is entirely appropriate for FDA to regulate ingredient and amount claims under the new regulations, which specifically target these claims, rather than under section 403(a)(1) of the act; indeed, FDA had no choice but to do so, given the congressional mandate. Moreover, the regulations themselves are narrowly tailored and do not prohibit nondeceptive speech.

304. Some comments asserted that FDA should not prohibit the use of undefined terms and should allow synonyms of FDA-defined terms as long as the synonyms meet the standard for the defined term.

Section 403(r)(2)(A)(i) of the act states that nutrient content claims may be made only if the characterization of the level made in the claim uses terms which are defined in regulations by the Secretary (and FDA, by delegation). This rule also applies to synonyms. See section 3(b)(1)(A) of the 1990 amendments. As discussed above, Congress was concerned about the proliferation of confusing and conflicting nutrient content claims; hence, it sought uniformity on the food label. Allowing unapproved terms and synonyms would undermine that goal. The petition process provided for in new § 101.69 allows anyone who wishes to suggest both new terms and

synonyms of already-defined terms. In light of Congress' findings and the availability of the petition process to expand the vocabulary of nutrient content claims, FDA does not believe its regulations unduly burden expression.

305. One comment proposed that FDA permit the use of unapproved nutrient content claims if they are consistent with and explained by an immediately adjacent term that is defined by regulation. The comment argued that this solution would cure the first amendment infirmity caused by the prohibition of unapproved claims yet would fulfill the goals of the 1990 amendments.

The agency rejects this suggestion because it would lead to the same kind of inconsistent use of terms that Congress wanted to eradicate. For example, one company might use "lean" as a synonym for "light," while another might use it as a synonym for "low fat." Thus, "lean" would be used in contradictory ways on different products. Such a result is not permissible under the act. As discussed above, the agency does not believe that its approach is constitutionally infirm.

306. In response to FDA's request for comments as to whether it should define "natural" or ban such claims entirely on the ground that they are false or misleading, one company argued that prohibition of "natural" would be an unconstitutional restriction on free speech. FDA has decided not to define the term "natural" or to prohibit its use. Therefore, this comment is moot.

307. One comment asserted that because those who violate the act are subject to criminal prosecution, FDA must define clearly which nutrient content claims are allowable. The comment further argued that a manufacturer who uses a term not intended as a nutrient content claim may learn, too late, that FDA so interprets it as such.

The comment seems to be invoking the vagueness doctrine, which, in the first amendment context, is generally applied to strike down prohibitions on speech that leave individuals without clear guidance on the type of speech that is prohibited. See, e.g., *Village of Hoffman Estates* v. *Flipside, Hoffman Estates, Inc.*, 455 U.S. 489, 498—99 (1982); *Grayned* v. *City of Rockford*, 408 U.S. 104, 108 (1972). That is not the case here. Only approved nutrient content claims will be permitted on the food label, and all other nutrient content claims will misbrand a food. It should thus be clear which type of speech is prohibited and which permitted. Manufacturers will be on notice that the use of an unapproved nutrient content claim is prohibited conduct.

As to the comment's second point, FDA agrees that it is important to consider intent when determining whether an implied nutrient content claim has been made. However, the agency notes that intent means more than the manufacturer's subjective intent. "FDA is not bound by the manufacturer's subjective claims of intent * * *." *National Nutritional Foods Ass'n* v. *Mathews*, 557 F.2d 325, 334 (2d Cir. 1977). An article's intended use is established by its labeling, promotional material, advertising, and "any other relevant source." Id.; *United States* v. *An Article * * * Consisting of 216 Individually Cartoned Bottles * * * "Sudden Change,"* 409 F.2d 734, 739 (2d Cir. 1969). If a phrase on a food label meets the definition of an implied nutrient content claim, it is such a claim regardless of the manufacturer's subjective intent. The definition of an implied nutrient content claim is clear from the statute as interpreted by the regulations. See section 403(r)(1)(A) of the act; new § 101.13(b). Manufacturers are required to keep abreast of changes in the law and are responsible for scrutinizing their labeling to determine whether it makes nutrient content claims.

B. The Fifth Amendment

These regulations will affect some companies' use of brand names, including names subject to trademarks. A brand name that includes an FDA-defined nutrient content claim, such as "light," will be permitted to appear only on products that meet the regulations' definition of "light." Brand names that include nutrient content claims that FDA has not defined will not be permitted unless they were in use before October 25, 1989, the date the 1990 amendments were reported out of committee, or unless a petition for their use is submitted and approved.

308. Some comments contended that outlawing a brand name could violate the fifth amendment. Because brand names are property, banning their use could constitute a taking without just compensation, these comments argued. The comments suggested that in keeping with Executive Order No. 12630, FDA should conduct a takings analysis to assess whether compensation to owners of affected brand names would be appropriate.

In its November 27, 1991, regulatory impact analysis (RIA), 56 FR 60856 at 60865, FDA stated that any alteration of trade names required by the new regulations would not constitute a taking, and that, as a result, no takings analysis was necessary. In view of the comments and concerns raised about the takings issue, however, the agency reconsidered and decided that it was appropriate to conduct a formal takings analysis pursuant to Executive Order No. 12630. The agency has completed the takings analysis and still believes that there is no regulatory taking under the fifth amendment if a manufacturer is required to alter its brand name when that brand name asserts, expressly or by implication, a nutrient content claim that has not been approved by FDA. The basis for this conclusion is set forth in response to the comment that follows.

309. Comments from industry argued that the regulations' effect on companies' ability to use brand names constitutes a taking without compensation in violation of the fifth amendment of the U.S. Constitution. They point foremost to the financial consequences of losing the use of a valuable brand name. Standing alone, however, diminution in property value does not establish a taking. *Penn Central Transp. Co.* v. *City of New York*, 438 U.S. 104, 131 (1978). Indeed, "[g]overnment hardly could go on if to some extent values incident to property could not be diminished without paying for every such change in the general law." *Pennsylvania Coal Co.* v. *Mahon*, 260 U.S. 393, 413 (1922).

The Supreme Court has identified three factors for courts to consider in assessing whether a regulatory taking has occurred: (1) The character of the governmental action; (2) the extent to which a regulation interferes with reasonable investment-backed expectations; and (3) the regulation's economic impact. *Ruckelshaus* v. *Monsanto Co.*, 467 U.S. 986, 1005 (1984); *Penn Central*, 438 U.S. at 124. When examined in light of these three factors, it is clear that FDA's regulations do not effect a taking in violation of the Constitution.

With respect to the first factor, courts are more likely to find a taking when the interference with property can be characterized as a physical invasion by the Government than when the interference is caused by a regulatory program that "adjust[s] the benefits and burdens of economic life to promote the common good." *Penn Central*, 438 U.S. at 124. Courts have accorded particular deference to governmental action taken in order to protect the public interest in health, safety, and welfare. See *Keystone Bituminous Coal Ass'n* v. *DeBenedictis*, 480 U.S. 470, 488 (1987); *Penn Central*, 438 U.S. at 125; *Atlas Corp.* v. *United States*, 895 F.2d 745, 757 (Fed. Cir.), cert. denied, 111 S. Ct. 46 (1990);

Calvert Invs. v. *Metro. Sewer Dist.*, 847 F.2d 304, 309 (6th Cir. 1988).

With the 1990 amendments and these regulations, Congress and FDA seek to protect the public interest in health by ensuring that consumers who wish to maintain healthy dietary practices may be assisted in doing so by the information on food labels. This action constitutes a reasonable effort by the Government to promote the common good. By defining nutrient content claims, the regulations will "bring a sense of order to the understanding of terms used when describing characterizations of food products." 136 Congressional Record S16610 (Oct. 24, 1990) (statement of Sen. Hatch). By permitting approved nutrient content claims, the regulations seek to provide useful information to consumers while ensuring that the information is not confusing or misleading. 136 Congressional Record H12954 (Oct. 26, 1990) (statement of Rep. Moakley). These regulations substantially advance and are rationally related to FDA's legitimate interest in promoting the public health through the food label. See *Keystone*, 480 U.S. at 485; *Monsanto*, 467 U.S. at 1007; see also *Pace Resources, Inc.* v. *Shrewsbury Township*, 808 F.2d 1023, 1030 (3d Cir.) ("[T]he governmental action is entitled to a presumption that it does advance the public interest."), cert. denied, 482 U.S. 906 (1987).

Although these regulations will restrict the use of certain defined terms, including terms that appear in some trade names, this restriction does not rise to the level of a taking. Governmental restrictions on the uses individuals can make of their property are "properly treated as part of the burden of common citizenship." *Keystone*, 480 U.S. at 491 (citation omitted). These burdens are "borne to secure 'the advantage of living and doing business in a civilized community.'" *Andrus* v. *Allard*, 444 U.S. 51, 67 (1979) (quoting *Pennsylvania Coal Co.* v. *Mahon*, 260 U.S. 393, 422 (1922) (Brandeis, J., dissenting)). Moreover, these regulations are not without benefit to manufacturers. See *Keystone*, 480 U.S. at 492 ("While each of us is burdened somewhat by such restrictions, we, in turn, benefit greatly from the restrictions that are placed on others."); see also *Penn Central*, 438 U.S. at 134 ("preservation of landmarks benefits all * * * citizens and all structures"). By defining certain terms, the regulations will increase the reliability of the food label and thus will bolster consumer confidence in label statements. They will also level the commercial playing field: No manufacturer will be able to use a defined term unless its use is consistent with the definition.

The second factor that courts consider is whether a company has a reasonable investment-backed expectation in continuing to use its brand name. To be reasonable, expectations must take into account the power of the State to regulate in the public interest. *Pace Resources*, 808 F.2d at 1033. Reasonable expectations must also take into account the regulatory environment, including the foreseeability of changes in the regulatory scheme. "In an industry that long has been the focus of great public concern and significant government regulation," *Monsanto*, 467 U.S. at 1008, the possibility is substantial that there will be modifications of the regulatory requirements. "Those who do business in the regulated field cannot object if the legislative scheme is buttressed by subsequent amendments to achieve the legislative end." *Connolly* v. *Pension Benefit Guar. Corp.*, 475 U.S. 211, 227 (1986) (citation omitted); cf. *Lucas v. South Carolina Coastal Council*, 112 S. Ct. 2886, 2899 (1992) ("[I]n the case of personal property, by reason of the State's traditionally high degree of control over commercial dealings, [the property owner] ought to be aware of the possibility that new regulation might even render his property economically worthless * * *."). Participants in a highly regulated industry are "on notice that [they] might be subjected to different regulatory burdens over time." *California Housing Secs., Inc.* v. *United States*, 959 F.2d 955, 959 (Fed. Cir. 1992), petition for cert. filed, 61 U.S.L.W. 3083 (U.S. July 22, 1992). In contrast, a regulatory scheme that appears suddenly may interfere with a company's reasonable expectations. Id.

It is not reasonable for a company to expect to be able to continue indefinitely to use a brand name that contains a defined nutrient content claim. Such an expectation would ignore FDA's power to regulate the food label, the regulatory environment of the food industry, and the foreseeability that FDA would regulate health and content claims on the food label.

FDA's authority to regulate the food label is broad and longstanding. Governmental authority to regulate the food label has long been recognized. For example, the Supreme Court stated in 1919 that "it is too plain for argument that a manufacturer or vendor has no constitutional right to sell goods without giving to the purchaser fair information of what it is that is being sold." *Corn Products Refining Co.* v. *Eddy*, 249 U.S. 427, 431 (1919). With the 1990 amendments, Congress did not suddenly grant the agency new authority of the sort that interfered with a company's reasonable expectations about the way the food label would be regulated, see *California Housing Secs.*, 959 F.2d at 959, but rather clarified FDA's authority to define nutrient content claims. The authority granted by the 1990 amendments was consistent with FDA's existing power over the food label. For example, FDA already had authority to define common or usual names for food and to set standards of identity. See, e.g., *American Frozen Food Inst.* v. *Mathews*, 413 F. Supp. 548 (D.D.C. 1976), aff'd, 555 F.2d 1059 (D.C. Cir. 1977). Moreover, under preexisting authority—e.g., sections 201(f) and (n) and 403(a) and (j)—the agency had regulated or taken steps to regulate nutrient content claims on the food label. Although FDA had earlier regulated the use of certain nutrient content claims, the 1990 amendments gave the agency specific authority to define terms such as "light" and "low" consistently across product categories. See, e.g., 136 Congressional Record H12953–54 (Oct. 26, 1990) (statement of Rep. Madigan).

Moreover, the food industry is highly regulated. Companies are well aware that they operate subject to the restrictions of the act. Like other regulatory schemes, the act has not been static, see *California Housing Secs.*, 959 F.2d at 959, and companies that are subject to the act should understand the possibility that its requirements will evolve over time. The food industry has long been "the focus of great public concern and significant government regulation," and "the possibility was substantial" that the government would, "upon focusing on the issue," decide that the actions now being undertaken are in the public interest. *Monsanto*, 467 U.S. at 1009.

Not only was the industry on notice that the regulatory scheme under which it operated might be amended, but it also had specific notice of the type of action FDA might take with respect to the food label. FDA promulgated regulations on the use of certain nutrient content claims years before the 1990 amendments were passed. The terms "sodium free," "very low sodium," "low sodium," and "reduced sodium" are defined in current § 101.13. Current § 101.25 governs information that may appear on food labels regarding fat, fatty acid, and cholesterol content. Current § 105.66 controls the use of the claims "low calorie," "reduced calorie," and "sugarfree." It would be unreasonable for a company to expect that the agency would forever

refrain from further regulation of nutrient content claims.

Thus, companies that use brand names that contain express or implied nutrient content claims lack a reasonable investment-backed expectation that they will be able to continue to use those names. Only with the passage of the 1990 amendments and the publication of these final rules does the possibility arise that a company might have a reasonable investment-backed expectation in continuing to use an approved claim. See *Ruckelshaus* v. *Monsanto Co.*, 467 U.S. at 1010–1013.

The final factor that courts consider is the economic impact of the governmental action. "There is no fixed formula to determine how much diminution in market value is allowable without the Fifth amendment coming into play." *Florida Rock Industries, Inc.* v. *United States*, 791 F.2d 893, 901 (Fed. Cir. 1986), cert. denied, 479 U.S. 1053 (1987). It is clear, however, that a regulation's economic impact may be great without rising to the level of a taking. See *Pace Resources*, 808 F.2d at 1031 (citing *Hadacheck* v. *Sebastian*, 239 U.S. 394 (1915) (reduction in value from $800,000 to $60,000); *Euclid* v. *Ambler Realty Co.*, 272 U.S. 365 (1926) (75 percent diminution in value)). Mere denial of the most profitable or beneficial use of a property does not require a finding that a taking has occurred. *Tirolerland, Inc.* v. *Lake Placid 1980 Olympic Games, Inc.*, 592 F. Supp. 304, 313 (N.D.N.Y. 1984); see also *Andrus* v. *Allard*, 444 U.S. 51, 66 (1979); *Florida Rock*, 791 F.2d at 901. Rather, courts look for extensive or drastic interference with a property's possible uses. See *Pace Resources*, 808 F.2d at 1031.

In assessing whether a regulation effects a taking, the Supreme Court has considered whether the regulation denies an owner the "economically viable" use of its property. See, e.g., *Keystone*, 480 U.S. at 499. This analysis involves looking not just at what has been lost, but at the whole "bundle" of property rights. *Andrus* v. *Allard*, 444 U.S. at 65–66. Courts focus on the remaining uses permitted and the residual value of the property. *Pace Resources*, 808 F.2d at 1031. Although it is undeniable that compliance with these regulations will cost money and may mean that certain product names must be altered, companies will not be denied the economically viable use of their property.

Many firms will be able to minimize the regulations' impact by reformulating those products that do not meet the regulations' definitions. These reformulated products could continue to bear the original brand name. Reformulation may be costly, but it is not the kind of economic impact that leads to a taking. "Requiring money to be spent is not a taking of property." *Atlas Corp.*, 895 F.2d at 756. Nor may companies argue, as one comment did, that their legal and other costs of seeking compensation for losses from these regulations should be included in the assessment of economic impact. These costs are not included in calculating just compensation under the fifth amendment. *United States* v. *Bodcaw Co.*, 440 U.S. 202, 203 (1979); *United States* v. *101.80 Acres*, 716 F.2d 714, 717 n.5 (9th Cir. 1983).

Other companies may be able to continue using their brand names with some, but not all, of their products. These companies will retain a residual economically viable use of their brand names. These companies will retain the ability to use their brand names on some of their products. Those with trademarks will also retain the important right to prevent other companies from marketing under the protected name. See *PruneYard Shopping Center* v. *Robins*, 447 U.S. 74, 82 (1980) ("[O]ne of the essential sticks in the bundle of property rights is the right to exclude others."). They would, moreover, be able to market new products that meet the applicable definition under the brand name. And finally, those foods that could not be marketed under the original brand name may continue to be sold under another name that does not violate the regulations.

It is unlikely that these regulations will force any company to stop using a brand name entirely. However, even if these regulations do have such an effect, the economic impact of this loss, without more, would not establish a taking. It is also critical to consider the character of the Government's action and its interference with reasonable investment-backed expectations. In addition, a company in this position lacks a property right to continue marketing a product under a defined term that its food does not meet. See 56 FR 60356 at 60865, November 27, 1991. For example, a food that bears a "light" claim but does not meet the definition of "light" and cannot be reformulated as a "light" product is not light and should not be called "light." Such a product is misbranded not only under section 403(r) of the act but also under section 403(a)—that is, even before the passage of the 1990 amendments, its labeling was false or misleading and in violation of the act. See *Lucas* v. *South Carolina Coastal Council*, 112 S. Ct. 2886, 2901 (1992) ("The use of these properties for what are now expressly prohibited purposes was always unlawful * * *.").

310. One comment inquired why, if so many misbranded products were on the market before the 1990 amendments, FDA did not take action to stop the misbranding.

In fact, FDA did send warning letters to a number of manufacturers who were making misleading claims. In virtually all of these cases, the manufacturer removed the misleading claim from the product. The agency would have done more but for lack of resources. In addition, consumer confusion resulted as much from the lack of any defined standards for claims as from individual claims that were objectionable. To solve the problem, it was necessary to address it globally by developing a regulatory scheme designed specifically for nutrient content claims.

311. One comment argued that to avoid an unnecessary taking, the agency should interpret section 403(r)(2)(C) of the act (the grandfather clause) to apply to product line extensions. The comment asserts that section 403(r)(2)(C) of the act is ambiguous and reads FDA's proposed implementing regulation (proposed § 101.13(o)(1)) to extend grandfathering to new products introduced under an existing brand name.

FDA does not believe the grandfather clause is ambiguous but has revised its regulation (new § 101.13(p)(1)) to clarify that the grandfather clause does not apply to product line extensions. The grandfather clause provides that unapproved nutrient content claims that are part of the brand name of a food are permitted if the brand name was in use *on the food* before October 25, 1989—not if the brand name was being used on some other food before that date (emphasis added). Therefore, new products introduced under the same brand name are not covered. Any company that started using a preexisting brand name on a new product after the grandfather date did not have a reasonable expectation of being able to use the name on that product. Therefore, the regulation does not effect a taking.

312. Another comment contended that the wording of the grandfather clause demonstrates that a product whose brand name includes an undefined nutrient content claim is not necessarily misbranded under section 403(a) of the act, which proscribes false and misleading labeling. The comment reasoned that, where there are two brand names that contain the same undefined claim—one grandfathered, one not—it would be absurd to say that

the nongrandfathered brand name is misleading, but that the grandfathered brand name is not.

The agency agrees that a grandfathered brand name is not necessarily false or misleading under section 403(a) of the act, nor is a nongrandfathered brand name that makes the same claim. A product with a nongrandfathered brand name that makes an unapproved nutrient content claim is misbranded under the 1990 amendments, however, because they prohibit the use of undefined claims. See section 403(r)(1)(A) of the act. Moreover, after the claim has been defined, both the grandfathered and nongrandfathered product will be misbranded under both section 403(a) of the act and the 1990 amendments if they do not conform to the definition. (See section 403(r)(2)(C).)

It should be noted that Congress did not make a judgment as to whether grandfathered brand names are misleading or nonmisleading; rather, it decided not to disrupt the market until FDA had a chance to define the terms used in grandfathered brand names. There is no taking of an undefined, nongrandfathered brand name because companies had no reasonable investment-backed expectation of being able to use undefined claims after the 1990 amendments were reported out of committee.

It should be pointed out that it is the statute, not FDA's regulations, that forbids the use of undefined terms in nutrient content claims.

313. The same comment argued that because the Patent Office considers the comment's trademark nondeceptive, the company has a reasonable, investment-backed expectation of being able to use the trademark.

The agency disagrees. FDA, not the Patent Office, has primary expertise in food labeling, and FDA does not consider itself bound by the Patent Office's decision as to whether a trademark is misleading.

314. Two comments argued, citing FTC case law, that the policy of the law to preserve trade names protects them from destruction if less drastic means would prevent deception. See *Jacob Siegel Co.* v. *FTC*, 327 U.S. 608, 612 (1946); *FTC* v. *Royal Milling Co.*, 288 U.S. 212, 217 (1933). The comments argued that prohibiting certain brand names is inappropriate because deception can be prevented by adding disclaimers or explanations to the brand names. One comment said the cited cases are rooted in takings doctrine. The other asserted that these cases are based on first amendment principles. See *Beneficial Corp.* v. *FTC*, 542 F.2d 611, 620 (3d Cir. 1976), cert. denied, 430 U.S. 983 (1977).

FDA disagrees with these comments. According to *Jacob Siegel Co.*, whether prohibition of a trade name is necessary "is a question initially and primarily for the [agency] * * * [which] is the expert body to determine what remedy is necessary to eliminate the unfair or deceptive trade practices which have been disclosed." 327 U.S. at 612. In another case, the Supreme Court upheld the prohibition of a trade name when, in the agency's judgment, the prohibition was necessary to prevent deception. *FTC* v. *Algoma Lumber Co.*, 291 U.S. 67, 81–82 (1934). With respect to food labeling, no disclaimer or explanation could eliminate the deceptive effect of a brand name that incorporates an FDA-defined term if the food on which the brand name appears does not meet the definition of that term.

The Supreme Court recently acknowledged the protection given to trade names in *Jacob Siegel* and *Royal Milling*, which were decided under section 5 of the Federal Trade Commission Act (15 U.S.C. 45) (the FTC act), but also recognized that those decisions rested on statutory—not constitutional—grounds. The court made clear that the holdings of those decisions do not carry over to cases decided on first amendment principles alone:

> [T]here is no First Amendment rule, comparable to the limitation on § 5, requiring a State to allow deceptive or misleading commercial speech whenever the publication of additional information can clarify or offset the effects of the spurious communication. *Friedman* v. *Rogers*, 440 U.S. 1, 12 n.11 (1979). Like the first amendment, the act contains no limitation comparable to section 5 of the FTC act.

Finally, FDA is not bound to follow FTC case law. Although cases involving FTC may sometimes be relevant, it is important to note that fundamental differences exist between the regulatory schemes administered by the two agencies. See *Bristol-Myers Co.* v. *FTC*, 738 F.2d 554, 559 (2d Cir. 1984), cert. denied, 469 U.S. 1189 (1985). Congress has long recognized the division of roles between the two agencies. See 79 Congressional Record 4749 (1935), reprinted in "Federal Food, Drug, and Cosmetic Act: A Statement of its Legislative Record" 280–81 (Charles W. Dunn ed., 1938) (statements of Senators Copeland and Austin) (FTC concentrates on the interests of commerce and economic needs, whereas the objective of FDA is "the health of the people"). The FTC regulates unfair competition and trade practices, including food advertising. See, e.g., 15 U.S.C. 45 and 52. In contrast, FDA is a scientific agency empowered to regulate the food label, among other things. Thus, FTC case law does not govern FDA regulation.

VII. Other Issues

315. One comment stated that because of the range of meanings already attached to terms such as "light," "low," "free," "source of," and "reduced," FDA's attempt to define such terms will not be completely successful at eliminating confusion. The comment suggested that a better approach would have been for FDA to create a set of terms, either chosen from words not currently used in relationship to food or completely made up, to attach to their definitions instead of attempting to define terms already in vogue.

In response to this comment addressing the agency's basic approach to defining terms used to make nutrient content claims, the agency advises that many of the terms that it is defining are those that the 1990 amendments require the agency to define. Section 3(b)(1)(A)(iii) of the 1990 amendments directs the agency to define the terms "free," "low," "light" or "lite," "reduced," "less," and "high" when these terms are used to characterize the level of any nutrient in food, unless it finds that the use of such terms would be misleading. The agency has not found that any of these terms are misleading per se, although some consumer confusion as to their meanings may exist as a result of the variety of ways in which they have been used in the marketplace. Providing regulatory definitions for these terms that must be used by any manufacturers that use these terms in their labeling should alleviate or eliminate confusion. Therefore, the agency does not have the prerogative of creating a set of terms for nutrient content claims that have not previously been associated with claims for food as the comment suggested.

316. One comment stated that nutrient content claims such as "free," "low," and "reduced" should be defined for modified lactose levels in foods.

The agency does not agree with this comment. These regulations are intended to define nutrient content claims for categories of nutrients or individual nutrients that are required for maintaining a diet that meets current dietary guidelines (e.g., fiber, cholesterol, and fat). Lactose, a sugar that occurs in milk, is not a nutrient addressed in current dietary guidelines. However, labeling in regard to the lactose content of a food does have

significance for individuals who cannot tolerate this nutrient. FDA advises that provisions for the labeling of hypoallergenic foods are in § 105.62.

317. A comment stated that someone will still have to "educate" consumers about the meaning of the terms that FDA is defining. Another comment recommended that since terms are meaningless without the definitions to help distinguish among them, glossaries of allowed nutrient content claims should be available at points of purchase in the form of posters and free pamphlets. An alternative suggested in the comments was to abandon the effort to simplify nutrition information for consumers, to disallow claims on labels, and to educate consumers to interpret nutrition labels.

FDA does not agree that it should disallow claims on labels and instead only educate consumers to interpret nutrition labels. FDA believes that claims serve to highlight important nutritional aspects of foods, and as a result, they assist consumers in the identification and selection of foods that are useful for meeting dietary goals.

FDA agrees that educational programs will be necessary to develop consumer and industry understanding of the regulatory definitions. Section 2(c) of the 1990 amendments calls for activities that educate consumers about nutrition information on the food label and the importance of that information in maintaining healthy dietary practices. To achieve this purpose, FDA and USDA have jointly initiated a multi-year food labeling education campaign. The major goals of this campaign are to: (1) Increase consumers' knowledge and effective use of the new food label and to assist them in making accurate and sound dietary choices; (2) to integrate food labeling education into existing and new nutrition and health education programs; and (3) to build extensive partnerships capable of developing and evaluating labeling education targeted to the dietary needs of diverse populations, such as low literacy consumers, minorities, older Americans, children, and people with dietary restrictions.

As part of this effort, the agencies have established the National Exchange on Food Labeling Education which includes an information center housed in the Food and Nutrition Information Center at the National Agricultural Library. It provides the general public and professionals with access to information about food labeling research and educational activities (projects, programs, and materials) from both the public and private sector. Together, the agencies will facilitate cooperative projects with diverse organizations and the communication of information that targets various subpopulations as well as the general public. Thus, the agencies are developing an extensive food label education network that includes consumers; health professionals and organizations; educators; trade associations; Federal, State, and local governments and many others, to assist in the dissemination and development of information and activities.

To ensure that consumers have accurate and adequate resource materials and information, the agencies have begun, and will continue to: (1) Conduct and report on existing and planned food labeling research; (2) develop education initiatives at the national and local levels; (3) hold regularly-scheduled meetings to build labeling education exchanges; (4) produce video news releases and longer videos; and (5) produce an array of public education materials, including a special edition of *FDA Consumer* magazine that summarizes the final food labeling regulations, and brochures (in English and other languages) on the new label and how to use it to meet the Dietary Guidelines for Americans. These materials will be targeted to the general public, nutritionists, such special groups as ethnic minorities, and others. Organizations will also be able to use these resource materials to develop educational materials of their own.

318. Several comments stated that the proposed rules define claims so narrowly and require such burdensome disclosure requirements that manufacturers would have little or no incentive to develop new nutritionally improved products to qualify for nutrient content claims, to make substantial investments in research and development, or to develop the supporting manufacturing marketing capabilities.

The agency agrees that new products that are truly nutritionally improved can make positive contributions to public health. Thus, FDA is sensitive to the concerns raised by the comments that the proposed definitions could inhibit innovation. In response, FDA has attempted in the final regulations to make the definitions more flexible, while at the same time ensuring that the terms will be useful in maintaining healthy dietary practices and will be used in a manner that is truthful and not misleading. FDA believes that the final regulations, as revised, will stimulate innovation in food product research and the development of new versions of foods and food formulations that will meet the definitions, because nutrient content claims are an important aspect of a product's marketability.

319. Several industry comments stated that because these regulations depart significantly from the European Community (EC) nutrition labeling directive and from the Food Agricultural Organization/World Health Organization (FAO/WHO) Codex International recommendations, they will impede the resolution of differences under the General Agreement on Tariff and Trade.

The agency recognizes that the 1990 amendments and substantive provisions of these regulations are not in complete accord with the FAO/WHO Codex food labeling regulations or with regulations or directives of the EC or other countries. The agency also recognizes that this is an area that the FAO/WHO Codex has not yet addressed. Therefore, the regulations may have an impact on the resolution of issues related to international trade. However, these regulations are fully responsive to the 1990 amendments. The agency believes that these regulations will provide U.S. consumers with accurate and reliable information, information that consumers in other countries could use and may demand of their food regulators. The agency believes that the principles of these regulations may be adopted by other countries and serve as a basis for harmonization. This agency is committed to working with representatives of other nations and international organizations to achieve the greatest degree of harmonization possible.

VIII. Terms that Describe Other Aspects of Food

A. "Fresh" and Related Terms

The 1990 amendments do not require that FDA define labeling terms such as "fresh" that do not make nutrient content claims. However, the continued misuse of "fresh" and related terms in the marketplace, and the consumer confusion that has resulted, led the agency to propose definitions in the general principles proposal that establish labeling regulations to govern the use of "fresh," "freshly——" (e.g., "freshly baked"), and "fresh frozen" as they appear on the label or in the labeling of foods, including the use of these terms in brand names and as sensory modifiers (fresh tasting) (56 FR 60421 at 60462).

FDA also identified several questions in the general principles proposal regarding the use of the term "fresh" and solicited comments on whether these should be addressed in the final rule. The agency asked whether: (1) It

should allow the use of the term "fresh" to describe certain raw foods that have been treated with ionizing radiation in accordance with § 179.26 (21 CFR 179.26), specifically, those foods where irradiation at a maximum dose of 1 kiloGray (100 kilorads) is permitted; (2) it is appropriate to limit use of the term "freshly ——— " to foods that are available for sale within 24 hours of preparation as the agency proposed, or whether other approaches to defining this term should be considered and incorporated into the final rule; (3) it would be misleading to allow the use of the term "freshly prepared" to describe recently prepared foods that contain processed ingredients; (4) it is important to the consumer to be able to distinguish between processed products made with fresh, as opposed to processed ingredients, and whether FDA should permit the use of a factual statement such as "spaghetti sauce—made with fresh mushrooms" on processed foods made from fresh as opposed to processed fruits and vegetables. Related to this issue, FDA requested comments on whether the inclusion of blanching as part of a continuous process at a facility should preclude labeling the ingredient as fresh; (5) the use of remanufactured ingredients affects the attributes of a finished product, such as a tomato product, to such a degree that the consumer is misled about the product if its labeling does not specifically declare the remanufactured nature of the ingredient. The agency asked whether it should require the use of a term such as "reconstituted," "remanufactured," or "made from concentrate" on the PDP of processed products made from remanufactured ingredients; and (6) extended shelf life foods merit the use of the term "freshly prepared," and if so, what factors should be considered to ensure that the term is not used in a misleading manner.

320. Several comments objected to the agency issuing a regulation that would define "fresh" and related terms while it is implementing the mandatory requirements of the 1990 amendments. These comments argued that a regulation governing the use of the term "fresh" is not mandated by the 1990 amendments and does not meet the President's reform directive of January 28, 1992. Some of these comments urged FDA to defer rulemaking on use of the term "fresh" until after it completes the mandatory rulemaking required by the 1990 amendments.

The agency does not agree that it should defer rulemaking to define "fresh." Although the 1990 amendments do not require the agency to define the term "fresh," FDA believes that a definition for certain uses of the term "fresh" is necessary because the term has been continuously misused in certain contexts. FDA concludes that a regulatory definition will discourage such misuse and will allow the agency to efficiently enforce the misbranding provisions of the act, particularly section 403(a) of the act, when the term is misused.

In issuing regulations concerning use of the term "fresh," the agency has also taken into account the requirements outlined in the President's reform directive regarding burdensome government regulations. Having concluded that it is necessary to promulgate regulations concerning use of the term "fresh," the agency considers that taking such action at this time is the most cost effective option because any required labeling changes that result from this action can be accomplished simultaneously with the label changes required by the 1990 amendments.

321. Comments addressing the proposed definition for the term "fresh" expressed widely diverse views on this subject. The agency received comments that supported the proposed definition, suggested alternatives to it, opposed the provision as proposed, or opposed FDA defining the term altogether.

Comments suggested that "fresh" should be defined as recently made, produced, or harvested foods that are not stale, spoiled, or withered. Numerous comments suggested that in addition to defining "fresh" as meaning raw and unprocessed, the term can also be associated with product quality, and therefore, a case-by-case determination may have to be made to determine where misleading uses of "fresh" have occurred rather than establishing one definition for the term. Some other comments contended that "fresh" has various meanings, and that the context in which it is used should ultimately dictate its meaning. One comment argued that the term "fresh" should be defined in such a way to distinguish between "garden fresh" and "market fresh."

Some comments that favored a regulation to govern the use of "fresh" suggested that the term should not refer to products prepared from concentrates, to commercially packed pasteurized products, or to products that are stored in cold storage warehouses until they are marketed. Some of these comments also stated that raw produce that has been trimmed or cut into smaller pieces should not be precluded from being described as fresh.

Some comments suggested that the proposed definition was too restrictive and did not consider the many ways consumers use and understand "fresh" because, as defined in the proposal, the term could only be used to describe raw, unprocessed foods. For example, these comments pointed out that, as proposed, the term "fresh" could not be used to describe some foods that are generally accepted by consumers as "fresh," such as fresh bread and pasteurized milk.

Some comments argued that there are numerous consumer perceptions associated with the term, and therefore, it is impossible to derive one definition that is universally acceptable. Another comment suggested that FDA should not permit the use of the term "fresh" on food labels because it is too difficult to define the term in a manner that would encompass all of the ways consumers use and understand it.

The volume of comments that expressed significantly different conceptions about the term "fresh," and that expressed reservations about the proposed definition of "fresh," has led FDA to reconsider this provision. FDA has been persuaded that the proposal was too restrictive, because it did not allow for various contexts in which "fresh" is appropriately used and would have disallowed uses of this term that are not misleading and are widely accepted by consumers ("fresh bread"). After considering all of the comments, FDA concludes that it is not necessary to establish a definition for "fresh" that would address all uses of this term as the proposal would have done.

However, FDA concludes that a definition for "fresh" is necessary to preclude the types of misuses of the term that the agency most frequently encounters, i.e., use of the term to imply that a product is unprocessed, when in fact it has been processed. The definition has particular applicability where there are processed and unprocessed forms of the food available. The use of the term "fresh" would imply that the food is the unprocessed form. If this is not the case, the food is misbranded. Therefore, FDA has revised the definition of "fresh" in § 101.95(a) so that it retains the same criteria that were in the proposal, but it only applies the criteria when the term "fresh" is used in a manner that suggests or implies that the food is unprocessed.

FDA is providing some examples of how certain foods relate to the definition of "fresh." These examples are intended to be illustrative. Except in a few cases where FDA believes clarification is necessary, FDA is not providing specific guidance in this final

rule on the many types of foods for which comments stated an opinion concerning the appropriateness of the use of the descriptive term "fresh." Under the definition of "fresh" that the agency is establishing, foods such as cut raw vegetables and expressed juices from raw produce could bear the term "fresh" on the label because these foods meet the requirements of the definition. However, if the term "fresh" were used to describe a pasteurized orange juice, that term would misbrand the product because when used in this context, the term implies that the food is unprocessed (e.g., fresh squeezed orange juice), when in fact it is a pasteurized food.

By contrast, in the case of pasteurized milk that is labeled as "fresh," such a food would not be subject to new § 101.95(a) because this term does not imply that milk is unprocessed inasmuch as consumers recognize that milk is nearly always pasteurized, and that unpasteurized milk (in states where it is permitted to be sold) would be labeled as "raw" milk. Also, the term "fresh" as used on bread would not be subject to new § 101.95(a) because bread is not a food that exists in a raw state, and the term "fresh bread" does not imply that the food is unprocessed and in its raw state. For clarity, FDA is including milk in § 101.95 as an example of a use of the term "fresh" that is not subject to this regulation, and pasta sauce as an example of a food that is subject to this regulation.

The agency advises that uses of the term "fresh" to describe foods that do not suggest or imply that a food is unprocessed will not be subject to the definition established for "fresh." However, all uses of this term in food labeling are subject to the requirements of 403(a) of the act, the act's prohibition of false or misleading labeling. Therefore, the agency has the authority to take action on a case-by-case basis against foods that use the term "fresh" on the label in a manner that is false or misleading, even though the food may not be subject to new § 101.95(a).

322. One comment stated that the agency should adopt FSIS' policy memo 022C that outlines conditions in which the term "fresh" can be used on approved labeling of meat and poultry products. FSIS' policy memo 022C states that the term "fresh" may not be used as part of a name on any product that is canned, cured, dried, chemically preserved, or hermetically sealed. In addition, FSIS' policy memo 022C states that "fresh" may not be used on any poultry or poultry part that has been frozen or previously frozen at or below zero degrees Fahrenheit.

FDA does not find it appropriate to adopt FSIS' policy memo 022C that addresses use of the term "fresh" on the labeling of meat and poultry products. Although the memo has provided FDA with useful information in formulating its "fresh" policy, the reference of the policy memo is limited in that it specifically addresses meat and poultry products and the conditions under which they are sold. Therefore, the agency does not find merit in the suggestion that it adopt the provisions set forth in that policy memo.

323. Several comments addressed the use of "fresh" as it relates to crabmeat. Comments on this issue urged FDA to reconsider its definition for "fresh" because as proposed, it would prohibit the use of this descriptor to describe crabmeat. These comments argued that it is not feasible for consumers to purchase raw crabmeat, and, furthermore, use of the term "fresh" has been traditionally associated with crabmeat that has been cooked and picked but not subjected to any other processing procedures. Other comments stated that some consumers look for the term "fresh crabmeat" as a way of distinguishing it from pasteurized crabmeat that is a lower price and that requires special handling.

FDA finds that the terms "fresh" or "fresh picked" as used to distinguish picked crabmeat from pasteurized crabmeat is not a use of the term "fresh" that implies that the food is unprocessed (as it is understood to mean that the food has been cooked and is not raw), nor is it misleading to consumers who are accustomed to this usage. Therefore, such use of the term is not subject to new § 101.95(a), and FDA will not object to such usage of the term.

324. One comment disagreed with some of the proposed exemptions that allowed for use of the term "fresh," i.e., (1) If an approved wax or coating has been applied to raw produce, (2) if a mild chlorine or mild acid wash has been applied to raw produce, or (3) if raw produce has been treated with approved pesticides after harvest. The comment stated that it is misleading to use the term "fresh" to describe raw produce that has been washed with a chlorine or mild acid wash, waxed, or treated with an approved pesticide. However, another comment suggested that the agency should permit use of the term "fresh" on foods whose surface is treated with ascorbic acid, calcium chloride, citric acid, potassium chloride, or sodium bisulfite, provided that these treatments are used at levels allowed by FDA regulations. The comment argued that these treatments affect a food's surface, and that they do not appreciably affect the body or alter the state of the food.

The agency does not agree that surface treatments such as waxing, washing with a mild chlorine or a mild acid wash, or the use of an approved pesticide should preclude describing the food as "fresh." As stated in the proposal, these applications are recognized as routine practices in the distribution and handling of raw produce. However, the agency does not agree that the use of the term "fresh" is appropriate if a food has been subjected to chemical treatments, including but not limited to antioxidants, antimicrobial agents, or preservatives, that introduce chemically active substances that remain in or on the food to preserve or otherwise affect the food. Thus, FDA is not providing for the use of the term "fresh" on foods that have been treated with the substances listed in the second comment. FDA is, however, retaining the exempting provisions in the final rule and is redesignating them as § 101.95(c)(1).

325. A number of the comments stated that use of low dose ionizing radiation has little effect on the attributes of a food in its raw state, and that "fresh" labeling should be permitted for foods that have been treated with low dose ionizing radiation. Other comments that supported the use of the term "fresh" on some irradiated foods suggested that irradiation enables a product to remain wholesome.

A small number of comments argued that use of the term "fresh" to describe certain irradiated raw foods would be misleading because irradiation is considered to be a form of processing that results in a loss of vitamins in foods. The comments also stated that safety procedures have not been established for irradiated foods, and that irradiation may affect the food in some unhealthful way. None of the comments that opposed the use of ionizing radiation on raw unprocessed foods provided the agency with supporting data to substantiate these claims. A few comments suggested that the labeling information associated with irradiated foods should state whether the food has been exposed to gamma or ionizing radiation from man-made sources. The majority of the comments agreed that the agency should require comprehensive and informative labeling on any raw unprocessed food that has been irradiated.

After reviewing the comments pertaining to the use of "fresh" to describe foods that have been exposed to ionizing radiation, the agency notes

that the concerns expressed relate primarily to safety and to the use of appropriate labeling to identify foods that have been irradiated. These comments appear to confuse safety and proper identification of foods that have been irradiated with perceptions related to the state of freshness of these foods. None of the comments, however, provided information to support the contention that use of currently approved low doses of irradiation on raw foods (not exceeding 1 kiloGray (100 kilorads)) would degrade the characteristics of a food associated with a food's raw state.

Under the provisions of § 179.26(b), irradiation of fresh foods is limited to the use of low dose irradiation (not to exceed 1 kiloGray) for the purpose of disinfestation of arthropod pests in food, for growth and maturation inhibition of some fresh foods, and for control of Trichina spiralis in pork carcasses. In approving these uses of irradiation, the agency concluded that foods treated with the approved levels of ionizing irradiation are safe. FDA requires that retail packages and bulk containers of such food bear a unique logo that distinguishes irradiated from nonirradiated foods and the statement "treated with radiation" or "treated by irradiation" (§ 179.26(c)). Therefore, FDA concludes that the safety and proper identification of any food that has been treated with low dose ionizing irradiation is not relevant in determining whether food that is "fresh" under § 101.95 before irradiation can continue to be described as "fresh" after such treatment.

The test for determining the appropriateness of applying the term "fresh" to foods treated with post harvest applications, including treatment with low dose irradiation, is the effect that the process has on a food. The low doses of irradiation approved for fresh foods (less than 1 kiloGray) are used to prevent maturation (sprouting) and to kill insects (§ 179.26(b)). Exposure of raw food to low dose irradiation typically causes insignificant changes in their appearance and nutrient content. While it is true that certain vitamins are sensitive to irradiation, the available literature indicates that foods irradiated at levels below 1 kiloGray are not nutritionally inferior to unirradiated foods (51 FR 13376, 13381, April 18, 1986).

The agency is not aware of any information that suggests that low dose (up to 1 kiloGray) irradiation of raw foods causes adverse changes in their physical or sensory qualities that would affect consumer's perceptions as to whether they are raw. Therefore, in the absence of meaningful differences in the appearance and quality between pre- and post- irradiated foods, and in light of the requirement that irradiated foods must be clearly labeled as such, the agency believes that it is appropriate to provide that the term "fresh" may be used to describe foods that have been treated with ionizing radiation at a maximum dose of 1 kiloGray (100 kilorads) in accordance with § 179.26(b) and that otherwise meet the requirements of new § 101.95(a). Accordingly the agency is adding an exemption for treatment with irradiation to new § 101.95(c)(iv).

326. None of the comments objected to the agency's position that use of the term "fresh" is appropriate to describe raw, unprocessed foods that are refrigerated and that otherwise meet the definition of "fresh."

Although refrigeration is a means of preserving food, consumers apparently generally regard raw unprocessed foods that are refrigerated as "fresh" (e.g., "fresh" produce). The agency also believes that consumers are not misled when the term "fresh" is used to describe raw unprocessed foods that are refrigerated. Accordingly, the agency is retaining in new § 101.95(c)(2) the provision that states that a food that meets the definition for "fresh," and that is refrigerated, is not precluded from the use of the term "fresh" under this regulation.

327. Many comments objected to the agency's proposed definition for the term "freshly prepared." Some of these comments pointed out that one of the major limitations associated with the proposed definition of "freshly prepared" is that bakery products (including bread) would not merit use of the term "fresh baked" because, in most cases, it is a common practice for the baking industry to utilize mold inhibitors. Other comments stated that consumers recognize baked bread containing mold inhibitors as "fresh baked" and are not misled by the use of this terminology. Numerous related comments suggested that bread and other bakery products (regardless of whether they contain mold inhibitors), should be permitted to use the term "freshly prepared."

Several comments objected to the provision in the proposal limiting the use of "freshly prepared" to foods available for sale within 24 hours after their preparation or production. Comments stated that the agency has no factual or scientific basis on which to impose a 24-hour restriction for prepared foods to qualify to be labeled "freshly prepared." Comments also stated that the 24-hour timeframe is applied inconsistently across the food industry, is unrealistic, and is impossible for most foods to achieve.

A few comments recommended that as an alternative to the 24-hour timeframe associated with "freshly prepared," the agency should consider timeframes such as 12 hours, 72 hours, 10 days from preparation, or 3 to 7 days, with "freshly baked" meaning those products that are baked within a 24-hour timeframe. A small percentage of comments suggested that any time restriction associated with "freshly prepared" should be based on a product's normal shelf life.

A review of the comments has persuaded the agency to reconsider its proposed definition of "freshly prepared." FDA now recognizes several problems with this proposed definition. First, the comments have persuaded the agency that the 24-hour timeframe proposed for the term "freshly prepared" is impractical and impossible to apply to foods across the board because of the diversity of foods in the marketplace that could be described as "freshly prepared." Additionally, no practical alternatives for defining "freshly prepared" were presented to the agency. To the contrary, because of the wide variety of contexts in which the term could be used to describe foods, FDA doubts that a practical definition for "freshly prepared" that would address all uses of the term is achievable.

FDA has thus reconsidered whether a need exists for a regulatory definition for the term "freshly prepared." First, FDA believes that systematic misuse of terms such as "freshly prepared" is not a significant problem in the marketplace. FDA is not aware of widespread misuse of this term. Further, as stated above, any use of terms such as "freshly prepared" are subject to the requirements of section 403(a) of the act, which prohibits false or misleading labeling. Therefore, the agency has the authority to take action on a case-by-case basis against foods that use the term "freshly prepared" on the label in a manner that is false or misleading. Given these factors, FDA believes that a definition of this term is not necessary to enable the agency to effectively enforce the provisions of the act that forbid false or misleading labeling on foods, and accordingly, FDA is withdrawing the proposed definition for "freshly prepared."

328. Several comments agreed with the agency's longstanding policy that use of the term "fresh frozen" is appropriate to describe a food that is quickly frozen while still "fresh." One comment requested that FDA extend the

proposed definition for "fresh frozen" to include foods such as "fresh" vegetables that are blanched before blast-freezing.

The agency agrees with the comment that foods blanched before blast-freezing merit use of the term "fresh frozen." Upon review of the literature, FDA finds that the blanching of vegetables before freezing is essential to prohibit the development of off-colors, off-flavors, and other kinds of enzymatic spoilage that are known to develop over a period of time in the frozen product (Ref. 30). Therefore, FDA is including a provision in new § 101.95(b) that provides for use of the term "fresh frozen" on raw foods that are blanched before blast-freezing.

329. Several comments requested that FDA reconsider the provision in the proposal that a food must comply with the definition of "fresh" for the term to be used in its labeling as part of a brand name. Some of these comments expressed the concern that prohibiting the use of "fresh" in brand names would mean banning the use of many brand names and trade names (some that are registered trademarks) that have been used for years in a nonmisleading manner.

The agency has reviewed the comments regarding the use of "fresh" in brand names. FDA is aware that situations exist where "fresh" is employed as an integral part of some brand names. In addition, the agency recognizes that some brand names are registered trademarks, and it is not uncommon for these brand names to be used as part of a company logo or on company promotional material.

The use of the term "fresh" on a food label in any manner, including its use in a brand name, is misleading if the use implies that the food is unprocessed when in fact it has been processed. Further, some of the instances where the term "fresh" has been misused in this regard have involved the use of this term as part of a brand name. For these reasons, FDA concludes that the use of "fresh" as part of a brand name should be subject to the definition it is establishing and is thus retaining reference to the use of "fresh" in a brand name in the introductory paragraph of new § 101.95. If, however, a use of the term "fresh" as part of a brand name does not imply or suggest that the food is unprocessed, and the use is not otherwise false and misleading, there is nothing in this final rule that would prevent this use of the term.

330. A few comments on the use of "fresh" in brand names suggested that FDA should continue to permit the term "fresh pack" on the label of pickles to refer to uncured, unfermented cucumbers packed in a vinegar solution and preserved by either pasteurization or refrigeration. These comments contended that consumers and USDA officials use the term "fresh pack" to distinguish these pickles from brine-cured pickles.

FDA has reviewed these comments. FDA is aware that the term "Fresh Pack" is recognized by USDA to distinguish a certain type of pickles. USDA regulations in 7 CFR 52.1684 specifically state that pickles of fresh-pack type are prepared from uncured, unfermented cucumbers that are packed in a vinegar solution with other ingredients to give the characteristics of the particular type of pickle. They are sufficiently processed by heat for preservation of the product in hermetically-sealed containers. That regulation also identifies characteristics for fresh-pack dill pickles, fresh-pack sweetened dill pickles, fresh-pack sweetened dill relish, fresh-pack sweet pickles, fresh-pack mild sweet pickles, fresh-pack sweet relish, and fresh-pack mild sweet relish, respectively. In recognition of USDA's standards, FDA will not take action against the term "Fresh Pack" when it refers to pickles that are graded according to those standards.

331. Some comments requested that FDA reconsider the provision in the proposal that a food must comply with the definition of "fresh" for the term to be used on its labeling as part of a sensory modifier. Other comments argued that as long as the term "fresh" is not misleading, the agency should permit its use as a sensory modifier, especially in those cases where the term refers to the sensory attributes of a food (i.e., "fresh flavor," "fresh-tasting," "tastes-fresh," "taste as good as fresh,"). However, a small percentage of comments asserted that the use of "fresh" as a sensory modifier is misleading to consumers and should not be allowed in any product.

FDA has considered these comments concerning the use of "fresh" as a sensory modifier. The use of "fresh" on the label of a food, including its use as a sensory modifier, is misleading if it implies that the food is unprocessed when in fact it has been processed. For this reason, FDA concludes that the use of "fresh" as a sensory modifier should be subject to the definition that it is establishing, and therefore the agency is retaining reference to the use of the term "fresh" as sensory modifier in the introductory paragraph of new § 101.95.

332. Several comments stated that a factual statement such as "spaghetti sauce-made with fresh mushrooms" provides useful information about a food product and should be permitted on the label of a processed food made with a fresh ingredient. One comment suggested that such factual statements should be allowed on frozen foods as well. A few comments contended that an ingredient that has undergone processing is no longer "fresh," and that, therefore, the use of such a statement on a processed food made with a fresh ingredient should be prohibited. The comment said that such a statement would be confusing, meaningless, and misleading to consumers. One comment stated that if "fresh" were defined to mean unprocessed as the agency proposed, it would be inconsistent to allow the term to be used to define an ingredient that had been added to the food before processing.

In the general principles proposal, FDA asked for comments regarding the use of these statements on a processed food because it intended to comprehensively regulate the use of the term "fresh" on food labels. Because the agency is taking a more limited approach in this final rule, it does not believe that it is necessary to specifically address the use of the term "fresh" to describe ingredients used in a processed food in its regulation. The agency concludes that this use of the term can be effectively regulated on a case-by-case basis.

FDA believes, however, that consumers generally are not misled when such statements are made about ingredients used in processed foods, provided that the statements clearly refer to the ingredient and do not imply that the food itself is unprocessed. The agency has not received complaints from consumers about this practice, and most of the comments that mentioned this use of the term said that such statements provide useful information. FDA advises that should specific situations arise where such statements are used in a manner that is misleading, the agency will take regulatory action under section 403(a) of the act.

333. Numerous comments expressed the opinion that the inclusion of blanching as part of a continuous process should not preclude labeling an ingredient as "fresh." These comments stated that blanching does not significantly damage the cellular structure of an ingredient and does not affect the taste of a product. A small number of comments argued that blanched ingredients should not be labeled as "fresh," especially if the entire product is heat-treated after the blanched ingredients have been added to the product.

FDA notes that blanching, as addressed here, is a common and sometimes required process that is accomplished by subjecting a food to a set temperature for a specific period of time. This practice is used in many food industries to arrest changes in the flavor profile of the food, to expel air and gases to inactivate food enzymes, and to destroy some microorganisms before the food is processed (Ref. 31). FDA believes that when the blanching operation is part of a continuous process, it is not misleading if the label of the processed product contains a statement such as "made from fresh ——— " because the statement functions to inform the consumer of a noteworthy characteristic of the ingredient (i.e., that the ingredient was fresh, not canned, frozen, or dried at the time the food was processed).

334. Many comments both from industry and from consumers, stated that processed products (particularly tomato products) that are made from remanufactured ingredients should include a statement such as "remanufactured," "reconstituted," or "made from concentrate" on the product's PDP to avoid consumer deception and economic fraud in the marketplace. Other comments expressed the view that organoleptic, quality, and structural differences exist between remanufactured ingredients and fresh ingredients, resulting in significant differences in products made from them. Some comments provided data on these differences.

However, numerous comments opposed requiring a declaration on the PDP that a processed product is made from remanufactured ingredients. Some of these comments stated that FDA lacked legal authority and sufficient analytical and scientific data to promulgate a regulation requiring PDP declaration of the use of remanufactured ingredients, and that before the agency suggests that there is a quality difference between remanufactured tomatoes and raw unprocessed tomatoes, this issue would require further investigation. Some of these comments stated that some existing food standards allow for the use of processed ingredients in processed foods without requiring a declaration about the processed ingredient on the PDP. Therefore, these comments asserted, FDA could not require a declaration on the PDP for remanufactured ingredients without proposing to revise some existing food standards. Some of these comments argued that there was no indication in the rulemaking proceedings for the above food standards that consumers are misled by the lack of PDP labeling.

Some comments urged FDA to separate this issue from this rulemaking and to address the labeling of remanufactured ingredients in a separate proceeding after the agency completes implementing the mandatory requirements of the 1990 amendments.

Other comments on this issue argued that, if the agency were to mandate this requirement, it would impose substantial costs on industry. Another comment implied that use of remanufactured ingredients is necessary because it is impossible for manufacturers to meet the demand of tomato-based products using only fresh tomatoes.

The agency has reviewed these comments and concludes that the issue of labeling for remanufactured ingredients involves matters that go well beyond those that the agency raised in the proposal. There is a large amount of information to be evaluated, and any decision on the issue will have a far reaching impact. Because this rulemaking has been conducted under the very tight time constraints of the 1990 amendments, the agency has not been able to fully evaluate all the information that it has received in comments or to develop appropriate provisions for a regulation. In addition, before FDA published the general principles proposal, the California Tomato Packers had submitted a petition (Docket No. 90P–0430) concerning, among other things, declaration of remanufactured ingredients in finished tomato products. This petition includes data and other information and is undergoing agency review.

However, the 1990 amendments do not require that FDA address this issue, and the time constraints in those provisions therefore are not applicable. The agency is persuaded that some of the issues discussed in the proposal concerning remanufactured ingredients warrant further consideration to determine whether labels should be required to inform consumers that processed products have been made with remanufactured ingredients. Accordingly, FDA has not established provisions in this final rule to address these products. The agency will complete its evaluation of all available information and will take appropriate action separately from this rulemaking. The agency solicits information on differences in finished products made with remanufactured ingredients from those made with unprocessed ingredients. In particular, FDA requests information on whether such differences occur in finished products other than tomato products, and, if so, whether the differences are significant. Information should be identified with Docket No. 90P–0430 and sent to the Dockets Management Branch (address above). If the agency determines that differences in finished products because of the use of processed ingredients are significant, such differences would form the basis for subsequent rulemaking.

In the interim, FDA advises that it has already established labeling provisions that apply to some foods made from processed ingredients. This final rule, in § 101.95, precludes processed products such as tomato products made using remanufactured ingredients from being described as "fresh." In addition, as discussed in comment 334 of this document, processed products made with fresh ingredients may bear label statements stating that fact. The agency will evaluate labels that are not subject to these provisions on a case-by-case basis to determine if they are false or misleading under section 403(a) of the act because they misrepresent a finished product made with a processed ingredient.

335. Several comments stated that extended shelf life foods do not merit use of the terms "fresh" or "freshly prepared." The comments suggested that extended shelf life foods are preserved using modern preservation techniques and should not be given special consideration over other methods of preservation. A small number of comments expressed the view that pasta products that are packaged in modified atmosphere packaging should be able to utilize the term "fresh" as a way to distinguish these pasta products from dried pasta.

FDA notes that "extended shelf life" is a term used to describe a potentially broad class of products in the marketplace. These products include many types of foods, e.g., vegetables, pasta, complete meals; employ many types of preparation and packaging technologies; and are subject to varying degrees of processing. The use of the term "fresh" on extended shelf life foods is subject to new § 101.95 when such use suggests or implies that the product is unprocessed. However, because of the diversity of products in the extended shelf life category, the question of what constitutes processing for such products is not being addressed in this rule and is subject to a case-by-case review by the agency.

336. Some comments suggested that terms that refer to packaging technology (e.g., "freshness seal," "Stay Fresh seal") would be prohibited under the agency's proposed definition for "fresh." These comments suggested that FDA does not have the authority to

prohibit the use of such terminology as it relates to packaging, specifically in cases where use of these terms are properly qualified. The comments said that such a prohibition would hamper the development of improved packaging technology. Comments also stated that the agency does not have sufficient evidence to suggest that consumers are misled when code dates and freshness guarantees (e.g., guaranteed fresh until) are used on foods. Some comments argued that phrases such as "vacuum packed," "vacuum sealed to lock in freshness," and "for maximum freshness use before a specific date," serve as tools for consumers to distinguish "fresh" product from "stale" product. One comment stressed that vacuum packaging is analogous to blast freezing in that both techniques allow foods to maintain their fresh state.

A small number of comments opposed permitting this use of the term "fresh." Another comment stated that the use of "fresh" in a guarantee statement (e.g., guaranteed fresh) should be restricted and should only be allowed if a food in question meets the definition for "fresh."

The agency has reviewed these comments and has concluded that the use of terms such as "freshness seal," "guaranteed fresh until," "and vacuum packed to preserve freshness," when they relate only to the function of the package and do not imply or suggest that the food itself is unprocessed, is outside the scope of this rulemaking. FDA acknowledges that these terms are used on numerous food products in the marketplace. To the extent that these terms might be used in any manner that is misleading, the agency will review specific situations on a case-by-case basis under the general misbranding provisions of section 403(a) of the act.

B. Natural

Although the use of the term "natural" on the food label is of considerable interest to consumers and industry, FDA's intent was not to establish a definition for "natural" in this rulemaking. However, the agency did note in the general principles proposal (56 FR 60421 at 60466) that, because of the widespread use of this term, and the evidence that consumers regard many uses of this term as noninformative, the agency would consider establishing a definition. Further, the agency stated that it believed that if the term "natural" is adequately defined, the ambiguity in the use of this term, which has resulted in misleading claims, could be abated. Therefore, the agency solicited comments on several issues that the agency must consider in deciding how to address the use of this term on foods, including: (1) Should the agency establish a definition for "natural" so that the term would have a common understanding among consumers, or should "natural" claims be prohibited altogether on the basis that they are false and misleading? (2) If a definition should be established, how should the agency define "natural?" (3) How should the agency proceed in developing a definition for "natural?" (4) Should a food that is represented as "natural" be considered to be misbranded if it has undergone more than minimal processing (and what constitutes minimal processing?), or if it contains any artificial or synthetic ingredients? In addition, FDA asked that identification of "natural" foods accompany the comments. FDA also solicited comments on how the agency distinguishes between artificial and natural flavors in § 101.22, and on how the agency should provide for a clearer, more appropriate distinction between natural and artificial flavors.

337. The comments provided a wide range of ideas for the agency to consider on the issue of developing a definition for "natural." Some comments stated that the term "natural" should be prohibited entirely on the basis that it generates confusion when used on the label or in the labeling of foods, and that the term is also false and misleading. Some comments stated that the agency should eliminate statements such as: "all natural," "100 percent natural," and made from "100 percent natural ingredients." Some comments suggested that the agency should not consider defining "natural" while it is implementing the mandatory requirements of the 1990 amendments.

Other comments suggested that the agency should address the use of the term "natural" in a separate rulemaking.

Some comments suggested that if FDA does establish a definition for the term "natural," it should encompass those foods that do not contain artificial or synthetic ingredients. A few comments stated that processing should not necessarily preclude a product from being deemed "natural." Other comments stated that the term "natural" and claims for natural ingredients should be permitted, provided that the manufacturer uses the term in a truthful, nonmisleading manner. Comments recommended that the use of natural color ingredients should not be precluded in foods that are represented as "natural." One comment suggested that manufacturers should be allowed to make claims for natural ingredients, regardless of any policy established for labeling finished foods as "natural." One comment stated that foods containing refined sugars should be allowed to be represented as "natural," whereas foods containing artificial sweeteners should not be represented as "natural."

None of the comments provided FDA with a specific direction to follow for developing a definition regarding the use of the term "natural." However, it was suggested that FDA should work with USDA to harmonize its definition for "natural."

A small percentage of comments addressed "minimal processing." Some of these comments proposed somewhat similar definitions under which "minimal processing" would refer to those processes that are familiar to consumers and that can be performed in the home (e.g., milling, grinding, baking). One comment suggested that "minimal processing" should include fermentation. Another comment implied that "minimal processing" should include traditional processes such as smoking, roasting, freeze drying, fermenting, and the separation of a product into component parts. The remaining comments defined "minimal processing" as those processes that do not fundamentally alter a raw food or any material derived from the raw food. Finally, some comments stated that FDA's current regulations for labeling natural flavors should not be changed.

After reviewing and considering the comments, the agency continues to believe that if the term "natural" is adequately defined, the ambiguity surrounding use of this term that results in misleading claims could be abated. However, as the comments reflect, there are many facets of this issue that the agency will have to carefully consider if it undertakes a rulemaking to define the term "natural." Because of resource limitations and other agency priorities, FDA is not undertaking rulemaking to establish a definition for "natural" at this time. The agency will maintain its current policy (as discussed in the general principles proposal (56 FR 60421 at 60466)) not to restrict the use of the term "natural" except for added color, synthetic substances, and flavors as provided in § 101.22. Additionally, the agency will maintain its policy (Ref. 32) regarding the use of "natural," as meaning that nothing artificial or synthetic (including all color additives regardless of source) has been included in, or has been added to, a food that would not normally be expected to be in the food. Further, at this time the agency will continue to distinguish between natural and artificial flavors as outlined in § 101.22.

C. Organic

In the general principles proposal (56 FR 60421 at 60467), FDA noted that responsibility for regulating use of the term "organic" was assigned by Congress to USDA in Title XXI—Organic Certification, also known as the "Organic Foods Production Act of 1990." The agency stated that it would defer issuing regulations governing the term "organic" until USDA had adopted appropriate regulations.

338. The majority of the comments addressing the use of "organic" as a food label term agreed with the agency's proposal to defer action until USDA has adopted appropriate regulations governing the term "organic." A small number of comments argued that defining the term "organic" was outside the scope of the 1990 amendments and, therefore, should not be part of this regulation.

However, other comments suggested that FDA should initiate rulemaking on the use of the term "organic" on food labels. Some of these comments suggested that the term "organic" should be applied to foods free of any artificial or synthetic ingredients, pesticides, growth enhancers, harmful fertilizers, or fungicides, and that it should not be applied to foods exposed to ionizing radiation. One comment stated that "organic" should not be allowed as a labeling term because there is no "scientifically acceptable" meaning for this term. Many of the consumer comments proposed that FDA adopt USDA's future definition for "organic" and consider adopting criteria established by the Organic Foods Production Act of 1990.

Most of the comments generally supported the agency's position as expressed in the proposal. Comments that opposed FDA's decision to defer rulemaking did not provide the agency with any justification why it should proceed with rulemaking before USDA has established regulations. Therefore, the agency continues to believe that it is best to defer rulemaking regarding the use of the term "organic" until USDA has adopted appropriate regulations. At that time, FDA will determine whether any regulations governing the term "organic" are necessary.

IX. Conclusions

After review and consideration of the comments received in response to the general principles and fat/cholesterol proposals, FDA concludes that it should amend parts 5 and 101 as set forth in those proposals and in the specific revisions to those proposed regulations discussed in this document. For the purposes of this final rule, certain changes, in addition to those discussed in this document, were made for editorial purposes, clarity, and consistency only. These changes do not amend any matter of substance.

X. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive RIA that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

One particular comment to the RIA stated that the shelf flag highlighting a particular nutrient content of a food in the Giant Foods, Inc./FDA Special Dietary Alert study (SDA) that was used to estimate benefits of the 1990 amendments overestimated the benefits. The comment also noted that shelf flag highlighting may have been used in addition to highlighting the product characteristics on the label such that no similar results could be obtained unless other retailers also used shelf flags. In addition, the comment contended that it is unlikely that retailers will use shelf flags because their use may trigger additional labeling requirements.

The agency notes that these final rules will not prohibit shelf flags from being displayed by manufacturers exactly as they were displayed by Giant Foods, Inc., during the SDA study. The agency is announcing here that it is encouraging retailers to use such devices consistent with the definitions for nutrient content claims provided in this document and the definitions for health claims in the final rule published elsewhere in this issue of the **Federal Register**.

XI. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in the general principles proposal (56 FR 60521) and the fat/cholesterol proposal (56 FR 60478), the agency determined that under 21 CFR 25.24(a)(8) and (a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

Several comments on the proposed rule suggested that there would be significant adverse environmental effects from the final rules unless the agency allowed more time between the publication of the final rules and their effective dates. The concern in these comments was that, if the agency did not allow firms more time between the publication of the final rules and their effective dates to use up existing label inventories, large stocks of labels and labeled packaging would have to be discarded. These comments questioned whether the agency had sufficiently examined the impact of disposing of obsolete labels and labeled packaging on this country's solid waste disposal capabilities. Two comments estimated the amounts of labeling from their respective industries, i.e., dairy and confectionery, that would need to be discarded following publication of FDA's final rules on several food labeling actions, including this action. However, these comments did not: (1) Provide details on how these estimates were derived, (2) identify what portion of the estimated amounts are attributable to these two actions, or (3) describe what impact the discarded labels and packaging would have on the disposal of solid waste. In its November 27, 1991, reproposed rule for mandatory nutrition labeling and proposed rule for

nutrient content claims, the agency proposed that the final rules for these actions would become effective 6 months following their publication in the **Federal Register**.

However, the agency has decided that this final rule will not be effective until May 8, 1994. FDA believes there will thus be ample time for food companies to use up most of the existing labeling and packaging stocks and to incorporate labeling language that complies with FDA's regulations into their food labels. Consequently, the comments on the potential for adverse environmental effects do not affect the agency's previous determination that no significant impact on the human environment is expected and that an environmental impact statement is not required.

XII. Paperwork Reduction Act

In the **Federal Register** of February 14, 1992 (57 FR 5395), FDA announced that the agency had submitted to the Office of Management and Budget (OMB) for its review the collection of information requirements contained in the proposed rule (November 27, 1991, 56 FR 60421) that provided, in part, for petitions regarding nutrient content claims, synonyms for those claims, and implied nutrient content claims in brand names. Also in the February 1992 document, FDA published its estimated annual collection of information burden.

Based on its consideration of the written comments received in response to the aforementioned **Federal Register** documents and the oral presentations made at the public hearing on food labeling, FDA modified the nutrient content claim petition requirements from those that were proposed. Those modifications were discussed in detail earlier in this final rule. Accordingly, FDA has also revised its estimated annual collection of information burden.

This final rule contains collection of information requirements that are subject to review by OMB under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507). Therefore, in accordance with 5 CFR part 1320, the title, description, and respondent descriptions of the collection of information requirements are shown below with an estimate of the annual collection of information burden. Included in the estimate is the amount of time for reviewing instructions, searching existing data sources, gathering necessary information, and completion and submission of petitions.

Title: 21 CFR 101.69—Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms.

Description: This final rule provides the procedures for the submission of petitions to the agency. The information included in these petitions will be reviewed by the agency, and a decision will be made in accordance with the criteria specified in this final rule.

The 1990 amendments added section 403(r)(4) to the act. This section provides that any person may petition the Secretary to make nutrient content claims that are not specifically provided for in FDA's regulations. It describes the procedures for petitions that seek to define additional nutrient content claims, to establish synonyms, and to use an implied nutrient content claim in a brand name.

Nutrient Content Claim petitions—Section 403(r)(4)(A)(i) of the act grants to any person the right to petition FDA to issue a regulation to define a nutrient content claim that has not been defined in the regulations under section 403(r)(2)(A)(i) of the act. The statute requires that such a petition include an explanation of the reasons why the claim that is the subject of the petition meets the requirements of section 403(r) of the act and a summary of the scientific data that support those reasons. Section 101.69(m) sets forth the data requirements specific to descriptor petitions.

Synonym petitions—Section 403(r)(4)(A)(ii) of the act grants the right to petition the FDA for permission to use terms in a nutrient content claim that are consistent (i.e., synonymous) with terms defined in regulations issued under section 403(r)(2)(A)(i) of the act. The petition requirements in § 101.69(n) are those that FDA believes are necessary to demonstrate that use of the proposed synonym is not misleading and is consistent with the purpose of the 1990 amendments.

Brand-name petitions—Section 403(r)(4)(A)(iii) of the act grants the right to petition FDA for permission to use an implied claim in a brand name that is consistent with terms defined by the Secretary under section 403(r)(2)(A)(i) of the act. Section 101.69(o) sets forth the data requirements specific to brand-name petitions. These requirements are, in FDA's opinion, those necessary for the petition to demonstrate that use of the proposed implied claim is not misleading and is consistent with the purpose of the 1990 amendments.

Description of Respondents: Persons and businesses, including small businesses.

Estimated Annual Reporting and Recordkeeping Burden;

Section	Number of Respondents	Number of Responses per Respondent	Total Annual Responses	Average Burden per Response	Annual Burden Hours
101.69(m)	5	1	5	240	1,200
101.69(n)	10	1	10	60	600
101.69(o)	7	1	7	107	749
Total	22	.....	22	.....	2,749

FDA has submitted copies of the final rule to OMB for its review of these reporting requirements.

List of Subjects

21 CFR Part 5

Authority delegations (Government agencies), Imports, Organization and functions (Government agencies).

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 5 and 101 are amended as follows:

PART 5—DELEGATIONS OF AUTHORITY AND ORGANIZATION

1. The authority citation for 21 CFR part 5 continues to read as follows:

Authority: 5 U.S.C. 504, 552, App. 2; 7 U.S.C. 138a, 2271; 15 U.S.C. 638, 1261–1282, 3701–3711a; secs. 2–12 of the Fair Packaging and Labeling Act (15 U.S.C. 1451–1461); 21 U.S.C. 41–50, 61–63, 141–149, 467f, 679(b), 801–886, 1031–1309, secs. 201–903 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321–394); 35 U.S.C. 156; secs. 301, 302, 303, 307, 310, 311, 351, 352, 361, 362, 1701–1706, 2101 of the Public Health Service Act (42 U.S.C. 241, 242, 242a, 242l, 242n, 243, 262, 263, 264, 265, 300u–300u–5, 300aa–1); 42 U.S.C. 1395y, 3246b, 4332, 4831(a), 10007–10008; E.O. 11490, 11921, and 12591.

2. Section 5.61 is amended by revising the section heading and by adding a new paragraph (g) to read as follows:

§ 5.61 Food standards, food additives, generally recognized as safe (GRAS) substances, color additives, nutrient content claims, and health claims.

* * * * *

(g) The Director and Deputy Director, CFSAN are authorized to perform all of the functions of the Commissioner of Food and Drugs under section 403(r)(4) of the act regarding the issuing of decisions to grant or deny, letters of filing, and notices of proposed rulemaking in response to petitions for nutrient content claims and health claims that do not involve controversial issues.

PART 101—FOOD LABELING

3. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

4. Section 101.10 is revised to read as follows:

§ 101.10 Nutrition labeling of restaurant foods.

Nutrition labeling in accordance with § 101.9 shall be provided upon request for any restaurant food or meal for which a nutrient content claim (as defined in § 101.13 or in subpart D of this part) or a health claim (as defined in § 101.14 and permitted by a regulation in subpart E of this part) is made (except on menus). Except: That information on the nutrient amounts that are the basis for the claim (e.g., "low fat," this meal provides less than 10 grams of fat) may serve as the functional equivalent of complete nutrition information as described in § 101.9. Nutrient levels may be determined by nutrient data bases, cookbooks, or analyses or by other reasonable bases that provide assurance that the food or meal meets the nutrient requirements for the claim. Presentation of nutrition labeling may be in various forms, including those provided in § 101.45 and other reasonable means.

5. Section 101.13 is revised to read as follows:

§ 101.13 Nutrient content claims—general principles.

(a) This section and the regulations in subpart D of this part apply to foods that

are intended for human consumption and that are offered for sale.

(b) A claim that expressly or implicitly characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling under § 101.9, with the exception of such claims on restaurant menus, may not be made on the label or in labeling of foods unless the claim is made in accordance with this regulation and with the applicable regulations in subpart D of this part or in part 105 or part 107 of this chapter.

(1) An expressed nutrient content claim is any direct statement about the level (or range) of a nutrient in the food, e.g., "low sodium" or "contains 100 calories."

(2) An implied nutrient content claim is any claim that:

(i) Describes the food or an ingredient therein in a manner that suggests that a nutrient is absent or present in a certain amount (e.g., "high in oat bran"); or

(ii) Suggests that the food, because of its nutrient content, may be useful in maintaining healthy dietary practices and is made in association with an explicit claim or statement about a nutrient (e.g., "healthy, contains 3 grams (g) of fat").

(3) Except for claims regarding vitamins and minerals described in paragraph (q)(3) of this section, no nutrient content claims may be made on food intended specifically for use by infants and children less than 2 years of age unless the claim is specifically provided for in parts 101, 105, or 107 of this chapter.

(c) Information that is required or permitted by § 101.9 to be declared in nutrition labeling, and that appears as part of the nutrition label, is not a nutrient content claim and is not subject to the requirements of this section. If such information is declared elsewhere on the label or in labeling, it is a nutrient content claim and is subject to the requirements for nutrient content claims.

(d) A "substitute" food is one that may be used interchangeably with another food that it resembles, i.e., that it is organoleptically, physically, and functionally (including shelf life) similar to, and that it is not nutritionally inferior to unless it is labeled as an "imitation."

(1) If there is a difference in performance characteristics that materially limits the use of the food, the food may still be considered a substitute if the label includes a disclaimer adjacent to the most prominent claim as defined in paragraph (j)(2)(iii) of this section, informing the consumer of such difference (e.g., "not recommended for frying").

(2) This disclaimer shall be in easily legible print or type and in a size no less than that required by § 101.105(i) for the net quantity of contents statement except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the disclaimer statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth of an inch.

(e)(1) Because the use of a "free" or "low" claim before the name of a food implies that the food differs from other foods of the same type by virtue of its having a lower amount of the nutrient, only foods that have been specially processed, altered, formulated, or reformulated so as to lower the amount of the nutrient in the food, remove the nutrient from the food, or not include the nutrient in the food, may bear such a claim (e.g., "low sodium potato chips").

(2) Any claim for the absence of a nutrient in a food, or that a food is low in a nutrient when the food has not been specially processed, altered, formulated, or reformulated to qualify for that claim shall indicate that the food inherently meets the criteria and shall clearly refer to all foods of that type and not merely to the particular brand to which the labeling attaches (e.g., "corn oil, a sodium-free food").

(f) A nutrient content claim shall be in type size and style no larger than two times that of the statement of identity.

(g) The label or labeling of a food for which a nutrient content claim is made shall contain prominently and in immediate proximity to such claim the following referral statement: "See _____ for nutrition information" with the blank filled in with the identity of the panel on which nutrition labeling is located.

(1) The referral statement "See [*appropriate panel*] for nutrition information" shall be in easily legible boldface print or type, in distinct contrast to other printed or graphic matter, that is no less than that required by § 101.105(i) for net quantity of contents, except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the referral statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth of an inch.

(2) The referral statement shall be immediately adjacent to the nutrient content claim and may have no intervening material other than, if applicable, other information in the statement of identity or any other information that is required to be presented with the claim under this section (e.g., see paragraph (j)(2) of this section) or under a regulation in subpart D of this part (e.g., see §§ 101.54 and 101.62). If the nutrient content claim appears on more than one panel of the label, the referral statement shall be adjacent to the claim on each panel except for the panel that bears the nutrition information where it may be omitted.

(3) If a single panel of a food label or labeling contains multiple nutrient content claims or a single claim repeated several times, a single referral statement may be made. The statement shall be adjacent to the claim that is printed in the largest type on that panel.

(h) In place of the referral statement described in paragraph (g) of this section,

(1) If a food, except a meal product as defined in § 101.13(l), a main dish product as defined in § 101.13(m), or food intended specifically for use by infants and children less than 2 years of age, contains more than 13.0 g of fat, 4.0 g of saturated fat, 60 milligrams (mg) of cholesterol, or 480 mg of sodium per reference amount customarily consumed, per labeled serving, or, for a food with a reference amount customarily consumed of 30 g or less or 2 tablespoons or less, per 50 g (for dehydrated foods that must have water added to them before typical consumption, the per 50 g criterion refers to the "as prepared" form), then that food must disclose, as part of the referral statement, that the nutrient exceeding the specified level is present in the food as follows: "See [*appropriate panel*] for information about [*nutrient requiring disclosure*] and other nutrients," e.g., "See side panel for information about total fat and other nutrients."

(2) If a food is a meal product as defined in § 101.13(l), and contains more than 26 g of fat, 8.0 g of saturated fat, 120 mg of cholesterol, or 960 mg of sodium per labeled serving, then that food must disclose, in accordance with the requirements as provided in paragraph (h)(1) of this section, that the nutrient exceeding the specified level is present in the food.

(3) If a food is a main dish product as defined in § 101.13(m), and contains more than 19.5 g of fat, 6.0 g of saturated fat, 90 mg of cholesterol, or 720 mg of sodium per labeled serving, then that food must disclose, in accordance with the requirements as provided in paragraph (h)(1) of this section, that the nutrient exceeding the specified level is present in the food.

(i) Except as provided in § 101.9 or in paragraph (q)(3) of this section, the label or labeling of a product may contain a statement about the amount or percentage of a nutrient if:

(1) The use of the statement on the food implicitly characterizes the level of the nutrient in the food and is consistent with a definition for a claim, as provided in subpart D of this part, for the nutrient that the label addresses. Such a claim might be, "less than 10 g of fat per serving;"

(2) The use of the statement on the food implicitly characterizes the level of the nutrient in the food and is not consistent with such a definition, but the label carries a disclaimer adjacent to the statement that the food is not low in or a good source of the nutrient, such as "only 200 mg sodium per serving, not a low sodium food." The disclaimer must be in easily legible print or type and in a size no less than required by § 101.105(i) for net quantity of contents except where the size of the claim is less than two times the required size of the net quantity of contents statement, in which case the disclaimer statement shall be no less than one-half the size of the claim but no smaller than one-sixteenth of an inch;

(3) The statement does not in any way implicitly characterize the level of the nutrient in the food and it is not false or misleading in any respect (e.g., "100 calories" or "5 grams of fat"), in which case no disclaimer is required; or

(4) "Percent fat free" claims are not authorized by this paragraph. Such claims shall comply with § 101.62(b)(6).

(j) A food may bear a statement that compares the level of a nutrient in the food with the level of a nutrient in a reference food. These statements shall be known as "relative claims" and include "light," "reduced," "less" (or "fewer"), and "more" claims.

(1) To bear a relative claim about the level of a nutrient, the amount of that nutrient in the food must be compared to an amount of nutrient in an appropriate reference food as specified below.

(i)(A) For "less" (or "fewer") and "more" claims, the reference food may be a dissimilar food within a product category that can generally be substituted for one another in the diet (e.g., potato chips as reference for pretzels) or a similar food (e.g., potato chips as reference for potato chips).

(B) For "light," "reduced," "added," "fortified," and "enriched" claims, the reference food shall be a similar food (potato chip reference for potato chip), and

(ii)(A) For "light" claims, the reference food shall be representative of the type of food that includes the product that bears the claim. The nutrient value for the reference food shall be representative of a broad base of foods of that type; e.g., a value in a representative, valid data base; an average value determined from the top three national (or regional) brands, a market basket norm; or, where its nutrient value is representative of the food type, a market leader. Firms using such a reference nutrient value as a basis for a claim, are required to provide specific information upon which the nutrient value was derived, on request, to consumers and appropriate regulatory officials.

(B) For relative claims other than "light," including "less" and "more" claims, the reference food may be the same as that provided for "light" in paragraph (j)(1)(ii)(A) of this section or it may be the manufacturer's regular product, or that of another manufacturer, that has been offered for sale to the public on a regular basis for a substantial period of time in the same geographic area by the same business entity or by one entitled to use its trade name. The nutrient value(s) for a single manufacturer's product shall be the value declared in nutrition labeling on the product.

(2) For foods bearing relative claims:

(i) The label or labeling must state the identity of the reference food and the percentage (or fraction) of the amount of the nutrient in the reference food by which the nutrient has been modified, (e.g., "50 percent less fat than (reference food)" or "1/3 fewer calories than (reference food)"),

(ii) This information shall be immediately adjacent to the most prominent claim. The type size shall be in accordance with paragraph (g)(1) of this section.

(iii) The determination of which use of the claim is in the most prominent location on the label or labeling will be made based on the following factors, considered in order:

(A) A claim on the principal display panel adjacent to the statement of identity;

(B) A claim elsewhere on the principal display panel;

(C) A claim on the information panel; or

(D) A claim elsewhere on the label or labeling.

(iv) The label or labeling must also bear:

(A) Clear and concise quantitative information comparing the amount of the subject nutrient in the product per labeled serving with that in the reference food; and

(B) This statement shall appear adjacent to the most prominent claim or on the information panel.

(3) A relative claim for decreased levels of a nutrient may not be made on the label or in labeling of a food if the nutrient content of the reference food meets the requirement for a "low" claim for that nutrient (e.g., 3 g fat or less).

(k) The term "modified" may be used in the statement of identity of a food that bears a relative claim that complies with the requirements of this part, followed immediately by the name of the nutrient whose content has been altered (e.g., "Modified fat cheesecake"). This statement of identity must be immediately followed by the comparative statement such as "Contains 35 percent less fat than _____." The label or labeling must also bear the information required by paragraph (j)(2) of this section in the manner prescribed.

(l) For purposes of making a claim, a "meal product shall be defined as a food that:

(1) Makes a major contribution to the total diet by:

(i) Weighing at least 10 ounces (oz) per labeled serving; and

(ii) Containing not less than 40 g for each of at least 3 different foods from 2 or more of the following 4 food groups except as noted in paragraph (l)(1)(ii)(E) of this section:

(A) Bread, cereal, rice, and pasta group;

(B) Fruits and vegetables group;

(C) Milk, yogurt, and cheese group;

(D) Meat, poultry, fish, dry beans, eggs, and nuts group; except that;

(E) These foods shall not be sauces (except for foods in the above four food groups that are in the sauces), gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings or garnishes; and

(2) Is represented as, or is in a form commonly understood to be, a breakfast, lunch, dinner, or meal. Such representations may be made either by statements, photographs, or vignettes.

(m) For purposes of making a claim, a "main dish product" shall be defined as a food that:

(1) Makes a major contribution to a meal by

(i) Weighing at least 6 oz per labeled serving; and

(ii) Containing not less than 40 g for each of at least two different foods from two of the following four food groups except as noted in paragraph (l)(1)(ii)(E) of this section:

(A) Bread, cereal, rice, and pasta group;

(B) Fruits and vegetables group;

(C) Milk, yogurt, and cheese group;

(D) Meat, poultry, fish, dry beans, eggs, and nuts groups; except that:

(E) These foods shall not be sauces (except for foods in the above four food groups that are in the sauces) gravies, condiments, relishes, pickles, olives, jams, jellies, syrups, breadings, or garnishes; and

(2) Is represented as, or is in a form commonly understood to be, a main dish (e.g, not a beverage or a dessert). Such representations may be made either by statements, photographs, or vignettes.

(n) Nutrition labeling in accordance with § 101.9 or § 101.10, as applicable shall be provided for any food for which a nutrient content claim is made.

(o) Except as provided in § 101.10, compliance with requirements for nutrient content claims in this section and in the regulations in subpart D of this part, will be determined using the analytical methodology prescribed for determining compliance with nutrition labeling in § 101.9.

(p)(1) Unless otherwise specified the reference amount customarily consumed set forth in § 101.12(b) through (f) shall be used in determining whether a product meets the criteria for a nutrient content claim. If the serving size declared on the product label differs from the reference amount customarily consumed, and the amount of the nutrient contained in the labeled serving does not meet the maximum or minimum amount criterion in the definition for the descriptor for that nutrient, the claim shall be followed by the criteria for the claim as required by § 101.12(g) (e.g., "very low sodium, 35 mg or less per 240 milliliters (8 fl oz.)").

(2) The criteria for the claim shall be immediately adjacent to the most prominent claim in easily legible print or type and in a size in accordance with paragraph (g)(1) of this section.

(q) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that are contained in the brand name of a specific food product that was the brand name in use on such food before October 25, 1989, may continue to be used as part of that brand name for such product, provided that they are not false or misleading under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act). However, foods bearing such claims must comply with section 403(f), (g), and (h) of the act;

(2) A soft drink that used the term "diet" as part of its brand name before October 25, 1989, and whose use of that term was in compliance with § 105.66 of this chapter as that regulation appeared in the Code of Federal Regulations on that date, may continue to use that term as part of its brand name, provided that its use of the term is not false or misleading under section 403(a) of the act. Soft drinks marketed after October 25, 1989, may use the term "diet" provided they are in compliance with the current § 105.66 of this chapter;

(3) A statement that describes the percentage of a vitamin or mineral in the food, including foods intended specifically for use by infants and children less than 2 years of age, in relation to a Reference Daily Intake (RDI) as defined in § 101.9 may be made on the label or in labeling of a food without a regulation authorizing such a claim for a specific vitamin or mineral unless such claim is expressly prohibited by regulation under section 403(r)(2)(A)(vi) of the act.

(4) The requirements of this section do not apply to:

(i) Infant formulas subject to section 412(h) of the act; and

(ii) Medical foods defined by section 5(b) of the Orphan Drug Act.

(5) A nutrient content claim used on food that is served in restaurants (except on menus) or other establishments in which food is served for immediate human consumption or which is sold for sale or use in such establishments shall comply with the requirements of this section and the appropriate definition in subpart D of this part, except that:

(i) Such claim is exempt from the requirements for disclosure statements in paragraphs (g) and (h) of this section and §§ 101.54(d), 101.62(c), (d)(1)(ii)(C), (d)(2)(ii)(C), (d)(3), (d)(4)(ii)(C), and (d)(5)(ii)(C); and

(ii) In lieu of analytical testing, compliance may be determined using a reasonable basis for concluding that the food that bears the claim meets the definition for the claim. This reasonable basis may derive from recognized data bases for raw and processed foods, recipes, and other means to compute nutrient levels in the foods or meals and may be used provided reasonable steps are taken to ensure that the method of preparation adheres to the factors on which the reasonable basis was determined (e.g., types and amounts of ingredients, cooking temperatures, etc.). Firms making claims on foods based on this reasonable basis criterion are required to provide to appropriate regulatory officials on request the specific information on which their determination is based and reasonable assurance of operational adherence to the preparation methods or other basis for the claim; and

(iii) A term or symbol that may in some contexts constitute a claim under this section may be used, provided that the use of the term or symbol does not characterize the level of a nutrient, and a statement that clearly explains the basis for the use of the term or symbol is prominently displayed and does not characterize the level of a nutrient. For example, a term such as "lite fare" followed by an asterisk referring to a note that makes clear that in this restaurant "lite fare" means smaller portion sizes than normal; or an item bearing a symbol referring to a note that makes clear that this item meets the criteria for the dietary guidance established by a recognized dietary authority would not be considered a nutrient content claim under § 101.13.

(6) Nutrient content claims that were part of the common or usual names of foods that were subject to a standard of identity on November 8, 1990, are not subject to the requirements of paragraphs (b), (g), and (h) of this section or to definitions in subpart D of this part.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by the Food and Drug Administration. Petitions requesting approval of such a claim may be submitted under § 101.69(o).

(8) The term "fluoridated," "fluoride added" or "with added fluoride" may be used on the label or in labeling of bottled water that contains added fluoride.

§ 101.25 [Removed]

6. Section 101.25 *Labeling of foods in relation to fat and fatty acid and cholesterol content* is removed from subpart B.

7. New subpart D, consisting of §§ 101.54 through 101.69, is added to read as follows:

Subpart D—Specific Requirements for Nutrient Content Claims

Sec.

Subpart D—Specific Requirements for Nutrient Content Claims

§ 101.54 Nutrient content claims for "good source," "high," and "more."

(a) *General requirements.* Except as provided in paragraph (e) of this section, a claim about the level of a nutrient in a food in relation to the Reference Daily Intake (RDI) established for that nutrient in § 101.9(c)(8)(iv) or Daily Reference Value (DRV) established for that nutrient in § 101.9(c)(9), (excluding total carbohydrates) may only be made on the label and in labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food for which the claim is made is labeled in accordance with § 101.9 or § 101.10, where applicable.

(b) *"High" claims.* (1) The terms "high," "rich in," or "excellent source of" may be used on the label and in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that the food contains 20 percent or more of the RDI or the DRV per reference amount customarily consumed.

(2) The terms defined in paragraph (b)(1) of this section may be used on the label and in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The product contains a food that meets the definition of "high" in paragraph (b)(1) of this section; and

(ii) The label or labeling clearly identifies the food that is the subject of the claim (e.g., the serving of broccoli in this product is high in vitamin C).

(c) *"Good Source" claims.* (1) The terms "good source," "contains," or "provides" may be used on the label or in the labeling of foods, except meal products as described in § 101.13(l) and a main dish product as defined in § 101.13(m), provided that the food contains 10 to 19 percent of the RDI or the DRV per reference amount customarily consumed.

(2) The terms defined in paragraph (c)(1) of this section may be used on the label and in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in 101.13(m), provided that:

(i) The product contains a food that meets the definition of "good source" in paragraph (c)(1) of this section; and

(ii) The label or labeling clearly identifies the food that is the subject of the claim (e.g., the serving of sweet potatoes in this product is a "good source" of fiber).

(d) *"Fiber" claims.* (1) If a nutrient content claim is made with respect to the level of dietary fiber, that is, that the product is high in fiber, a good source of fiber, or that the food contains "more" fiber, and the food is not "low" in total fat as defined in § 101.62(b)(2) or, in the case of a meal product, as defined in § 101.13(l), or main dish product, as defined in § 101.13(m), is not "low" in total fat as defined in § 101.62(b)(3), then the label shall disclose the level of total fat per labeled serving.

(2) The disclosure shall appear in immediate proximity to such claim, be in a type size no less than one-half the size of the claim and precede the referral statement required in § 101.13(g) (e.g., "contains [*x amount*] of total fat per serving. See [*appropriate panel*] for nutrition information").

(e) *"More claims."* (1) A relative claim using the terms "more," "fortified," "enriched," and "added" may be used on the label or in labeling to describe the level of protein, vitamins, minerals, dietary fiber, or potassium in a food, except as limited by § 101.13(j)(1)(i) and except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or potassium (expressed as a percent of the Daily Value) per reference amount customarily consumed than an appropriate reference food; and

(ii) Where the claim is based on a nutrient that has been added to the food, that fortification is in accordance with the policy on fortification of foods in § 104.20 of this chapter; and

(iii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percentage (or fraction) that the nutrient was increased relative to the RDI or DRV are declared in immediate proximity to the most prominent such claim (e.g., "contains 10 percent more of the Daily Value for fiber than white bread"); and

(B) Quantitative information comparing the level of the nutrient in the product per labeled serving, with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "Fiber content of white bread is 1 gram (g) per serving; (this product) 3.5 g per serving").

(2) A relative claim using the terms "more," "fortified," "enriched," and "added" may be used on the label or in labeling to describe the level of protein, vitamins, minerals, dietary fiber or potassium, except as limited in § 101.13(j)(1)(i), in meal products as defined in § 101.13(l) or main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or potassium (expressed as a percent of the Daily Value) per 100 g of food than an appropriate reference food.

(ii) Where the claim is based on a nutrient that has been added to the food, that fortification is in accordance with the policy on fortification of foods in § 104.20 of this chapter; and

(iii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percentage (or fraction) that the nutrient was increased relative to the RDI or DRV are declared in immediate proximity to the most prominent such claim (e.g., "contains 10 percent more of the Daily Value for fiber per 3 oz than does 'X brand of product'"), and

(B) Quantitative information comparing the level of the nutrient in the product per specified weight, with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "the fiber content of 'X brand of product' is 2 g per 3 oz. This product contains 4.5 g per 3 oz").

§ 101.56 Nutrient content claims for "light" or "lite."

(a) *General requirements.* A claim using the term "light" or "lite" to describe a food may only be made on the label and in labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food is labeled in accordance with § 101.9, § 101.10, or § 101.36, where applicable.

(b) *"Light" claims.* The terms "light" or "lite" may be used on the label or in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), without further qualification, provided that:

(1) If the food derives 50 percent or more of its calories from fat, its fat content is reduced by 50 percent or more per reference amount customarily consumed compared to an appropriate reference food as specified in § 101.13(j)(1); or

(2) If the food derives less than 50 percent of its calories from fat:

(i) The number of calories is reduced by at least one-third (33 1/3 percent) per reference amount customarily consumed compared to an appropriate reference food; or

(ii) Its fat content is reduced by 50 percent or more per reference amount customarily consumed compared to the reference food that it resembles or for which it substitutes as specified in § 101.13(j)(1); and

(3) As required in § 101.13(j)(2) for relative claims:

(i) The identity of the reference food and the percent (or fraction) that the calories and the fat were reduced are declared in immediate proximity to the most prominent such claim, (e.g., "1/3 fewer calories and 50 percent less fat than our regular cheese cake");

(ii) Quantitative information comparing the level of calories and fat content in the product per labeled serving size, with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., lite cheese cake—200 calories, 4 grams (g) fat; regular cheese cake—300 calories, 8 g fat per serving); and

(iii) If the labeled food contains less than 40 calories or less than 3 g fat per reference amount customarily consumed, the percentage reduction for that nutrient need not be declared.

(4) A "light" claim may not be made on a food for which the reference food meets the definition of "low fat" and "low calorie."

(c)(1)(i) A product for which the reference food contains 40 calories or less and 3 g fat or less per reference amount customarily consumed may use the term "light" or "lite" without further qualification if it is reduced by 50 percent or more in sodium content compared to the reference food; and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sodium was reduced shall be declared in immediate proximity to the most prominent such claim (e.g., 50 percent less sodium than our regular soy sauce); and

(B) Quantitative information comparing the level of sodium per labeled serving size with that of the reference food it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "lite soy sauce 500 milligrams (mg) sodium per serving, regular soy sauce 1,000 mg per serving").

(2)(i) A product for which the reference food contains more than 40 calories or more than 3 g fat per reference amount customarily consumed may use the term "light in sodium" or "lite in sodium" if it is reduced by 50 percent or more in sodium content compared to the reference food, provided that "light" or "lite" is presented in immediate proximity with "in sodium" and the entire term is presented in uniform type size, style, color, and prominence; and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sodium was reduced shall be declared in immediate proximity to the most prominent such claim (e.g., 50 percent less sodium than our regular canned peas); and

(B) Quantitative information comparing the level of sodium per labeled serving size with that of the reference food it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "light canned peas, 175 milligrams (mg) sodium per serving, regular canned peas 350 mg per serving.")

(iii) Except for meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), a "light in sodium" claim may not be made on a food for which the reference food meets the definition of "low in sodium".

(d)(1) The terms "light" or "lite" may be used on the label or in the labeling of a meal product as defined in § 101.13(l) and a main dish product as defined in § 101.13(m), provided that:

(i) The food meets the definition of:

(A) "Low in calories" as defined in § 101.60(b)(3); or

(B) "Low in fat" as defined in § 101.62(b)(3); and

(ii)(A) A statement appears on the principal display panel that explains whether "light" is used to mean "low fat," "low calories," or both (e.g., "Light Delight, a low fat meal"); and

(B) The accompanying statement is no less than one-half the type size of the "light" or "lite" claim.

(d)(2)(i) The term "light in sodium" or "lite in sodium" may be used on the label or in the labeling of a meal product as defined in § 101.13(l) and a main dish product as defined in § 101.13(m), provided that the food meets the definition of "low in sodium" as defined in § 101.61(b)(5)(i); and

(ii) "Light" or "lite" and "in sodium" are presented in uniform type size, style, color, and prominence.

(e) Except as provided in paragraphs (b) through (d) of this section, the term "light" or "lite" may not be used to refer to a food that is not reduced in fat by 50 percent, or, if applicable, in calories by 1/3 or, when properly qualified, in sodium by 50 percent unless:

(1) It describes some physical or organoleptic attribute of the food such as texture or color and the information (e.g., "light in color" or "light in texture") so stated, clearly conveys the nature of the product; and

(2) The attribute (e.g., "color" or "texture") is in the same style, color, and at least one-half the type size as the word "light" and in immediate proximity thereto.

(f) If a manufacturer can demonstrate that the word "light" has been associated, through common use, with a particular food to reflect a physical or organoleptic attribute (e.g., light brown sugar, light corn syrup, or light molasses) to the point where it has become part of the statement of identity, such use of the term "light" shall not be considered a nutrient content claim subject to the requirements in this part.

(g) The term "lightly salted" may be used on a product to which has been added 50 percent less sodium than is normally added to the reference food as described in § 101.13(j)(1)(i)(B) and (j)(1)(ii)(B), provided that if the product is not "low in sodium" as defined in § 101.61(b)(4), the statement "not a low sodium food," shall appear on the information panel and the information on the label or labeling as specified in § 101.13(j)(2).

§ 101.60 Nutrient content claims for the calorie content of foods.

(a) *General requirements.* A claim about the calorie content of a food may only be made on the label or in the labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food for which the claim is made is labeled in accordance with § 101.9 or § 101.10, where applicable.

(b) *"Calorie content claims."* (1) The terms "calorie free," "free of calories," "no calories," "zero calories," "without calories," "trivial source of calories," "negligible source of calories," or "dietarily insignificant source of calories" may be used on the label or in the labeling of foods, provided that:

(i) The food contains less than 5 calories per reference amount customarily consumed; and

(ii) As required in § 101.13(e)(2), if the food meets this condition without the benefit of special processing, alteration, formulation, or reformulation to lower the caloric content, it is labeled to

disclose that calories are not usually present in the food (e.g., "cider vinegar, a calorie free food").

(2) The terms "low calorie," "few calories," "contains a small amount of calories," "low source of calories," or "low in calories" may be used on the label and in labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food has a reference amount customarily consumed greater than 30 grams (g) or greater than 2 tablespoons and does not provide more than 40 calories per reference amount customarily consumed; or

(ii) The food has a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and does not provide more than 40 calories per reference amount customarily consumed and, except for sugar substitutes, per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g criterion refers to the "as prepared" form); and

(iii) If a food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to vary the caloric content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches (e.g., "celery, a low calorie food").

(3) The terms defined in paragraph (b)(2) of this section may be used on the label or in labeling of meal products as defined in § 101.13(l) or main dish products as defined in § 101.13(m), provided that:

(i) The product contains 120 calories or less per 100 g; and

(ii) If the product meets this condition without the benefit of special processing, alteration, formulation, or reformulation to lower the calorie content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which it attaches.

(4) The terms "reduced calorie," "reduced in calories," "calorie reduced," "fewer calories," "lower calorie," or "lower in calories" may be used on the label or in the labeling of foods, except as limited by § 101.13(j)(1)(i) and except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent fewer calories per reference amount customarily consumed than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the calories have been reduced are declared in immediate proximity to the most prominent such claim (e.g., reduced calorie cupcakes "33 1/3 percent fewer calories than regular cupcakes"); and

(B) Quantitative information comparing the level of the nutrient in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "calorie content has been reduced from 150 to 100 calories per serving").

(iii) Claims described in paragraph (b)(4) of this section may not be made on the label or labeling of foods if the reference food meets the definition for "low calorie."

(5) The terms defined in paragraph (b)(4) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent fewer calories per 100 g of food than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the calories have been reduced are declared in immediate proximity to the most prominent such claim (e.g., Larry's Reduced Calorie Lasagna, "25 percent fewer calories per oz (or 3 oz) than our regular Lasagna"); and

(B) Quantitative information comparing the level of the nutrient in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., calorie content has been reduced from 108 calories per 3 oz to 83 calories per 3 oz).

(iii) Claims described in paragraph (b)(5) of this section may not be made on the label or labeling of food if the reference food meets the definition for "low calorie."

(c) *Sugar content claims*—(1) *Use of terms such as "sugar free," "free of sugar," "no sugar," "zero sugar," "without sugar," "sugarless," "trivial source of sugar," "negligible source of sugar," or "dietarily insignificant source of sugar."* Consumers may reasonably be expected to regard terms that represent that the food contains no sugars or sweeteners e.g., "sugar free," or "no sugar," as indicating a product which is low in calories or significantly reduced in calories. Consequently, except as provided in paragraph (c)(2) of this section, a food may not be labeled with such terms unless:

(i) The food contains less than 0.5 g of sugars, as defined in § 101.9(c)(6)(ii), per reference amount customarily consumed or in the case of a meal product or main dish product less than 0.5 g of sugars per labeled serving; and

(ii) The food contains no ingredient that is a sugar or that is generally understood by consumers to contain sugars unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients, which states "adds a trivial amount of sugar," "adds a negligible amount of sugar," or "adds a dietarily insignificant amount of sugar;" and

(iii)(A) It is labeled "low calorie" or "reduced calorie" or bears a relative claim of special dietary usefulness labeled in compliance with paragraphs (b)(2), (b)(3), (b)(4), or (b)(5) of this section; or

(B) Such term is immediately accompanied, each time it is used, by either the statement "not a reduced calorie food," "not a low calorie food," or "not for weight control."

(2) The terms "no added sugar," "without added sugar," or "no sugar added" may be used only if:

(i) No amount of sugars, as defined in § 101.9(c)(6)(ii), or any other ingredient that contains sugars that functionally substitute for added sugars is added during processing or packaging; and

(ii) The product does not contain an ingredient containing added sugars such as jam, jelly, or concentrated fruit juice; and

(iii) The sugars content has not been increased above the amount present in the ingredients by some means such as the use of enzymes, except where the intended functional effect of the process is not to increase the sugars content of a food, and a functionally insignificant increase in sugars results; and

(iv) The food that it resembles and for which it substitutes normally contains added sugars; and

(v) The product bears a statement that the food is not "low calorie" or "calorie reduced" (unless the food meets the requirements for a "low" or "reduced calorie" food) and that directs consumers' attention to the nutrition panel for further information on sugar and calorie content.

(3) Paragraph (c)(1) of this section shall not apply to a factual statement that a food, including foods intended specifically for infants and children less than 2 years of age, is unsweetened or contains no added sweeteners in the

case of a food that contains apparent substantial inherent sugar content, e.g., juices.

(4) The terms "reduced sugar," "reduced in sugar," "sugar reduced," "less sugar," "lower sugar" or "lower in sugar" may be used on the label or in labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less sugar per reference amount customarily consumed than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sugar has been reduced are declared in immediate proximity to the most prominent such claim (e.g., "these corn flakes contain 25 percent less sugar than our sugar coated corn flakes"); and

(B) Quantitative information comparing the level of the sugar in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "Sugar content has been lowered from 8 g to 6 g per serving").

(5) The terms defined in paragraph (c)(4) of this section may be used on the label or in the labeling of a meal product as defined in § 101.13(l) and a main dish product as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less sugars per 100 g of food than an appropriate reference food as described in § 101.13(j)(1), and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sugars have been reduced are declared in immediate proximity to the most prominent such claim (e.g., reduced sweet and sour shrimp dinner, "25 percent less sugar per 3 oz than our regular sweet and sour shrimp dinner"); and

(B) Quantitative information comparing the level of the nutrient in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., sugar content has been reduced from 17 g per 3 oz to 13 g per 3 oz).

§ 101.61 Nutrient content claims for the sodium content of foods.

(a) *General requirements.* A claim about the level of sodium in a food may only be made on the label and in the labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food for which the claim is made is labeled in accordance with § 101.9 or § 101.10, where applicable.

(b) *"Sodium content claims."* (1) The terms "sodium free," "free of sodium," "no sodium," "zero sodium," "without sodium," "trivial source of sodium," "negligible source of sodium," or "dietary insignificant source of sodium" may be used on the label or in the labeling of foods, provided that:

(i) The food contains less than 5 milligrams (mg) of sodium per reference amount customarily consumed or in the case of a meal product or a main dish product less than 5 mg of sodium per labeled serving; and

(ii) The food contains no ingredient that is sodium chloride or is generally understood by consumers to contain sodium, unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients, which states: "Adds a trivial amount of sodium," "adds a negligible amount of sodium" or "adds a dietarily insignificant amount of sodium;" and

(iii) As required in § 101.13(e)(2) if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower the sodium content, it is labeled to disclose that sodium is not usually present in the food (e.g., "leaf lettuce, a sodium free food").

(2) The terms "very low sodium," or "very low in sodium," may be used on the label and in labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i)(A) The food has a reference amount customarily consumed greater than 30 grams (g) or greater than 2 tablespoons and contains 35 mg or less sodium per reference amount customarily consumed; or

(B) The food has a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and contains 35 mg or less sodium per reference amount customarily consumed and per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g refers to the "as prepared" form);

(ii) If the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to vary the sodium content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches (e.g., "potatoes, a very low-sodium food").

(3) The terms defined in paragraph (b)(2) of this section may be used on the label and in labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The product contains 35 mg or less of sodium per 100 g of product; and

(ii) If the product meets this condition without the benefit of special processing, alteration, formulation, or reformulation to lower the sodium content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(4) The terms "low sodium," or "low in sodium," "little sodium," "contains a small amount of sodium," or "low source of sodium" may be used on the label and in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i)(A) The food has a reference amount customarily consumed greater than 30 g or greater than 2 tablespoons and contains 140 mg or less sodium per reference amount customarily consumed; or

(B) The food has a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and contains 140 mg or less sodium per reference amount customarily consumed and per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g criterion refers to the "as prepared" form); and

(ii) If the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to vary the sodium content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches (e.g., "fresh spinach, a low sodium food"); and

(5) The terms defined in paragraph (b)(4) of this section may be used on the label and in labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The product contains 140 mg or less sodium per 100 g; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower the sodium content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(6) The terms "reduced sodium," "reduced in sodium," "sodium reduced," "less sodium," "lower sodium," or "lower in sodium" may be used on the label or in labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less sodium per reference amount customarily consumed than an appropriate reference food as described in § 101.13(j)(1).

(ii) As required for § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sodium has been reduced are declared in immediate proximity to the most prominent such claim (e.g., "reduced sodium ————, 50 percent less sodium than regular ————"); and

(B) Quantitative information comparing the level of the sodium in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "sodium content has been lowered from 300 to 150 mg per serving").

(iii) Claims described in paragraph (b)(6) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low sodium."

(7) The terms defined in paragraph (b)(6) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less sodium per 100 g of food than an appropriate reference food as described in § 101.13(j)(1), and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the sodium has been reduced are declared in immediate proximity to the most prominent such claim (e.g., reduced sodium eggplant parmigiana dinner "30 percent less sodium per oz (or 3 oz) than our regular eggplant parmigiana dinner").

(B) Quantitative information comparing the level of sodium in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., sodium content has been reduced from 217 mg per 3 oz to 150 mg per 3 oz).

(iii) Claims described in paragraph (b)(7) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low sodium."

(c) The term "salt" is not synonymous with "sodium." Salt refers to sodium chloride. However, references to salt content such as "unsalted," "no salt," "no salt added" are potentially misleading.

(1) The term "salt free" may be used on the label or in labeling of foods only if the food is "sodium free" as defined in paragraph (b)(1) of this section.

(2) The terms "unsalted," "without added salt," and "no salt added" may be used on the label or in labeling of foods only if:

(i) No salt is added during processing;

(ii) The food that it resembles and for which it substitutes is normally processed with salt; and

(iii) If the food is not sodium free, the statement, "not a sodium free food" or "not for control of sodium in the diet" appears on the information panel of the food bearing the claim.

(3) Paragraph (c)(2) of this section shall not apply to a factual statement that a food intended specifically for infants and children less than 2 years of age is unsalted, provided such statement refers to the taste of the food and is not otherwise false and misleading.

§ 101.62 Nutrient content claims for fat, fatty acid, and cholesterol content of foods.

(a) *General requirements.* A claim about the level of fat, fatty acid, and cholesterol in a food may only be made on the label or in the labeling of foods if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food for which the claim is made is labeled in accordance with § 101.9 or § 101.10, where applicable.

(b) *"Fat content claims."* (1) The terms "fat free," "free of fat," "no fat," "zero fat," "without fat," "nonfat," "trivial source of fat," "negligible source of fat," or "dietarily insignificant source of fat" may be used on the label or in labeling of foods, provided that:

(i) The food contains less than 0.5 gram (g) of fat per reference amount customarily consumed or in the case of a meal product or main dish product less than 0.5 g of fat per labeled serving;

(ii) The food contains no added ingredient that is a fat or is generally understood by consumers to contain fat unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients, which states "adds a trivial amount of fat," "adds a negligible amount of fat," or "adds a dietarily insignificant amount of fat;" and

(iii) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to disclose that fat is not usually present in the food (e.g., "broccoli, a fat free food").

(2) The terms "low fat," "low in fat," "contains a small amount of fat," "low source of fat," or "little fat" may be used on the label and in labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i)(A) The food has a reference amount customarily consumed greater than 30 g or greater than 2 tablespoons and contains 3 g or less of fat per reference amount customarily consumed; or

(B) The food has a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and contains 3 g or less of fat per reference amount customarily consumed and per 50 g of food (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g criterion refers to the "as prepared" form); and

(ii) If the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches (e.g., "frozen perch, a low fat food").

(3) The terms defined in paragraph (b)(2) of this section may be used on the label and in labeling of meal products as defined in § 101.13(l) or main dish products as defined in § 101.13(m), provided that:

(i) The product contains 3 g or less of total fat per 100 g and not more than 30 percent of calories from fat; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(4) The terms "reduced fat," "reduced in fat," "fat reduced," "less fat," "lower fat," or "lower in fat" may be used on the label or in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less fat per reference amount customarily consumed than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the fat has been reduced and are declared in immediate proximity to the most prominent such claim (e.g., "reduced fat—50 percent less fat than our regular brownies"); and

(B) Quantitative information comparing the level of fat in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "fat content has been reduced from 8 g to 4 g per serving").

(iii) Claims described in paragraph (b)(4) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low fat."

(5) The terms defined in paragraph (b)(4) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less fat per 100 g of food than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the fat has been reduced are declared in immediate proximity to the most prominent such claim (e.g., reduced fat spinach souffle, "33 percent less fat per 3 oz than our regular spinach souffle"); and

(B) Quantitative information comparing the level of fat in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent such claim or on the information panel (e.g., fat content has been reduced from 7.5 g per 3 oz to 5 g per 3 oz).

(iii) Claims described in paragraph (b)(5) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low fat."

(6) The term "——— percent fat free" may be used on the label or in the labeling of foods, provided that:

(i) The food meets the criteria for "low fat" in paragraph (b)(2) or (b)(3) of this section;

(ii) The percent of reduction and the words "fat free" are in uniform type size; and

(iii) A "100 percent fat free" claim may be made only on foods that meet the criteria for "fat free" in paragraph (b)(1) of this section, that contain less than 0.5 g of fat per 100 g, and that contain no added fat.

(c) *"Fatty acid content claims."* The label or labeling of foods that bear claims with respect to the level of saturated fat shall disclose the level of total fat and cholesterol in the food in immediate proximity to such claim each time the claim is made and in type that shall be no less than one-half the size of the type used for the claim with respect to the level of saturated fat. Declaration of cholesterol content may be omitted when the food contains less than 2 milligrams (mg) of cholesterol per reference amount customarily consumed or in the case of a meal or main dish product less than 2 mg of cholesterol per labeled serving. Declaration of total fat may be omitted with the term defined in paragraph (c)(1) of this section when the food contains 0.5 g or less of total fat per reference amount customarily consumed or, in the case of a meal product or a main dish product, when the product contains less than 0.5 g of total fat per labeled serving. The declaration of total fat may be omitted with the terms defined in paragraphs (c)(2) through (c)(5) of this section when the food contains 3 g or less of total fat per reference amount customarily consumed or in the case of a meal product or a main dish product, when the product contains 3 g or less of total fat per 100 g and not more than 30 percent calories from fat.

(1) The terms "saturated fat free," "free of saturated fat," "no saturated fat," "zero saturated fat," "without saturated fat," "trivial source of saturated fat," "negligible source of saturated fat," or "dietarily insignificant source of saturated fat" may be used on the label or in the labeling of foods, provided that:

(i) The food contains less than 0.5 g of saturated fat per reference amount customarily consumed and the level of trans fatty acids does not exceed 1 percent of the total fat, or in the case of a meal product or main dish product, less than 0.5 g of saturated fat per labeled serving and the level of trans fatty acids does not exceed 1 percent of the total fat; and

(ii) The food contains no ingredient that is generally understood by consumers to contain saturated fat unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients which states, "adds a trivial amount of saturated fat," "adds a negligible amount of saturated fat," or "adds a dietarily insignificant amount of saturated fat;" and

(iii) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower saturated fat content, it is labeled to disclose that saturated fat is not usually present in the food.

(2) The terms "low in saturated fat," "low saturated fat," "contains a small amount of saturated fat," "low source of saturated fat," or "a little saturated fat" may be used on the label or in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains 1 g or less of saturated fatty acids per reference amount customarily consumed and not more than 15 percent of calories from saturated fatty acids; and

(ii) If a food meets these conditions without benefit of special processing, alteration, formulation, or reformulation to lower saturated fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches (e.g., "raspberries, a low saturated fat food").

(3) The terms defined in paragraph (c)(2) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The product contains 1 g or less of saturated fatty acids per 100 g and less than 10 percent calories from saturated fat; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower saturated fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(4) The terms "reduced saturated fat," "reduced in saturated fat," "saturated fat reduced," "less saturated fat," "lower saturated fat," or "lower in saturated fat" may be used on the label or in the labeling of foods, except as limited by § 101.13(j)(1)(i)(A) and except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less saturated fat per reference amount customarily consumed than an appropriate reference food as described in § 101.13(j)(1); and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food and the percent (or fraction) that the saturated fat was reduced are declared in immediate proximity to the most prominent such claim (e.g., "reduced

saturated fat. Contains 50 percent less saturated fat than the national average for nondairy creamers"); and

(B) Quantitative information comparing the level of saturated fat in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "saturated fat reduced from 3 g to 1.5 g per serving").

(iii) Claims described in paragraph (c)(4) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low saturated fat."

(5) The terms defined in paragraph (c)(4) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) The food contains at least 25 percent less saturated fat per 100 g of food than an appropriate reference food as described in § 101.13(j)(1), and

(ii) As required in § 101.13(j)(2) for relative claims:

(A) The identity of the reference food, and the percent (or fraction) that the fat has been reduced are declared in immediate proximity to the most prominent such claim (e.g., reduced saturated fat Macaroni and Cheese, "33 percent less saturated fat per 3 oz than our regular Macaroni and Cheese").

(B) Quantitative information comparing the level of saturated fat in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., saturated fat content has been reduced from 2.5 g per 3 oz to 1.7 g per 3 oz).

(iii) Claims described in paragraph (c)(5) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low saturated fat."

(d) *"Cholesterol content claims."* (1) The terms "cholesterol free," "free of cholesterol," "zero cholesterol," "without cholesterol," "no cholesterol," "trivial source of cholesterol," "negligible source of cholesterol," or "dietarily insignificant source of cholesterol" may be used on the label or in the labeling of foods, provided that:

(i) For foods that contain 13 g or less of total fat per reference amount cutomarily consumed, per labeled serving, and per 50 g if the reference amount customarily consumed is 30 g or less or 2 tablespoons or less (for dehydrated foods that must have water added to them prior to typical consumption, the per 50-g criterion refers to the "as prepared form"), or, in the case of meal products, 26.0 g or less total fat per labeled serving, or, in the case of main dish products, 19.5 g or less total fat per labeled serving:

(A) The food contains less than 2 mg of cholesterol per reference amount customarily consumed or in the case of a meal product or main dish product less than 2 mg of cholesterol per labeled serving; and

(B) The food contains no ingredient that is generally understood by consumers to contain cholesterol, unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients, which states "adds a trivial amount of cholesterol," "adds a negligible amount of cholesterol," or "adds a dietarily insignificant amount of cholesterol;" and

(C) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed or, in the case of a meal product or main dish product, 2 g or less of saturated fatty acids per labeled serving; and

(D) As required in § 101.13(e)(2), if the food contains less than 2 mg of cholesterol per reference amount customarily consumed or in the case of a meal product or main dish product, less than 2 mg of cholesterol per labeled serving without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the food (e.g., "applesauce, a cholesterol-free food").

(ii) For food that contain more than 13 g of total fat per reference amount customarily consumed, per labeling serving, per 50 g if the reference amount customarily consumed is 30 g or less or 2 tablespoons or less (for dehydrated foods that must have water added to them prior to typical consumption, the per 50-g criterion refers to the "as prepared" form), or in the case of a meal product, more than 26 g of total fat per labeled serving, or, in the case of a main dish product more than 19.5 g of total fat per labeled serving:

(A) The food contains less than 2 mg of cholesterol per reference amount cutomarily consumed or, in the case of a meal product or main dish product, less than 2 mg of cholesterol per labeled serving; and

(B) The food contains no ingredient that is generally understood by consumers to contain cholesterol, unless the listing of the ingredient in the ingredient statement is followed by an asterisk that refers to the statement below the list of ingredients, which states "adds a trivial amount of cholesterol," "adds a negligible amount of cholesterol," or "adds a dietarily insignificant amount of cholesterol;" and

(C) The food contains 2 g or less of saturated fatty acids per reference amount cutomarily consumed or, in the case of a meal product or main dish product less than 2 g of saturated fatty acids per labeled serving; and

(D) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the food. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 101.13(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim appears more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(E) As required in § 101.13(e)(2), if the food contains less than 2 mg of cholesterol per reference amount customarily consumed or in the case of a meal product or main dish product less than 2 mg of cholesterol per labeled serving without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the food (e.g., "canola oil, a cholesterol-free food, contains 14 g of fat per serving"); or

(F) If the food contains less than 2 mg of cholesterol per reference amount customarily consumed or in the case of a meal product or main dish product less than 2 mg of cholesterol per labeled serving only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meets requirements of paragraph (d)(4)(ii)(A) of this section) than the food for which it substitutes as specified in § 101.13(d) that has a significant (e.g., 5 percent or more of a national or regional market) market share. As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol was reduced are declared in immediate proximity to the most prominent such claim (e.g., "cholesterol-free margarine, contains 100 percent less cholesterol than butter"); and

(*2*) Quantitative information comparing the level of cholesterol in the product per labeled serving with that of

the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "contains no cholesterol compared with 30 mg in one serving of butter. Contains 11 g of fat per serving.").

(2) The terms "low in cholesterol," "low cholesterol," "contains a small amount of cholesterol," "low source of cholesterol," or "little cholesterol" may be used on the label or in the labeling of foods, except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) For foods that have a reference amount customarily consumed greater than 30 g or greater than 2 tablespoons and contain 13 g or less of total fat per reference amount customarily consumed and per labeled serving:

(A) The food contains 20 mg or less of cholesterol per reference amount customarily consumed;

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed; and

(C) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all foods of that type and not merely to the particular brand to which the label attaches (e.g., "low fat cottage cheese, a low cholesterol food.").

(ii) For foods that have a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and contain 13 g or less of total fat per reference amount customarily consumed, per labeled serving, and per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g refers to the "as prepared" form);

(A) The food contains 20 mg or less of cholesterol per reference amount customarily consumed and per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g refers to the "as prepared" form);

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed;

(C) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all foods of that type and not merely to the particular brand to which the label attaches (e.g., "low fat cottage cheese, a low cholesterol food").

(iii) For foods that have a reference amount customarily consumed greater than 30 g or greater than 2 tablespoons and contain more than 13 g of total fat per reference amount customarily consumed or per labeled serving,

(A) The food contains 20 mg or less of cholesterol per reference amount customarily consumed;

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed;

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the food. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 101.13(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all foods of that type and not merely to the particular brand to which the label attaches; or

(E) If the food contains 20 mg or less of cholesterol only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meets requirements of paragraph (d)(4)(ii)(A) of this section) than the food for which it substitutes as specified in § 101.13(d) that has a significant (e.g., 5 percent or more of a national or regional market) market share. As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim (e.g., "low-cholesterol peanut butter sandwich crackers, contains 83 percent less cholesterol than our regular peanut butter sandwich crackers"); and

(*2*) Quantitative information comparing the level of cholesterol in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "cholesterol lowered from 30 mg to 5 mg per serving, contains 13 g of fat per serving").

(iv) For foods that have a reference amount customarily consumed of 30 g or less or 2 tablespoons or less and contain more than 13 g of total fat per reference amount customarily consumed, per labeled serving, or per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g refers to the "as prepared" form),

(A) The food contains 20 mg or less of cholesterol per reference amount customarily consumed and per 50 g (for dehydrated foods that are typically consumed when rehydrated with only water, the per 50 g refers to the "as prepared" form),

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed;

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the food. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 101.13(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 101.13(e)(2), if the food meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all foods of that type and not merely to the particular brand to which the label attaches; or

(E) If the food contains 20 mg or less of cholesterol only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meets requirements of paragraph (d)(4)(ii)(A) of this section) than the food for which it substitutes as specified in § 101.13(d) that has a significant (i.e., 5 percent or more of a national or regional market) market share. As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim (e.g., "low-cholesterol peanut butter sandwich crackers, contains 83 percent less cholesterol than our regular peanut butter sandwich crackers"); and

(*2*) Quantitative information comparing the level of cholesterol in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., "cholesterol lowered from 30 mg to 5 mg per serving, contains 13 g of fat per serving").

(3) The terms defined in paragraph (d)(2) of this section may be used on the label and in labeling of meal products as defined in § 101.13(l) or a main dish product as defined in § 101.13(m), provided that the product meets the requirements of paragraph (d)(2) of this section except that the determination as to whether paragraph (d)(2)(i) or (d)(2)(iii) of this section applies to the product will be made only on the basis of whether the meal product contains 26 g or less of total fat per labeled serving or the main dish product contain 19.5 g or less of total fat per labeled serving, the requirement in paragraphs (d)(2)(i)(A) and (d)(2)(iii)(A) of this section shall be limited to 20 mg of cholesterol per 100 g, and the requirement in paragraphs (d)(2)(i)(B) and (d)(2)(iii)(B) of this section shall be modified to require that the food contain 2 g or less of saturated fat per 100 g rather than per reference amount customarily consumed.

(4) The terms "reduced cholesterol," "reduced in cholesterol," "cholesterol reduced," "less cholesterol," "lower cholesterol," or "lower in cholesterol" except as limited by § 101.13(j)(1)(i)(A) may be used on the label or in labeling of foods or foods that substitute for those foods as specified in § 101.13(d), excluding meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) For foods that contain 13 g or less of total fat per reference amount customarily consumed, per labeled serving, and per 50 g if the reference amount customarily consumed is 300 g or less or 2 tablespoons or less (for dehydrated food that must have water added to them prior to typical consumption, the per 50-g criterion refers to the "as prepared" form):

(A) The food has been specifically formulated, altered, or processed to reduce its cholesterol by 25 percent or more from the reference food it resembles as defined in § 101.13(j)(1) and for which it substitutes as specified in § 101.13(d) that has a significant (i.e., 5 percent or more) market share; and

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed; and

(C) As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim; and

(*2*) Quantitative information comparing the level of cholesterol in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel.

(ii) For foods that contain more than 13 g of total fat per reference amount customarily consumed, per labeled serving, or per 50 g if the reference amount customarily consumed is 30 g or less or 2 tablespoons or less (for dehydrated foods that must have water added to them prior to typical consumption, the per 50-g criterion refers to the "as prepared" form):

(A) The food has been specifically formulated, altered, or processed to reduce its cholesterol by 25 percent or more from the reference food it resembles as defined in § 101.13(j)(1) and for which it substitutes as specified in § 101.13(d) that has a significant (i.e., 5 percent or more of a national or regional market) market share;

(B) The food contains 2 g or less of saturated fatty acids per reference amount customarily consumed;

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the food. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 101.13(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim (e.g., 25 percent less cholesterol than ————————); and

(*2*) Quantitative information comparing the level of cholesterol in the product per labeled serving with that of the reference food that it replaces is declared adjacent to the most prominent claim on the information panel (e.g., "Cholesterol lowered from 55 mg to 30 mg per serving. Contains 13 g of fat per serving").

(iii) Claims described in paragraph (d)(4) of this section may not be made on the label or in labeling of a food if the nutrient content of the reference food meets the definition for "low cholesterol."

(5) The terms defined in paragraph (d)(4) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m), provided that:

(i) For meal products that contain 26.0 g or less of total fat per labeled serving or for main dish products that contain 19.5 g or less of total fat per labeled serving:

(A) The food has been specifically formulated, altered, or processed to reduce its cholesterol by 25 percent or more from the reference food it resembles as defined in § 101.13(j)(1) and for which it substitutes as specified in § 101.13(d) that has a significant (e.g., 5 percent or more of a national or regional market) market share;

(B) The food contains 2 g or less of saturated fatty acids per 100 g; and

(C) As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food, and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim (e.g., "25% less cholesterol per 3 oz than ————————."); and

(*2*) Quantitative information comparing the level of cholesterol in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim or on the information panel (e.g., Cholesterol content has been reduced from 35 mg per 3 oz to 25 mg per 3 oz).

(ii) For meal products that contain more than 26.0 g of total fat per labeled serving or for main dish products that contain more than 19.5 g of total fat per labeled serving:

(A) The food has been specifically formulated, altered, or processed to reduce its cholesterol by 25 percent or more from the reference food it resembles as defined in § 101.13(j)(1) and for which it substitutes as specified in § 101.13(d) that has a significant (e.g., 5 percent or more of a national or regional market) market share.

(B) The food contains 2 g or less of saturated fatty acids per 100 g;

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the food. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 101.13(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 101.13(j)(2) for relative claims:

(*1*) The identity of the reference food and the percent (or fraction) that the cholesterol has been reduced are declared in immediate proximity to the most prominent such claim (e.g., 25 percent less cholesterol than ————————); and

(*2*) Quantitative information comparing the level of cholesterol in the product per specified weight with that of the reference food that it replaces is declared adjacent to the most prominent claim on the information panel (e.g., "cholesterol lowered from 30 mg to 22 mg per 3 oz of product.")

(iii) Claims described in paragraph (d)(5) of this section may not be made on the label or in the labeling of a food if the nutrient content of the reference food meets the definition for "low cholesterol."

(e) *"Lean" and "extra lean" claims.* (1) The term "lean" may be used on the label or in labeling of foods except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m) provided that the food is a seafood or game meat product and as packaged contains less than 10 g total fat, less than 4 g saturated fat, and less than 95 mg cholesterol per reference amount customarily consumed and per 100 g;

(2) The term defined in paragraph (e)(1) of this section may be used on the label or in the labeling of meal products as defined in § 101.13(l) or main dish products as defined in § 101.13(m) provided that the food contains less than 10 g total fat, less than 4 g saturated fat, and less than 95 mg cholesterol per 100 g and per labeled serving;

(3) The term "extra lean" may be used on the label or in the labeling of foods except meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m) provided that the food is a discrete seafood or game meat product and as packaged contains less than 5 g total fat, less than 2 g saturated fat, and less than 95 mg cholesterol per reference amount customarily consumed and per 100 g; and

(4) The term defined in paragraph (e)(3) of this section may be used on the label or in labeling of meal products as defined in § 101.13(l) and main dish products as defined in § 101.13(m) provided that the food contains less than 5 g of fat, less than 2 g of saturated fat, and less than 95 mg of cholesterol per 100 g and per labeled serving.

(f) *Misbranding.* Any label or labeling containing any statement concerning fat, fatty acids, or cholesterol that is not in conformity with this section shall be deemed to be misbranded under sections 201(n), 403(a), and 403(r) of the Federal Food, Drug, and Cosmetic Act.

§ 101.65 Implied nutrient content claims and related label statements.

(a) *General requirements.* An implied nutrient content claim can only be made on the label and in labeling of the food if:

(1) The claim uses one of the terms described in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food is labeled in accordance with § 101.9 or 101.10, where applicable.

(b) *Label statements that are not implied claims.* Certain label statements about the nature of a product are not nutrient content claims unless such statements are made in a context that would make them an implied claim under § 101.13(b)(2). The following types of label statements are generally not implied nutrient content claims and are not subject to the requirements of § 101.13 and this section:

(1) A claim that a specific ingredient or food component is absent from a product, provided that the purpose of such claim is to facilitate avoidance of the substances because of food allergies (see § 105.62 of this chapter), food intolerance, religious beliefs, or dietary practices such as vegetarianism or other nonnutrition related reason, e.g., "100 percent milk free;"

(2) A claim about a substance that is nonnutritive or that does not have a nutritive function, e.g., "contains no preservatives," "no artificial colors;"

(3) A claim about the presence of an ingredient that is perceived to add value to the product e.g., "made with real butter," "made with whole fruit," "contains honey;"

(4) A statement of identity for a food in which an ingredient constitutes essentially 100 percent of a food, (e.g. "corn oil," "oat bran.");

(5) A statement of identity that names as a characterizing ingredient, an ingredient associated with a nutrient benefit (e.g., "corn oil margarine," "oat bran muffins," or "whole wheat bagels"), unless such claim is made in a context in which label or labeling statements, symbols, vignettes, or other forms of communication suggest that a nutrient is absent or present in a certain amount; and

(6) A label statement made in compliance with a specific provision of part 105 of this chapter, solely to note that a food has special dietary usefulness relative to a physical, physiological, pathological, or other condition, where the claim identifies the special diet of which the food is intended to be a part.

(c) *Particular implied nutrient content claims.* (1) Claims about the food or an ingredient therein that suggest that a nutrient or an ingredient is absent or present in a certain amount (e.g., "high in oat bran") are implied nutrient content claims and must comply with paragraph (a) of this section.

(2) The phrases "contains the same amount of [nutrient] as a [food]" and "as much [nutrient] as a [food]" may be used on the label or in the labeling of foods, provided that the amount of the nutrient in the reference food is enough to qualify that food as a "good source" of that nutrient, and the labeled food, on a per serving basis, is an equivalent, good source of that nutrient (e.g., "as much fiber as an apple," "Contains the same amount of Vitamin C as an 8 oz glass of orange juice.").

(3) Claims may be made that a food contains or is made with an ingredient that is known to contain a particular nutrient, or is prepared in a way that affects the content of a particular nutrient in the food, if the finished food is either "low" in or a good source of the nutrient that is associated with the ingredient or type of preparation. If a more specific level is claimed (e.g., "high in ————————"), that level of the nutrient must be present in the food. For example, a claim that a food contains oat bran is a claim that it is a good source of dietary fiber; that a food is made only with vegetable oil is a claim that it is low in saturated fat; and that a food contains no oil is a claim that it is fat free.

(d) *General nutritional claims.* (1) Claims about a food that suggest that the food because of its nutrient content may be useful in maintaining healthy dietary practices and that are made in association with an explicit claim or statement about a nutrient (e.g., "healthy, contains 3 grams of fat") are implied nutrient content claims covered by this paragraph.

(2) [Reserved]

§ 101.69 Petitions for nutrient content claims.

(a) This section pertains to petitions for claims, expressed or implied, that:

(1) Characterize the level of any nutrient which is of the type required to be in the label or labeling of food by section 403(q)(1) or (q)(2) of the Federal Food, Drug, and Cosmetic Act (the act); and

(2) That are not exempted under section 403(r)(5)(A) through (r)(5)(C) of the act from the requirements for such claims in section 403(r)(2).

(b) Petitions included in this section are:

(1) Petitions for a new (heretofore unauthorized) nutrient content claim;

(2) Petitions for a synonymous term (i.e., one that is consistent with a term defined by regulation) for characterizing the level of a nutrient; and

(3) Petitions for the use of an implied claim in a brand name.

(c) An original and one copy of the petition to be filed under the provisions of section 403(r)(4) of the act shall be submitted, or the petitioner may submit an original and a computer readable disk containing the petition. Contents of the disk should be in a standard format, such as ASCII format. Petitioners interested in submitting a disk should contact FDA's Center for Food Safety and Applied Nutrition for details. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The petition shall state the petitioner's post office address to which published notices as required by section 403 of the act may be sent.

(d) Pertinent information may be incorporated in, and will be considered as part of, a petition on the basis of specific reference to such information submitted to and retained in the files of the Food and Drug Administration. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(e) If nonclinical laboratory studies are included in a petition submitted under section 403(r)(4) of the act, the petition shall include, with respect to each nonclinical study contained in the petition, either a statement that the study has been, or will be, conducted in compliance with the good laboratory practice regulations as set forth in part 58 of this chapter or, if any such study was not conducted in compliance with such regulations, a brief statement of the reason for the noncompliance.

(f) If clinical investigations are included in a petition submitted under section 403(r)(4) of the act, the petition shall include a statement regarding each such clinical investigation relied upon in the petition that the study either was conducted in compliance with the requirements for institutional review set forth in part 56 of this chapter or was not subject to such requirements in accordance with § 56.104 or § 56.105 of this chapter, and that it was conducted in compliance with the requirements for informed consent set forth in part 50 of this chapter.

(g) The availability for public disclosure of petitions submitted to the agency under this section will be governed by the rules specified in § 10.20(j) of this chapter.

(h) All petitions submitted under this section shall include either a claim for a categorical exclusion under § 25.24 of this chapter or an environmental assessment under § 25.31 of this chapter.

(i) The data specified under the several lettered headings should be submitted on separate sheets or sets of sheets, suitably identified. If such data have already been submitted with an earlier application from the petitioner, the present petition may incorporate it by specific reference to the earlier petition.

(j) The petition must be signed by the petitioner or by his attorney or agent, or (if a corporation) by an authorized official.

(k) The petition shall include a statement signed by the person responsible for the petition, that to the best of his knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him pertinent to the evaluation of the petition.

(l) All applicable provisions of Part 10—Administrative Practices and Procedures, may be used by the Commissioner of Food and Drugs, the petitioner or any outside party with respect to any agency action on the petition.

(m)(1) Petitions for a new nutrient content claim shall include the following data and be submitted in the following form.

———————

(Date)

Name of petitioner ———————

Post office address ———————

Subject of the petition ———————

Regulations and Industry Activities Branch (HFF–312),
Food and Drug Administration,
Department of Health and Human Services,
Washington, DC 20204.

To Whom It May Concern:

The undersigned, — submits this petition under section 403(r)(4) of the Federal Food, Drug, and Cosmetic Act (the act) with respect to (statement of the claim and its proposed use).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the descriptive term and the nutrient that the term is intended to characterize with respect to the level of such nutrient. The statement should address why the use of the term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of foods on which the claim will be used. The statement shall specify the level at which the nutrient must be present or what other conditions concerning the food must be met for the use of the term in labels or labeling to be appropriate, as well as any factors that would make the use of the term inappropriate.

B. A detailed explanation, supported by any necessary data, of why use of the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that such claim would describe. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through the use of existing terms defined by regulation under section 403(r)(2)(A)(i) of the act. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose.

C. Analytical data that shows the amount of the nutrient that is the subject of the claim and that is present in the types of foods for which the claim is intended. The assays should be performed on representative samples using the Association of Official Analytical Chemists International (AOAC International) methods where available. If no AOAC International method is available, the petitioner shall submit the assay method used, and data establishing the validity of the method for assaying the nutrient in the particular food. The validation data should include a statistical analysis of the analytical and product variability.

D. A detailed analysis of the potential effect of the use of the proposed claim on food consumption and of any corresponding changes in nutrient intake. The latter item shall specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis shall specifically address the dietary practices of such

group and shall include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner ————

(Indicate authority)

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received by the agency. Such notice will inform the petitioner:

(i) That the petition is undergoing agency review (in which case a docket number will be assigned to the petition), and the petitioner will subsequently be notified of the agency's decision to file or deny the petition; or

(ii) That the petition is incomplete, e.g., it lacks any of the data required by this part, it presents such data in a manner that is not readily understood, or it has not been submitted in quadruplicate, in which case the petition will be denied, and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 100 days of the date of receipt of the petition, the Commissioner of Food and Drugs will notify the petitioner by letter that the petition has either been filed or denied. If denied, the notification shall state the reasons therefor. If filed, the date of the notification letter becomes the date of filing for the purposes of section 403(r)(4)(A)(i) of the act. A petition that has been denied shall not be made available to the public. A filed petition shall be available to the public as provided under paragraph (g) of this section.

(4) Within 90 days of the date of filing the Commissioner of Food and Drugs will by letter of notification to the petitioner:

(i) Deny the petition; or

(ii) Inform the petitioner that a proposed regulation to provide for the requested use of the new term will be published in the **Federal Register**. The Commissioner of Food and Drugs will publish the proposal to amend the regulations to provide for the requested use of the nutrient content claim in the **Federal Register** within 90 days of the date of filing. The proposal will also announce the availability of the petition for public disclosure.

(n)(1) Petitions for a synonymous term shall include the following data and be submitted in the following form.

————
(Date)
Name of petitioner ————
Post office address ————
Subject of the petition ————
Regulations and Industry Activities Branch (HFF–312),
Food and Drug Administration,
Department of Health and Human Services,
Washington, DC 20204.
To Whom It May Concern:

The undersigned, ————
submits this petition under section 403(r)(4) of the Federal Food, Drug, and Cosmetic Act (the act) with respect to (statement of the synonymous term and its proposed use in a nutrient content claim that is consistent with an existing term that has been defined under section 403(r)(2) of the act).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the synonymous descriptive term, the existing term defined by a regulation under section 403(r)(2)(A)(i) of the act with which the synonymous term is claimed to be consistent. The statement should address why the proposed synonymous term is consistent with the term already defined by the agency, and why the use of the synonymous term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of foods on which the claim will be used. The statement shall specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

B. A detailed explanation, supported by any necessary data, of why use of the proposed term is requested, including an explanation of whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. This item shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through the use of existing term defined by regulation. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose.

Yours very truly,
Petitioner ————
By ————
(Indicate authority)

(2) Within 15 days of receipt of the petition the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner:

(i) That the petition is undergoing agency review (in which case a docket number will be assigned to the petition) and the petitioner will subsequently be notified of the agency's decision to grant the petitioner permission to use the proposed term or to deny the petition; or

(ii) That the petition is incomplete, e.g., it lacks any of the data required by this part, it presents such data in a manner that is not readily understood, or it has not been submitted in quadruplicate, in which case the petition will be denied, and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 90 days of the date of receipt of the petition that is accepted for review (i.e., that has not been found to be incomplete and consequently denied, the Commissioner of Food and Drugs will notify the petitioner by letter of the agency's decision to grant the petitioner permission to use the proposed term, with any conditions or limitations on such use specified, or to deny the petition, in which case the letter shall state the reasons therefor. Failure of the petition to fully address the requirements of this section shall be grounds for denial of the petition.

(4) As soon as practicable following the agency's decision to either grant or deny the petition, the Commissioner of Food and Drugs will publish a notice in the **Federal Register** informing the public of his decision. If the petition is granted the Food and Drug Administration will list, the approved synonymous term in the regulations listing terms permitted for use in nutrient content claims.

(o)(1) Petitions for the use of an implied nutrient content claim in a brand name shall include the following data and be submitted in the following form:

————
(Date)
Name of petitioner ————
Post office address ————
Subject of the petition ————
Regulations and Industry Activities Branch (HFF–312),
Food and Drug Administration,
Department of Health and Human Services,
Washington, DC 20204.
To Whom It May Concern:

The undersigned, ————
submits this petition under section 403(r)(4) of the Federal Food, Drug, and Cosmetic Act (the act) with respect to (statement of the implied nutrient content claim and its proposed use in a brand name).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the implied nutrient content claim, the nutrient the claim is intended to

characterize, the corresponding term for characterizing the level of such nutrient as defined by a regulation under section 403(r)(2)(A)(i) of the act, and the brand name of which the implied claim is intended to be a part. The statement should address why the use of the brandname as proposed will not be misleading. It should address in particular what information is required to accompany the claim or other ways in which the claim meets the requirements of sections 201(n) and 403(a) of the act. The statement should provide examples of the types of foods on which the brand name will appear. It shall also include data showing that the actual level of the nutrient in the food qualifies the food to bear the corresponding term defined by regulation. Assay methods used to determine the level of a nutrient should meet the requirements stated under petition format item C in paragraph (k)(1) of this section.

B. A detailed explanation, supported by any necessary data, of why use of the proposed brand name is requested. This item shall also state what nutritional benefit to the public will derive from use of the brand name as proposed. If the branded product is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group and should include scientific data sufficient for such purpose.

Yours very truly,

Petitioner ————————

By ————————

(2) Within 15 days of receipt of the petition the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner:

(i) That the petition is undergoing agency review (in which case a docket number will be assigned to the petition); or

(ii) That the petition is incomplete, e.g., it lacks any of the data required by this part, it presents such data in a manner that is not readily understood, or it has not been submitted in quadruplicate, in which case the petition will be denied, and the petitioner will be notified as to what respect the petition is incomplete.
